P.)

LIVERPOOL, Charles Jenkinson, first Earl of (1727–1808), was the eldest son of Colonel Jenkinson, Walcot, Oxfordshire, where he was born 16th May, 1727. He was educated at Charterhouse school and at University College, Oxford, where after a career of special distinction he graduated M. A. in 1752. Almost immediately on entering parliament as member for Cockermouth in 1761, he was appointed under-secretary of state under Lord Bute, and, as he soon shared equally with that nobleman the favor of the king, his political advancement was rapid and uninterrupted while the friends of the king remained in office. By Grenville he was in 1763 appointed secretary of state; in the Grafton administration he, in 1766, obtained a seat at the Admiralty Board; and from 1778 till the close of Lord North's ministry he was secretary at war. On the accession of Pitt to power in 1784, he became president of the Board of Trade, retaining office till Pitt's resignation in 1801. Besides direct political power he also enjoyed a large share both of substantial and honorary political rewards. In 1773 he became member of the privy council, and obtained the vice-treasurership of Ireland, which he afterwards exchanged for the clerkship of the pells; and from 1786 to 1802 he was chancellor of the duchy of Lancaster. In 1786 he was created Baron Hawkesbury, and ten years afterwards earl of Liverpool. He died 17th December, 1808. Lord Liverpool was generally believed to be the chief political adviser of George III. His prudence, practical talents, and knowledge of the details both of home and foreign politics rendered him a specially safe and useful member of a cabinet.

He was the author of several political works, which display industry and discrimination, but, with the exception of his well-known *Treatise on the Coins of the Realm*, 1805, are without striking merits. His other writings are—*National and Constitutional Force in England*, 1756; *Treaties between Great Britain and other Powers, 1648–1783*, 3 vols., 1785; *The Conduct of Great Britain in respect to Neutral Nations, 1785*, 3 vols., 1801.

LIVERPOOL, Robert Banks Jenkinson, second Earl of (1770–1828), son of the above by his first wife Amelia, daughter of Mr. Watts, governor of Bengal, was born June 7, 1770. He was educated at Charterhouse and at Christ Church, Oxford, where he had Canning, afterwards his close political associate, for a contemporary. In 1791 he entered parliament as member for Rye, but he first held office in 1801 as foreign secretary in Addington's administration, when he conducted the negotiations for the abortive treaty of Amiens. On the accession of Pitt to power in 1804, he obtained the home office, and till his elevation to the House of Peers he acted as leader of the party in the House of Commons. He declined the premiership on the death of Pitt in 1806, and remained out of office till the accession of Perceval in 1809, when he again became home secretary. After the assassination of Perceval in 1812 he became prime minister, and retained office till compelled in February, 1827, to resign by the illness (paralysis) which terminated his life, 4th December, 1828. The political career of Lord Liverpool was entirely of a negative character so far as legislation was concerned; the only principle which regulated his statesmanship was persistent opposition to every kind of change, especially in the direction of increased religious or political liberty. From the beginning he strongly resisted Catholic emancipation, and he was also prominent in delaying the emancipation of the slaves. The energy of Castlereagh and Canning secured the outward success of the foreign policy of the cabinet, but in his home policy he was always unfortunate and retrograde. The Pains and Penalties Bill against Queen Caroline greatly increased his unpopularity, first originated by the severe measures of repression employed to quell the general distress, which had been created by undue taxation and was aggravated by blind adherence to protection. Though, therefore, actuated throughout by an honesty beyond all question, and though always commanding the sincere respect of his opponents by his dignified and considerate bearing, Lord Liverpool was destitute of wide and genial sympathies, and of true political insight, and his resignation of office was followed almost immediately by the complete and permanent reversal of his domestic policy.

LIVERWORTS. The Liverworts or *Hepaticæ* constitute a group of the higher *Cryptogamia*, allied to the mosses. Their shoots are either *thalloid*, in some genera (*Marchantia*) highly differentiated in structure, in others (*Anthoceros*) of simple homogeneous texture, with an upper and lower surface, the latter fixed to the ground by capillary rootlets, and generally margined with minute scales; or they are *foliose*, the central stem bearing on each side a row of leaves, consisting of one series of cells invested with a structureless epidermis, and destitute of nerves, such as prevail in the leaves of mosses. Frequently on the inferior aspect a third row of leaf-like scales is found, differing from the former, and known as stipules, bracteoles, or amphigastria. Hence the shoots, although typically trilateral, often appear bilateral. The reproductive organs of the *Hepaticæ* are of two kinds—sexual and asexual.

I. The sexual germs of the mosses and *Hepaticæ* were first described by Hedwig just one hundred years ago (1782). They consist, as in the higher plants, of germ-cells and sperm-cells. As the fronds approach maturity the terminal leaves become modified so as to form an involucrum, within which a special covering appears, the colesule or perianth, surrounding the pistillidia; this is tubular, conical, or compressed in form, with the mouth plicate and generally dentate.

On section of the colesule a number of minute flask-

shaped bodies are found, attached to the apex of the stem, which have been named archigonia or pistillidia. After fertilization one of these enlarges, active cell formation proceeding from the central cell at the base, within which appears the germ-cell, which in time becomes the capsule, the ultimate contents producing spores arranged in fours, and elongated cells bearing within spiral filaments (elaters). Until the maturity of the spores, the sporangium remains at the base of the colcsule, but at length the outer coat (calyptra) ruptures near the summit, and by the rapid evolution of the cells of the fruit-stalk (seta) the capsule is borne upwards. At this stage, which is of brief duration, the fronds look as if dotted with black-headed pins on white stalks. Released from pressure, the hygrometric action of the elater soon ruptures the wall of the capsule, which divides, in the majority of species, into four valves, and the spores are scattered around.

The antheridia are sometimes found imbedded in crypts within the substance of the thallus (*Riccia*), or in special receptacles either sessile or raised above the surface of the same (*Marchantia*). In the foliose *Hepaticæ* they are usually seated in the axils of modified leaves (perigonial), sometimes appearing beneath the fertile involucra (monœcious), or on special branches of the same plant (paroecious), or they occur on separate plants (dicœcious). The antheridia are much smaller than the capsules, spherical or ovoid in form, and seated on a short footstalk. They are invested with a single coat of tabular cells. Before maturity they are greenish, but when ripe their color turns to yellow. On pressure they rupture irregularly, and allow the escape of crowds of lenticular cells, which revolve actively under the microscope until the ciliated phytozoa within them are released.

The phytozoa of mosses were first figured by Unger (1834), who described them as consisting of a thick body, and a thin thread-like prolongation, which goes in advance when the body is in motion, and is spiral in form. Thuret has since shown that the so-called "tail" bears two long oscillating cilia. Hofmeister first observed the formation of the free germinal vesicle within the basal cell of the pistillidium as the direct result of fertilization.

II. *Asexual Germs.*—Beyond the true fructification, in the majority of *Hepaticæ*, certain bodies are met with, which are known as gemmæ, but which differ from each other in complexity and significance.

(1) In some *Marchantiæ* basket-like or crescentic receptacles are found, containing lenticular bodies, which, under favorable conditions, will produce new fronds.

(2) On the borders of the leaves, especially near the apex of the shoots, prolification from the ordinary cellular tissue is met with in most *Hepaticæ*, in the form of detached cells or tufts of such cells. These are generally described as gemmæ, but resemble more closely the *gonidia* of lichens, and probably aid in the diffusion of dicœcious species, which from the absence of ♂ or ♀ plants would otherwise become extinct.

(3) Another process has been ascribed to gemmation, but has been more happily named by Dr. A. Braun *rejuvenescence* (*Verjungung*). In decayed or apparently withered fronds, certain cells, after a period of rest, assume new activity and multiply so as to give rise to new individuals (*Anthoceros*, *Riccia*, etc.).

Distinction between Hepaticæ and Musci.—There is scarcely a character in the definition of *Hepaticæ* which might not refer to some genus of mosses, although the definition as a whole may be sufficiently distinctive, and practically there is no difficulty in distinguishing one from the other.

In *Musci* the urn-case or capsule generally opens by means of a lid, and the mouth is surrounded by a peristome divided into four, eight, or more teeth. A columella is nearly always present, and the spores ripen in a sac between the former and the walls of the capsule. From the early elongation of the fruit rudiment, the calyptra is ruptured at an earlier stage, the upper part investing the urn-case like a cap, during the development of the spores; the lower remnant remains at the base of the seta (which, as well as the capsule, is composed of more ligneous texture than in *Hepaticæ*) as the vaginula. The spore gives rise to a confervoid prothallus, often extensively branched, and from this the leaf-buds arise. The leaves are imbricated on all sides of the stem, and the phyllotaxis is usually $\frac{1}{2}$, $\frac{2}{5}$, or $\frac{3}{8}$. The leaves are frequently strengthened by a midrib, and the rootlets are divided by numerous septa.

Habitat.—The *Hepaticæ* are cosmopolitan in range, and form a relatively important average of the alpine vegetation, being abundant in moist, equable and insular places, *e. g.*, Ireland, Scotland, New Zealand. They are also met with in more tropical zones, such as South America, India, Java, and the West Indies.

Classification.

I. *Marchantiaceæ.*—Fronds thalloid, prostrate, furcate; epidermis pierced with curious stomata; inner section areolate, occupied by green gonidial cells, lower surface simply cellular, emitting long rootlets, papillose within.

(*a*) *Marchantieæ.*—Capsules aggregate on a stalked receptacle: *e. g.*, *Marchantia*, *Asterella*, *Fegatella*, *Dumortiera*, *Lunularia*, etc.

(*b*) *Targonieæ.*—Antheridia immersed; involucre like a split pea; capsule nearly sessile, below the apex.

(*c*) *Ricciæ.*—Antheridia and pistillidia immersed, the latter emitting the spores by the decay of the walls; spores without elaters: *e. g.*, *Riccia*, *Ricciella*, etc.

II. *Jungermanniaceæ.*—Capsule solitary terminal on the primary shoots or on short lateral ones, splitting into four valves.

* *Foliosæ.*

(*a*) Leaves *succubous*: *e. g.*, *Jungermannia*, *Scapania*, *Lophocolea*, etc.

(*b*) Leaves *incubous*: *e. g.*, *Lijennia*, *Frullania*, *Schisma*, *Lepidozia*, etc.

* * *Frondosæ*: *e. g.*, *Pellia*, *Blasia*, *Petalophyllum*, etc.

III. *Anthoceroteæ.*—Capsule horn or pod-like, opening by one or two valves, columella central, spores intermingled with deformed elaters: *e. g.*, *Anthoceros*, *Monoclæa*.

Uses.—At the present time the *Hepaticæ* are of little practical use to man. In the dark ages of medicine, when the doctrine of "signatures" was in fashion, the strongly-marked epidermic cells were supposed to resemble the structure of the liver, and the species were esteemed "a sovran remedy" in liver complaints. The *Hepatica fontana* (*Marchantia polymorpha*) of Casper Bauhine, "which grows near springs, wells, and watery places, very lowe, almost like a moss and puts out flowers about June, not unlike *stars*," is wonderfully commended by Schröder, in those disorders of the liver which arise from too much heat (*English Dispensary*, 1733). A few species possess a pungent, bitter taste (*Porella*) resembling that of *Sedum acre*. Many also evolve a musky odor, observable in the woods and fields after rain, and incorrectly referred to the smell of moist earth.

Beyond the beauty of tint and outline, which light up many a dreary ravine, they supply abundant material for the microscope, enabling us by the translucency of tissue, and their easy preservation, so long as moisture is supplied, to study cell and leaf structure, and the wonders of reproduction, as no other class will do.

Lastly, many fern-growers have of late included the *Hepaticæ* and *Musci* in their list of favorites, the variety adding immeasurably to the interest of their collections. Most of the species are readily cultivated in a cold frame or fernery, the atmosphere of which must be kept moist and equable. In the renowned ferneries of Mr. Backhouse of York, A. Stansfield of Todmorden, and the Glasnevin Gardens, Dublin, species have long been cultivated, many foreign to the climate, and introduced with foreign plants. (B. C.)

LIVINGSTON, Edward (1764–1836), American jurist and statesman, was born in Clermont, Columbia county, New York, May 26, 1764. He was a great-grandson of Robert Livingston, the first possessor under royal patent of "Livingston Manor," a tract of land on the Hudson, comprising the greater part of the present counties of Dutchess and Columbia. Having graduated at Princeton in 1781, he began to practise law in New York city, and rapidly rose to distinction as an advocate. He was a member of congress during 1794–98, and in 1801 was appointed United States district attorney for the State of New York, and while retaining that position was also elected mayor of New York city, then an office of high dignity and emolument. In the summer of 1803 New York was visited with a violent epidemic of yellow fever, during which Livingston dis-

played great courage and energy in his endeavors to prevent the spread of the disease, and to relieve the widespread distress. He suffered an attack of the fever in its most violent form, during which the people of the city gave many proofs of their attachment and anxiety. He recovered to find his private affairs, which he had neglected, in some confusion, and he was at the same time deeply indebted to the Government for public funds which had been lost through the mismanagement of a confidential clerk. Livingston at once surrendered all his property, and, having resigned his offices, removed to Louisiana, which had then just been ceded by France to the United States. He soon acquired a large law practice in New Orleans, and repaid the Government in full. Almost immediately upon his arrival in Louisiana he was appointed by the legislature to prepare a provisional code of judicial procedure, which was continued in force from 1805 to 1825. During the short war with England in 1814–15, Livingston was active in rousing the mixed population of New Orleans to resistance, and acted as adviser and aide-de-camp to Jackson. In 1821, by appointment of the legislature, Livingston began the preparation of a new code of criminal law and procedure, since widely known in Europe and America as the "Livingston Code." It was prepared in both French and English, as required by the necessities of practice in Louisiana, and, though substantially completed in 1824, and in greater part then adopted by the State, it was not printed entire until 1833. It was at once reprinted in England, France, and Germany, attracting wide interest and praise from the most distinguished sources by its remarkable simplicity and vigor, and more especially by reason of its philanthropic provisions, which have noticeably influenced the penal legislation of several countries. Livingston was a member of congress during 1823–29, was afterwards senator, and for two years secretary of state under President Jackson. From 1833 to 1835 he was minister plenipotentiary to France, and conducted with success negotiations of considerable difficulty and importance. He died May 23, 1836.[1]

See Livingston's *Life* by C. H. Hunt (New York, 1864), and his complete *Works* (2 vols., 1873).

LIVINGSTON, Robert R. (1746–1813), American statesman, brother of Edward Livingston noticed above, was born at New York, November 27, 1746. He graduated at King's College, New York, at the age of nineteen, became a practitioner of law, and, in 1773, recorder of the city, but was soon displaced by loyalist influence because of his sympathies with the revolution. In 1776 he was a member of the committee of congress which drew up the Declaration of Independence, and in 1777 was a prominent member of the convention at Kingston, which framed the first constitution of New York. Upon the adoption of that instrument in the same year he became the first chancellor of the State, which office he held until 1801, whence he is best known as "Chancellor" Livingston. He administered the oath of office to Washington at his first inauguration to the presidency in New York, April 30, 1789. In 1801 he was appointed by President Jefferson as minister to France, and in 1803 effected in behalf of his Government the purchase from France of the vast territory then known as Louisiana, comprising the entire territory between the Mississippi and the Rocky Mountains, from the Spanish to the British possessions. This was, perhaps, the most important transfer of territory by purchase ever made, but none of those who participated in it realized its importance. Napoleon's agent obtained ten million francs more than he had been instructed to accept for the cession, and Jefferson and Livingston were at the time bitterly censured for rashly concluding so useless a purchase. In 1804 Livingston withdrew from public life, and after spending a year in travel in Europe, returned to New York, where he occupied his remaining years in promoting various improvements in agriculture. He also assisted Fulton in his invention of the steamboat. He died in February, 1813.

[1] [His Uncle Philip (1716–78), of New York, was a Yale graduate, signed the Declaration of Independence, and died at York, Pa., while attending a session of the Continental Congress.—Am. Ed.]

LIVINGSTONE, David (1813–1873), missionary and explorer, was born on March 19, 1813, at the village of Blantyre Works, in Lanarkshire, Scotland. David was the second child of his parents Neil Livingston (for so he spelled his name, as did his son for many years) and Agnes Hunter. His parents were poor and self-respecting, typical examples of all that is best among the humbler families of Scotland. At the age of ten years David left the village school for the neighboring cotton-mill, and by strenuous efforts he qualified himself at the age of twenty-three to undertake a college curriculum. He attended for two sessions the medical and the Greek classes in Anderson's College, and also a theological class. In September, 1838, he went up to London, and was accepted by the London Missionary Society as a candidate. During the next two years he resided mostly in London, diligently attending medical and science classes, and spending part of his time with the Rev. Mr. Cecil at Ongar in Essex, studying theology and learning to preach. He took his medical degree in the Faculty of Physicians and Surgeons in Glasgow in November, 1840. Livingstone had from the first set his heart on China, and it was a great disappointment to him that the Society finally decided to send him to Africa. To an exterior in these early years somewhat heavy and uncouth, he united a manner which, by universal testimony, was irresistibly winning, with a fund of genuine but simple humor and fun that would break out on the most unlikely occasions, and in after years enabled him to overcome difficulties and mellow refractory chiefs when all other methods failed.

Livingstone sailed from England on December 8, 1840. From Algoa Bay he made direct for Kuruman, the mission station, 700 miles north, established by Hamilton and Moffat thirty years before, and there he arrived on July 31, 1841. The next two years Livingstone spent in travelling about the country to the northwards, in search of a suitable outpost for settlement. During these two years he had already become convinced that the success of the white missionary in a field like Africa is not to be reckoned by the tale of doubtful conversions he can send home each year,—that the proper work for such men was that of pioneering, opening up and starting new ground, leaving native agents to work it out in detail. The whole of his subsequent career was a development of this idea. He selected the valley of Mabotsa, on one of the sources of the Limpopo river, 200 miles north-east of Kuruman, as his first station. It was shortly after his settlement here that he was attacked by a lion, which crushed his left arm and nearly put an end to his career. The arm was imperfectly set, and it was a source of trouble to him at times throughout his life, and was the means of identifying his body after his death. To a house, mainly built by himself at Mabosta, Livingstone in 1844 brought home his wife, Mary Moffat, the daughter of Moffat of Kuruman. Here he labored till 1846, when he removed to Chonuane, 40 miles further north, the chief place of the Bakwain tribe under Sechele. In 1847 he again removed to Kolobeng, about 40 miles westwards, the whole tribe following their missionary. With the help of and in the company of two English sportsmen, Mr. Oswell and Mr. Murray, he was able to undertake a journey of great importance to Lake Ngami, which had never yet been seen by a white man. Crossing the Kalahari Desert, of which Livingstone gave the first detailed account, they reached the lake on August 1, 1849. In April next year he made an attempt to reach Sebituane, who lived 200 miles beyond the lake, this time in company with his wife and children, but again got no further than the lake, as the children were seized with fever. A year later, April, 1851, Livingstone, again accompanied by his family and Mr. Oswell, set out, this time with the intention of settling among the Makololo for a period. At last he succeeded, and reached the Chobe, a southern tributary of the Zambesi, and in the end of June discovered the Zambesi itself at the town of Sesheke. Leaving the Chobe on August

13, the party reached Capetown in April, 1852. Livingstone may now be said to have completed the first period of his career in Africa, the period in which the work of the missionary had the greatest prominence. Henceforth he appears more in the character of an explorer, but it must be remembered that he regarded himself to the last as a pioneer missionary, whose work was to open up the country to others.

Having, with a sad heart, seen his family off to England, Livingstone left the Cape on June 8, 1852, and reached Linyanti, the capital of the Makololo, on the Chobe, on May 23, 1853, received in royal style by Sekeletu, and welcomed by all the people. His first object in this journey was to seek for some healthy high land in which to plant a station. Ascending the Zambesi, he, however, found no place free from the destructive tsetse insect, and therefore resolved to discover a route to the interior from either the west or east coast. To accompany Livingstone in his hazardous undertaking twenty-seven men were selected from the various tribes under Sekeletu, partly with a view to open up a trade route between their own country and the coast. The start was made from Linyanti on November 11, 1853, and, by ascending the Leeba, Lake Dilolo was reached on February 20, 1854. On April 4 the Coango was crossed, and on May 31 the town of Loanda was entered, much to the joy of the men,—their leader, however, being all but dead from fever, semi-starvation, and dysentery. Livingstone speaks in the warmest terms of the generosity of the Portuguese merchants and officials. From Loanda Livingstone sent his astronomical observations to Maclear at the Cape, and an account of his journey to the Royal Geographical Society, which in May, 1855, awarded him its highest honor, its gold medal. Loanda was left on September 20, 1854, but Livingstone lingered long about the Portuguese settlements. Making a slight detour to the north to Cabango, the party reached Lake Dilolo on June 13. Here Livingstone made a careful study of the watershed of the country in what is perhaps the most complicated river system in the world. He "now for the first time apprehended the true form of the river systems and the continent," and the conclusions he came to have been essentially confirmed by subsequent observations. The return journey from Lake Dilolo was by the same route as that by which the party came. Their reception all along the Barotse valley was an ovation, and Linyanti was reached in the beginning of September.

For Livingstone's purposes the route to the west was unavailable, and he decided to follow the Zambesi to its mouth. With a numerous following, he left Linyanti on November 8, 1855. A fortnight afterwards he made the great discovery with which, in popular imagination, his name is more intimately associated than with anything else he did,—the famous "Victoria" falls of the Zambesi, which, after a second examination in his subsequent journey, he concluded to be due to an immense fissure or fault right across the bed of the river, which was one means of draining off the waters of the great lake that he supposed must have at one time occupied the centre of the continent. He had already formed a true idea of the configuration of the continent as a great hollow or basin-shaped plateau, surrounded by a ring of mountains. Livingstone reached the Portuguese settlement of Tette on March 2, 1856, in a very emaciated condition, and after six weeks, left his men well cared for, and proceeded to Kilimane, where he arrived on May 20, thus having completed in two years and six months one of the most remarkable and fruitful journeys on record. The results in geography and in natural science in all its departments were abundant and accurate; his observations necessitated a reconstruction of the map of central Africa. Men of the highest eminence in all departments of science testified to the high value of Livingstone's work. In later years, it is true, the Portuguese, embittered by his unsparing denunciations of their traffic in slaves, attempted to depreciate his work, and to maintain that much of it had already been done by Portuguese explorers. When Livingstone began his work in Africa it was virtually a blank from Kuruman to Timbuctoo, and nothing but envy or ignorance can throw any doubt on the originality of his discoveries.

On December 12 he arrived in England, after an absence of sixteen years, and met everywhere with the welcome of a hero. He told his story in his *Missionary Travels and Researches in South Africa* (1857) with straightforward simplicity, and with no effort after literary style, and no apparent consciousness that he had done anything extraordinary. Its publication brought what he would have considered a competency had he felt himself at liberty to settle down for life. In 1857 he severed his connection with the London Missionary Society, with whom, however, he always remained on the best of terms, and in February, 1858, he accepted the appointment of "Her Majesty's consul at Kilimane for the eastern coast and the independent districts in the interior, and commander of an expedition for exploring eastern and central Africa."

The Zambesi expedition, of which Livingstone thus became commander, sailed from Liverpool in H. M. S. "Pearl" on March 10, 1858, and reached the mouth of the Zambesi on May 14, and the party ascended the river from the Kongone mouth in a steam launch, the "Ma-Robert," reaching Tette on September 8. The remainder of the year was spent in examining the river above Tette, and especially the Kebrabasa rapids. Most of the year 1859 was spent in the exploration of the river Shire and Lake Nyassa, which was discovered in September; and much of the year 1860 was spent by Livingstone in fulfilling his promise to take such of the Makololo home as cared to go. In January of next year arrived Bishop Mackenzie and a party of missionaries sent out by the Universities Mission to establish a station on the upper Shire.

After exploring the river Rovuma for 30 miles in his new vessel the "Pioneer," Livingstone and the missionaries proceeded up the Shire to Chibisa's; there they found the slave-trade rampant, desolating the country and paralyzing all effort. On July 15 Livingstone, accompanied by several native carriers, started to show the bishop the country. Several bands of slaves whom they met were liberated, and after seeing the missionary party settled in the highlands of Magomero to the south of Lake Shirwa, Livingstone spent from August to November in exploring Lake Nyassa. While the boat sailed up the west side of the lake to near the north end, the explorer marched along the shore. He returned more resolved than ever to do his utmost to rouse the civilized world to put down the desolating slave-trade. On January 30, 1862, at the Zambesi mouth, Livingstone welcomed his wife and the ladies of the mission, with whom were the sections of the "Lady Nyassa," a river steamer which Livingstone had had built at his own expense, absorbing most of the profits of his book, and for which he never got any allowance. When the mission ladies reached the mouth of the Ruo tributary of the Shire, they were stunned to hear of the death of the bishop and of Mr. Burrup. This was a sad blow to Livingstone, seeming to have rendered all his efforts to establish a mission futile. A still greater loss to him was that of his wife at Shupanga, on April 27, 1862.

The "Lady Nyassa" was taken to the Rovuma. Up this river Livingstone managed to steam 156 miles, but further progress was arrested by rocks. Returning to the Zambesi in the beginning of 1863, he found that the desolation caused by the slave-trade was more horrible and widespread than ever. It was clear that the Portuguese officials were themselves at the bottom of the traffic. Kirk and Charles Livingstone being compelled to return to England on account of their health, the doctor resolved once more to visit the lake, and proceeded some distance up the west side and then north-west as far as the watershed that separates the

Loangwa from the rivers that run into the lake. Meanwhile a letter was received from Earl Russell recalling the expedition by the end of the year. In the end of April, 1864, Livingstone reached Zanzibar in the "Lady Nyassa," and on the 30th he set out with nine natives and four Europeans for Bombay, which was reached after an adventurous voyage of a month, and on July 23 Livingstone arrived in England. He was naturally disappointed with the results of this expedition, all its leading objects being thwarted through no blame of his. For the unfortunate disagreements which occurred, and for which he was blamed in some quarters, he must be held acquitted, as he was by the authorities at home; though it is not necessary to maintain that Livingstone was exempt from the trying effects on the temper of African fever, or from the intolerance of lukewarmness which belongs to all exceptionally strong natures. Still the results at the time, and especially those of the future, were great. The geographical results, though not in extent to be compared to those of his first and his final expeditions, were of high importance, as were those in various departments of science. Details will be found in his *Narrative of an Expedition to the Zambesi and its Tributaries*, published in 1865.

By Murchison and his other staunch friends Livingstone was as warmly welcomed as ever. When Murchison proposed to him that he should go out again, although he seems to have had a desire to spend the remainder of his days at home, the prospect was too tempting to be rejected. He was appointed H. M. consul to central Africa without a salary, and Government contributed only £500 to the expedition. The chief help came from private friends. During the latter part of the expedition Government granted him £1000, but that, when he learned of it, was devoted to his great undertaking. The Geographical Society contributed £500. The two main objects of the expedition were the suppression of slavery by means of civilizing influences, and the ascertainment of the watershed in the region between Nyassa and Tanganyika. At first Livingstone thought the Nile problem had been all but solved by Speke, Baker, and Burton, but the idea grew upon him that the Nile sources must be sought farther south. and his last journey became in the end a forlorn hope in search of the "fountains" of Herodotus. Leaving England in the middle of August, 1865, *via* Bombay, Livingstone arrived at Zanzibar on January 28, 1866. He was landed at the mouth of the Rovuma on March 22, and started for the interior on April 4. His company consisted of thirteen sepoys, ten Johanna men, nine African boys from Nassick school, Bombay, and four boys from the Shire region, besides camels, buffaloes, mules, and donkeys. This imposing outfit soon melted away to four or five boys. Rounding the south end of Lake Nyassa, Livingstone struck in a north-north-west direction for the south end of Lake Tanganyika, over country much of which had not previously been explored. The Loangwa was crossed on December 15, and on Christmas day Livingstone lost his four goats, a loss which he felt very keenly, and the medicine chest was stolen in January, 1868. Fever came upon him, and for a time was his almost constant companion; this, with the fearful dysentery and dreadful ulcers and other ailments which subsequently attacked him, and which he had no medicine to counteract, no doubt told fatally on even his iron frame. The Chambeze was crossed on January 28, and the south end of Tanganyika reached March 31. Here, much to his vexation, he got into the company of Arab slave dealers, by whom his movements were hampered; but he succeeded in reaching Lake Moero. After visiting Lake Mofwa and the Lualaba, which he believed was the upper part of the Nile, he, on July 18, discovered Lake Bangweolo. Proceeding up the west coast of Tanganyika, he reached Ujiji on March 14, 1869, "a ruckle of bones." Supplies had been forwarded to him at Ujiji, but had been knavishly made away with by those to whose care they had been entrusted. Livingstone recrossed Tanganyika in July, and through the country of the Manyuema he tried in vain, for a whole year, to reach and cross the Lualaba, baffled partly by the natives, partly by the slave hunters, and partly by his long illnesses. It was, indeed, not till March 29, 1871, that he succeeded in reaching the Lualaba, at the town of Nyangwe, where he stayed four months, vainly trying to get a canoe to take him across. It was here that a party of Arab slavers, without warning or provocation, assembled one day when the market was busiest and commenced shooting down the poor women, hundreds being killed or drowned in trying to escape. Livingstone had "the impression that he was in hell," but was helpless, though his "first impulse was to pistol the murderers." The account of this scene which he sent home roused indignation in England to such a degree as to lead to determined and to a considerable extent successful efforts to get the sultan of Zanzibar to suppress the trade. In sickened disgust the weary traveller made his way back to Ujiji, which he reached on October 13. Five days after his arrival in Ujiji he was cheered and inspired with new life, and completely set up again, as he said, by the timely arrival of Mr. H. M. Stanley, the richly laden almoner of Mr. Gordon Bennett, of the *New York Herald*. Mr. Stanley's residence with Livingstone was almost the only bright episode of these last sad years. With Stanley Livingstone explored the north end of Tanganyika, and proved conclusively that the Lusize runs into and not out of it. In the end of the year the two started eastward for Unyanyembe, where Stanley provided Livingstone with an ample supply of goods, and bade him farewell. Stanley left on March 15, 1872, and after Livingstone had waited wearily at Unyanyembe for five months, a troop of fifty-seven men and boys arrived, good and faithful fellows on the whole, selected by Stanley himself. Thus attended, he started on August 15 for Lake Bangweolo, proceeding along the east side of Tanganyika. His old enemy dysentery soon found him out. In January, 1873, the party got among the endless spongy jungle on the east of Lake Bangweolo, Livingstone's object being to go round by the south and away west to find the "fountains." Vexatious delays took place, and the journey became one constant wade below, under an almost endless pour of rain from above. The doctor got worse and worse, but no idea of danger seems to have occurred to him. At last, in the middle of April, he had unwillingly to submit to be carried on a rude litter. On April 29 Chitambo's village on the Lulimala, in Ilala, on the south shore of the lake, was reached. The last entry in the journal is April 27:—"Knocked up quite, and remain—recover—sent to buy milch goats. We are on the banks of the Molilamo." On April 30 he with difficulty wound up his watch, and early on the morning of May 1 the boys found "the great master," as they called him, kneeling by the side of his bed, dead. His faithful men preserved the body in the sun as well as they could, and wrapping it carefully up, carried it and all his papers, instruments, and other things across Africa to Zanzibar. It was borne to England with all honor, and on April 18, 1874, was deposited in Westminster Abbey, amid tokens of mourning and admiration such as England accords only to her greatest sons. Government bore all the funeral expenses. His faithfully kept journals during these seven years' wanderings were published under the title of the *Last Journals of David Livingstone in Central Africa*, in 1874, edited by his old friend the Rev. Horace Waller.

In spite of his sufferings and the many compulsory delays, Livingstone's discoveries during these last years were both extensive and of prime importance as leading to a solution of African hydrography. No single African explorer has ever done so much for African geography as Livingstone during his thirty years' work. His travels covered one-third of the continent, extending from the Cape to near the equator, and from the Atlantic to the Indian Ocean. Livingstone was no hur-

ried traveller; he did his journeying leisurely, carefully observing and recording all that was worthy of note, with rare geographical instinct and the eye of a trained scientific observer, studying the ways of the people, eating their food, living in their huts, and sympathizing with their joys and sorrows. It will be long till the tradition of his sojourn dies out among the native tribes, who almost, without exception, treated Livingstone as a superior being; his treatment of them was always tender, gentle, and gentlemanly. But the direct gains to geography and science are perhaps not the greatest results of Livingstone's journeys. He conceived, developed, and carried out to success a noble and many-sided purpose, with an unflinching and self-sacrificing energy and courage that entitle him to take rank among the great and strong who single-handed have been able materially to influence human progress and the advancement of knowledge. His example and his death have acted like an inspiration, filling Africa with an army of explorers and missionaries, and raising in Europe so powerful a feeling against the slave-trade that it may be considered as having received its deathblow. Personally Livingstone was a pure and tender-hearted man, full of humanity and sympathy, simple-minded as a child. The motto of his life was the advice he gave to some school children in Scotland,—"Fear God, and work hard."

See, besides his own narratives and Dr. Blaikie's *Life*, the publications of the London Missionary Society from 1840, the *Proceedings of the Royal Geographical Society*, the despatches to the Foreign Office sent home by Livingstone during his last two expeditions, and Mr. H. M. Stanley's *How I Found Livingstone*. (J. S. K.)

LIVIUS ANDRONICUS occupies the position of the oldest among the recognized poets of Rome. He determined the course which Roman literature followed for more than a century after his time. The imitation of Greek comedy, tragedy, and epic poetry, which produced great results in the hands of Nævius, Plautus, Ennius, and their successors, received its first impulse from him. To judge, however, by the very insignificant remains of his writings, and by the testimonies of Cicero and Horace to his merits, he can have had no pretension either to original genius or to artistic accomplishment. His real claim to distinction was that he was the first great schoolmaster of the Roman people, and the first acknowledged medium through which the genius of Greece acted on the Roman mind, and found for itself a rude expression in the Latin language. His name, in which the Greek *Andronicus* is combined with the gentile name of one of the great Roman houses, while indicative of his own position as a manumitted slave, is also significant of the influences by which Roman literature was fostered,—viz., the culture of men who were either Greeks or "semi-Græci" by birth and education, and the protection and favor afforded to them by the more enlightened members of the Roman aristocracy. He is supposed to have been a native of Tarentum, and to have been brought while still a boy, after the capture of that town in 272 B. C., as a slave to Rome. He lived in the household of a member of the *gens Livia*, probably of that branch of it to which M. Livius Salinator, the colleague of C. Claudius Nero in the year of the battle of the Metaurus, belonged. We learn from Suetonius that, like Ennius after him, he obtained his living by teaching Greek and Latin; and it was probably as a schoolbook, rather than as a work of literary pretension, that his translation of the *Odyssey* into Latin Saturnian verse was executed. This work was still used in schools when Horace was taught at Rome by the famous grammarian and disciplinarian Orbilius. From the few fragments of the translation that have been preserved it may be inferred that it was owing to the conservatism of educational methods, rather than to its fitness to impart to boys in the Ciceronian age instruction either in Greek literature or in the Latin language, that it enjoyed this distinction. But at the time when it appeared it must have satisfied a real want. In the wars with Pyrrhus and Tarentum the Romans had for the first time come into close contact with the Greeks; and during the First Punic War (from 261 to 241 B. C.), in which Sicily was the chief battleground of the combatants, this contact was much closer. The knowledge of Greek became essential to men in high position, as a means of intercourse with Greeks; and at the same time the new ideas and new interests of Greek literature began to exercise something of that stimulating and refining power over the minds of the leading men which it exercised in a later generation over Scipio Africanus, T. Quintius Flamininus, M. Fulvius Nobilior, and others like them. But the presence of the Roman armies in southern Italy and Sicily must have accustomed many who had no means of obtaining a literary education to the representations of the Greek tragic and comic poets. Although the great creative age of the Athenian drama was passed, the passion for the representation of the old plays still continued, and was not confined to Athens. The number of theatres of which the remains are still seen in Sicily—as at Segesta, Syracuse, Catania, Taormina—indicate that, in the island in which Epicharmus had produced his old Dorian comedies, the representation of tragedy and comedy continued to be a most important element in the life of the people. But the Romans and Italians had an indigenous drama of their own, known by the name of *Satura*, which prepared them for the reception of the more regular Greek drama. The distinction between this *Satura* and the plays of Euripides or Menander was that it had no regular plot. This the Latin drama first received from Livius Andronicus; but it did so at the cost of its originality. In the year 240, the year after the end of the First Punic War, he produced at Rome a translation of a Greek play (it is uncertain whether a comedy or tragedy), and this representation marks the beginning of Roman literature. In this translation he discarded the native Saturnian metre, and adopted the iambic, trochaic, and cretic metres, to which Latin more easily adapted itself than either to the hexameter or to the lyrical measures of a later time. He continued to produce plays for more than thirty years after this time. The titles of some of his tragedies are *Achilles*, *Ægisthus*, *Equus Trojanus*, *Hermione*, *Tereus*,—all suggestive of subjects which were treated by the later tragic poets of Rome. The titles of some of his comedies are *Gladiolus*, *Ludius*, etc. In the year 207, when, if he was a captive after the taking of Tarentum, he must have been of a great age, he was appointed to compose the hymn of thanksgiving for the victory of the Metaurus. Another tribute of national recognition paid him was that, as a compliment to him, the "college" or "guild" of poets obtained a place of meeting in the temple of Minerva on the Aventine.

A good account of his remains is to be found in Wordsworth's *Fragments and Specimens of Early Latin*. The fragments of his dramas are to be found in Ribbeck's *Tragicorum Latinorum Reliquiæ*, and *Comicorum Latinorum Reliquiæ*. (W. Y. S.)

LIVNY, a district town of Russia, in the government of Orel, 87 miles east-south-east of the chief town of the government, at the confluence of the rivers Livenka and Sosna. It has railway connection with the line between Orel and Gryazi. The town is an important centre for trade in grain, hemp, tallow, skins, and cattle. A large amount of grain is purchased in the neighboring governments, and the flour is sent to Moscow and the neighboring towns, as well as to the Baltic ports. Hemp is sent to St. Petersburg, and cattle to Moscow, or they are killed for the preparation of tallow. The 21,000 inhabitants of Livny find employment in trade and in the flour-mills, and hemp, tallow-candle, and oil works. The district of Livny is one of the most fertile and populous of central Russia, and is remarkable for its numerous large villages.

Livny was founded in 1586, at the junction of the three highways to Astrakhan, to Little Russia, and to the Crimea, along which the Tartars usually made their inroads on Russian provinces. It was several times destroyed by Tartars during the 16th and 17th centuries. In the great internal wars of the first half of the 16th century, Livny was a centre where all kinds of discontented persons and marauders met. Its fort, or kreml, with thick earthen and wooden walls, existed until 1784.

LIVONIA, or LIVLAND (*Liflandia* of the Russians), one of the three Baltic provinces of Russia, is bounded by the Gulf of Riga on the W., Esthonia on the N., the governments of St. Petersburg, Pskov, and Vitebsk on the E., and Courland on the S. A group of islands situated at the entrance of the Gulf of Riga, of which Ösel, Mohn, Runo, and Paternoster are the largest, belong to this government. It covers, with the islands, a surface of 17,574 square miles, but of this the part of Lake Peipus, or Tchudskoye, which belongs to it occupies 1090. Its surface is diversified by several plateaus, those of Haanhoyff and of the Livonian Aa having an average height of 700 feet, whilst several summits reach from 800 to 1000 feet or more (such as the Munna-Mäggi, 1063 feet; Haisingkalns, 1028 feet; Vella-Mäggi, 946 feet; Teufelsberg, 847 feet). The edges of the plateaus are intersected by deep valleys, which give a hilly character to the country; the hilly tract between the Duna and its tributary the Livonian Aa has received from its picturesque narrow valleys, covered with deep forests and numerous lakes, the name of "Wendish Switzerland." The plateau of Odenpä, watered by the tributaries of the Embach river, which flows for 93 miles from lake Wierz-yärvi into Lake Peipus, occupies an area of 2830 square miles, and has an average height of 500 feet. More than a thousand lakes are scattered over Livonia, of which that of Wierz-yärvi, having a surface of 105 square miles (114 feet above sea-level), is the largest; marshes and peat-bogs occupy as much as one-tenth of the province. Of the very numerous rivers which water Livonia, only the Duna, which flows for 90 miles along its frontier, and the Embach are navigable.

The geological structure of Livonia has been elaborately examined. The Silurian formation which covers Esthonia, and much resembles the Norwegian Silurian, appears in the northern part of Livonia, the remainder of the province consisting of Devonian strata. The whole is covered with a mighty sheet of glacial deposits, sometimes 400 feet thick. The typical bottom moraine, with boulders of all sizes up to 20 feet in diameter, brought from Finland, extends all over the country, reaching even to the summit of Munna-Mäggi. Glacial furrows, striæ, and elongated troughs are met with everywhere, running mostly from north-west to south-east, as well as *åsar*, which have the same direction and consist of morainic nucleus covered with stratified sands and clays; sand-downs cover large tracts on the shores of the Baltic. As in Esthonia, no traces of marine deposits are found higher than 100 or 150 feet above the present sea-level. The soil is not very fertile. Forests cover about two-fifths of the surface of this government, several of them having a diameter of 150 to 250 miles. The climate is rather severe. The mean temperatures are 43° Fahr. at Riga (winter 23°; summer, 63°), and 42½° at Dorpat. The intensity and direction of winds are very variable; the average number of rainy and snowy days is one hundred and forty-six at Riga (rainfall 24·1 inches); fogs are not uncommon.

The population of Livonia, which was but 621,600 in 1816, reached 1,000,876 in 1870, and is now about 1,411,000 in 1906. Though it is often described as a German province, only about 7 per cent. of the population (64,120 in 1863) are Germans, the great bulk being Ehsts or Esthonians (47 per cent.) and Letts (41·6 per cent.). The Russians number about 35,000, Poles 5000, and Jews 7000. The Livonians, who have given their name to the country, and who formerly extended far east to Sebej in the government of Vitebsk, have nearly all passed away; only a few thousands (2050 in 1863) inhabit the forests at the utmost extremity of the Peninsula of Courland. Their native language, of Finnish origin, is rapidly disappearing, their present language being rather a Lettish patois. Sjögren, in 1846, had much difficulty in making a grammar and dictionary of it from the mouths of old people. The Ehsts, who greatly resemble the Finns of Tavastland, have maintained their ethnic features, their customs, national traditions, national songs and poetry, and their harmonious language. There is now a marked revival of national feeling, favored by "Young Esthonia," together with a tendency towards a union with Finland. No less than eight political papers are published in the Esthonian language. The prevailing religion is the Lutheran (746,654 in 1863); about 80,000 Ehsts in Livonia and Esthonia, and 50,000 Letts (see LITHUANIANS), as well as the Russians, belong to the Greek Church (156,874 in 1863); of the Russians, however, a considerable proportion are *raskolniks* (nonconformists), who have emigrated to the Baltic provinces in consequence of prosecutions; these last number about 14,500, of whom 8000 are found in the neighborhood of Riga. About 6000 are Catholics. The Germans belong to the nobility, or to the burgher class in the towns.

The efforts of the German conquerors to Germanize the country have completely failed. The Ehsts and Letts openly display their traditional hatred against the invaders. The teaching in primary schools is carried on in Esthonian and Lettish; German prevails in colleges and higher schools. The Russian Government has for some time been laboring for "Russification;" the Russian civil code was introduced in the Baltic provinces in 1835, and the use of Russian, instead of German, in official correspondence and in law courts was ordered in 1867, but not generally brought into practice; the fact that the privileges given by the military law to those who have received primary education extend only to those who know Russian contributes to the extension of that language.

Nearly all the soil belongs to the nobility, the extent of peasants' estates being only 15 per cent. Serfdom was abolished in 1819, when the peasants received personal liberty, remaining, however, under the jurisdiction of their landlords, who maintained also the right to have a predominant influence in the nomination of ministers. Since 1849 the contribution in forced labor which the peasants were compelled to pay to landlords has been gradually, though imperfectly, commuted to a money payment, and the peasants have received the right to purchase their allotments. But, owing to later limitations of this law, as well as to the high price of allotments and to the establishment of a minimum size of 80 acres, the redemption of the land is going on very slowly. The class of peasant proprietors being restricted to a small number of wealthy peasants, the great bulk have remained *Knechts*, that is, tenants at will; they are very miserable, and about one-fourth of them are continually wandering in search of work. They readily emigrate, even to such unfertile provinces as Novgorod and Vitebsk, and from time to time the emigration takes the shape of a mass movement, which the Government stops by forcible measures. The average size of landed estates is from 9500 to 11,000 acres, far above the general average for Russia. The estates of the nobility are generally as well cultivated as in western Europe, while the peasants' farms are mostly in a deplorable state. In 1877 21·4 per cent. of the surface of Livonia was under crop, yielding 1,942,600 quarters of grain, and 1,843,200 quarters of potatoes. There were at the same time 146,000 horses, 372,000 cattle, 312,000 sheep, and 150,000 pigs. The shores of the Baltic yield valuable fisheries. Manufactures are steadily increasing. The distilleries yield about 1,400,000 gallons of spirits, part of which is exported; the beer breweries (two hundred) produce beer worth about 650,000 roubles. There are woollen, cotton, and silk mills, saw-mills, and paper, glass, candle, tobacco, and machinery works,—the chief manufacturing districts being Pernau and Riga. Livonia carries on a large export trade, especially through Riga and Pernau, in flax, linseed, hemp, grain, timber, and wooden wares; the Duna is of course the chief channel for this trade. During the last ten years, however, Libau has entered into brisk competition with the more northern ports of Livonia. The imports, especially through Riga, are also most important, the custom-houses of Livonia having had in 1881 an income of 6,000,000 silver roubles. The government is divided into eleven districts—Riga (104,200), Wollmar (2050), Dorpat (22,600), Pernau (12,500), Wenden (65,000), Arensburg in the island Ösel (3150), Walk (2950), Fellin (2900), Werro (2050), Lämsall (1450), and Schlock (800). The capital of the government is Riga.

The first historical notices of Livonia are by Tacitus and Jordanes, but coins of the time of Alexander the Great, found on the island of Ösel, show that the coasts of the

Baltic were at an early time in commercial relations with the civilized world. The chronicle of Nestor mentions as inhabitants of the Baltic coast the Tchud, the Lives, the Narova, Letgola, Semigalians, and Kors. It is probably about the 9th century that the Tchud became tributary to the Varyago-Russian states. As they reacquired their independence, Yaroslaff I. undertook in 1030 a campaign against them, and founded Yourieff (Dorpat). The first Germans penetrated into Livonia in the 11th century, and in 1158 several Bremen merchants landed at the mouth of the Duna. In 1186 the emissaries of the archbishop of Bremen began to preach the Christian religion among the Ehsts and Letts, and in 1200 the archbishop of Livonia established his residence at the mouth of the Duna, at Riga. In 1202 or 1204 Innocent III. recognized the Order of Brothers of the Sword (*Schwert-brüder*), the residence of its grandmaster being at Wenden; and the order, spreading the Christian religion by sword and fire among the natives, carried on from that time a series of uninterrupted wars against the Russian republics and Lithuania, as well as a struggle against the influence of the archbishop of Riga, which last was supported by the importance acquired by Riga as a centre for trade, intermediate between the Hanseatic towns and those of Novgorod, Pskov, and Polotsk. The first active interference of Lithuania in the affairs of Livonia dates from the times which immediately followed the great outbreak of peasants on Ösel; Olgerd devastated then all southern Livonia. The order happening to purchase the Danish part of Esthonia, in 1347, began with fresh forces the war against the bishop of Riga, as well as against Lithuania, Poland, and Russia. The wars against those powers were terminated respectively in 1435, 1466, and 1483. About the end of the 15th century the master of the order, Plettenberg, acquired a position of great importance, and in 1527 he was recognized as a prince of the empire by Charles V. On the other hand, the authority of the bishops of Riga was soon completely destroyed (1566). The war of the order with John IV. in 1550 led to a division of Livonia,—its northern part, Dorpat included, being taken by Russia, and the southern part falling under the dominion of Poland. From that time Livonia formed a subject of dispute between Poland and Russia, the latter only formally abdicating its rights to the country in 1582. In 1621 it was the theatre of a war between Poland and Sweden, and was conquered by the latter power, enjoying thus for twenty-five years a milder rule. In 1654, and again at the beginning of the 17th century, it became the theatre of war between Poland, Russia, and Sweden, and at last was finally conquered by Russia. The official concession was confirmed by the treaty of Nystad in 1721, Russia guaranteeing the privileges of the nobility and citizens, and the freedom of the evangelical confession.

(P. A. K.)

LIVY, the Roman historian, belonged by birth to those regions of northern Italy which had already given to Roman literature Catullus, Cornelius Nepos, and Virgil. He was born in 59 B. C., the year of Cæsar's first consulship, and was thus eleven years younger than Virgil and six years younger than Horace. His native city Padua (Patavium) could challenge comparison, in the days of Augustus, even with such great centres of industry as Alexandria or Gades; and, while its active municipal life, and long traditions of hard won independence, may have quickened Livy's sympathies with republican freedom, its ancient connection with Rome naturally helped to turn his attention to the study which became the work of his life. For Padua claimed, like Rome, a Trojan origin, and Livy is careful to place Antenor, the founder of Padua, side by side with Æneas. A more real bond of union was found in the dangers to which both had been exposed from the assaults of the Celts (Livy, x. 2), and Padua must have been drawn to Rome, as the conqueror of her hereditary foes, by much the same motives as those which led the Greeks in southern Italy to seek Roman aid against the Oscan invader. Moreover, at the time of Livy's birth, Padua had long been in possession of the full Roman franchise, and it is possible that the historian's family name had been taken by one of his ancestors out of compliment to the great Livian gens at Rome, whose connection with Cisalpine Gaul is a well-established fact (Livy, xxvii. 35; Suet., *Tib.*, 3), and by one of whom his family may have been enfranchised.

Livy's easy, independent life at Rome, and his aristocratic leanings in politics, have been taken as proof that he was the son of well-born and opulent parents; and it is certain that he was able to afford the luxury of a good education, for he was widely read in Greek literature, and a student both of rhetoric and philosophy. We have also evidence in his writings that he had prepared himself for his great work by researches into the history of his native town. His youth and early manhood, spent perhaps chiefly at Padua, were cast in stormy times, and the impression which they left upon his mind was ineffaceable. He was ten years old when Cæsar crossed the Rubicon and civil war began. In his fifteenth year came the murder of the great dictator, of whom he afterwards declared that he knew not "whether it were better for him to have been born or not," and one year later the murder of Cicero, to whose memory he paid an eloquent tribute. Of the part taken by Padua in the troubles which distracted the empire from 49 B. C. till the decisive victory at Actium we know nothing beyond the fact that in 43 B. C. it closed its gates against Antony, and was afterwards punished for doing so by Asinius Pollio. Livy's personal sympathies were with Pompey and the republican party (Tac., *Ann.*, iv. 34); but far more lasting in its effects was his experience of the license, anarchy, and confusion of these dark days. The rule of Augustus he seems to have accepted as a necessity, but he cannot, like Horace and Virgil, welcome it as inaugurating a new and glorious era. While he endeavors to stifle his recollections of the horrors he had witnessed, by fixing his whole mind on older and better times, he writes of the present with despondency as a degenerate and declining age; and, instead of triumphant prophecies of world-wide rule, such as we find in Horace, Livy contents himself with pointing out the dangers which already threatened Rome, and exhorting his contemporaries to learn, in good time, the lessons which the past history of the state had to teach.

It was probably about the time of the battle of Actium that Livy established himself in Rome, and there he seems chiefly to have resided until his retirement to Padua shortly before his death. We have no evidence that he travelled much, though he must have paid at least one visit to Campania (xxxviii. 56), and he never, so far as we know, took any part in political life. Nor, though he enjoyed the personal friendship and patronage of Augustus (Tac., *Ann.*, iv. 34), and stimulated the historical zeal of the future emperor Claudius (Suet., *Claud.*, xli.), can we detect in him anything of the courtier. There is not in his history a trace of that rather gross adulation in which even Virgil does not disdain to indulge. His republican sympathies were freely expressed, and, it should be added, as freely pardoned by Augustus. We must imagine him devoted to the great task which he had set himself to perform, with a mind, as he tells us himself in his preface, free from all disturbing cares, and in the enjoyment of all the facilities for study afforded by the Rome of Augustus, with its liberal encouragement of letters, its newly-founded libraries, and its brilliant literary circles. As his work went on, the fame which he had never coveted came to him in ample measure. He is said to have declared in one volume of his history that he had already won glory enough, and the younger Pliny (*Epist.*, ii. 3) relates that a Spaniard came all the way from Gades merely to see him, and, this accomplished, at once returned home satisfied. The accession of Tiberius (14 A. D.) materially altered for the worse the prospects of literature in Rome, and Livy may have feared for himself the fate which afterwards befell Cremutius Cordus, who was tried before the senate, for having in his annals spoken of Brutus and Cassius as the last of the Romans (Tac., *Ann.*, iv. 34). However this may have been, Livy retired to Padua, and died there in the third year of the reign of Tiberius (17 A. D.), at the ripe age of seventy-six. When we have added that he had at least one son (Quintil., x. 1), who was possibly also an author (Pliny, *Nat. Hist.*, i. 5, 6), and a daughter married to a certain L. Magius, a rhetorician of no great

merit (Seneca, *Controv.*, x. 29, 2), we have reached the end of all that is known with certainty of Livy's personal history; and the apocryphal nature of the details which have been added by later admirers has been too often exposed to make it necessary to deal with them here.[1]

But for us, as for Livy himself, the interest of his life centres in the work to which the greater part of it was devoted. For we must decline to believe with Niebuhr that his history was all written in his later years. On the contrary, various indications point to the period from 27 to 20 B. C., as that during which the first decade was written. In the first book (i. 19) the emperor is called Augustus, a title which he assumed early in 27 B. C., and in ix. 18 the omission of all reference to the restoration, in 20 B. C., of the standards taken at Carrhæ seems to justify the inference that the passage was written before that date. In the third decade, the allusion in xxviii. 12 to victories in Spain may, as Weissenborn thinks, refer to Agrippa's campaigns in 19 B. C., but the words "*ductu* auspicioque Augusti Cæsaris" point more naturally to those of Augustus himself, 27–25 B. C. In the epitome of book lix. there is a reference to a law of Augustus which was passed in 18 B. C. The books dealing with the civil wars must have been written during Augustus's lifetime, as they were read by him (Tac., *Ann.*, iv. 34), while there is some evidence that the last part of the work, from book cxxi. onwards, was published after his death (14 A. D.).

Livy's history begins with the landing of Æneas in Italy, and closes with the death of Drusus, 9 B. C., though it is possible that he intended to continue it as far as the death of Augustus. The original title of the work is unknown, but of its general plan it is possible to speak with more certainty. The division into decades is certainly not due to the author himself, and is first heard of at the end of the 5th century; on the other hand, the division into "libri" or "volumina" seems to be original. It is referred to by Livy himself (x. 31, "per quartum jam volumen;" xxxi. 1, "multa volumina"), as well as by Pliny (*N. H.*, *præf.*) and by later writers. That the books were grouped and possibly published in sets is rendered probable both by the prefaces which introduce new divisions of the work (vi. 1, xxi. 1, xxxi. 1) and by the description in one MS. of books cix.–cxvi. as "bellorum civilium libri octo." Such arrangement and publication in parts were moreover common with ancient authors, and in the case of a lengthy work almost a necessity.

Of the 142 "libri" composing the history, the first 15 carry us down to the eve of the great struggle with Carthage, a period, as Livy reckons it, of 488 years (xxxi. 1); 15 more (xvi.–xxx.) cover the 63 years of the two great Punic wars. With the close of book xlv. we reach the conquest of Macedonia in 167 B. C. Book lviii. described the tribunate of Tiberius Gracchus, 133 B. C. In book lxxxix. we have the dictatorship of Sulla (81 B. C.), in ciii. Cæsar's first consulship (59 B. C.), in cix.–cxvi. the civil wars to the death of Cæsar (44 B. C.), in cxxiv. the defeat of Brutus and Cassius at Philippi, in cxxxiii. and cxxxiv. the battle of Actium and the accession of Augustus. The remaining eight books give the history of the first twenty years of Augustus's reign.

Such in outline was the vast work of which Martial (xiv. 190) complains that his whole library could not contain it. But a small portion of it, however, has come down to modern times; only thirty-five books are now extant (i.–x., xx.–xlv.), and of these xli. and xliii. are incomplete. The lost books seem to have disappeared between the 7th century and the revival of letters in the 15th,—a fact sufficiently accounted for by the difficulty of transmitting so voluminous a work in times when printing was unknown, for the story that Pope Gregory I. burnt all the copies of Livy he could lay his hands on rests on no good evidence. Only one important fragment has since been recovered,—the portion of book xc. discovered in the Vatican in 1772, and edited by Niebuhr in 1820. Very much no doubt of the substance of the lost books has been preserved both by such writers as Plutarch and Dion Cassius, and by epitomizers like Florus and Eutropius. But our knowledge of their contents is chiefly derived from the so-called "periochæ" or epitomes, of which we have fortunately a nearly complete series, the epitomes of books cxxxvi. and cxxxvii. being the only ones missing. These epitomes have been ascribed without sufficient reason to Florus (2d century); but, though they are probably of even later date, and are disappointingly meagre, they may be taken as giving, so far as they go, a fairly authentic description of the original. They have been expanded with great ingenuity and learning by Freinsheim in Drakenborch's edition of Livy.[2]

The received text of the extant thirty-five books of Livy is taken from different sources, and no one of our MSS. contains them all. The MSS. of the first decade, some thirty in number, are with one exception derived, more or less directly, from a single archetype, viz., the recension made in the 4th century by the two Nicomachi, Flavianus and Dexter (not by one only, as Niebuhr thought), and by Victorianus. This is proved in the case of the older MSS. by written subscriptions to that effect, and in the case of the rest by internal evidence. Of all these descendants of the Nicomachean recension, the oldest is the Codex Parisinus of the 10th century, and the best the Codex Mediceus or Florentinus of the 11th. An independent value attaches to the ancient palimpsest of Verona, of which the first complete account was given by Mommsen as recently as 1868 (*Berliner Monatsber.*, January). It contains the third, fourth, fifth, and fragments of the sixth book, and, according to Mommsen, whose conclusions are accepted by Madvig (*Emend. Livianæ*, 2d ed., 1877, p. 37), it is derived, not from the Nicomachean recension, but from an older archetype common to both.

For the third decade our chief authority is the Codex Puteanus, an uncial MS. of the 8th century, now at Paris. For the fourth we have two leading MSS.,—Codex Bambergensis, 11th century, and the slightly older Codex Moguntinus, which is only known through the Mainz edition of 1518–19. What remains of the fifth decade depends on the Laurishamensis or Vindobonensis from the monastery of Lörsch, edited at Basel in 1531. It belongs to the 6th century.

If we are to form a correct judgment on the merits of Livy's history, we must, above all things, bear in mind what his aim was in writing it, and this he has told us himself in the celebrated preface which Niebuhr rather unaccountably denounces as "the worst part of his work" (*Introd. Lect.*, p. 60). He set himself the task of recording the history of the Roman people, "the first in the world," from the beginning. The task was a great one, and the fame to be won by it uncertain, yet it would be something to have made the attempt, and the labor itself would bring a welcome relief from the contemplation of present evils; for his readers too this record will, he says, be full of instruction: they are invited to note especially the moral lessons taught by the story of Rome, to observe how Rome rose to greatness by the simple virtues and unselfish devotion of her citizens, and how on the decay of these qualities followed degeneracy and decline.

He does not therefore write, as Polybius wrote, for students of history. With Polybius the greatness of Rome is a phenomenon to be critically studied and scientifically explained; the rise of Rome forms an important chapter in universal history, and must be dealt with, not as an isolated fact, but in connection with the general march of events in the civilized world. Still less has Livy anything in common with the naive anxiety of Dionysius to make it clear to his fellow Greeks that the irresistible people who had mastered them was in origin, in race, and in language Hellenic like themselves.

Livy writes as a Roman, to raise a monument worthy

[1] For Livy's life see the introduction to Weissenborn's edition, Berlin, 1871, and the article in Smith's *Dictionary of Biography*.

[2] The various rumors once current of complete copies of Livy in Constantinople, Chios, and elsewhere are noticed by Niebuhr, *Introd. Lect.*, p. 67, Eng. transl. See also Pauly, *Real-Encyclopädie*, *s. v.*

of the greatness of Rome, and to keep alive, for the guidance and the warning of Romans, the recollection alike of the virtues which had made Rome great and of the vices which had threatened her with destruction. In so writing he was in close agreement with the traditions of Roman literature, as well as with the conception of the nature and objects of history current in his time. To a large extent Roman literature grew out of pride in Rome, for, though her earliest authors took the form and often the language of their writings from Greece, it was the greatness of Rome that inspired the best of them, and it was from the annals of Rome that their themes were taken. And this is naturally true in an especial sense of the Roman historians; the long list of annalists begins at the moment when the great struggle with Carthage had for the first time brought Rome into direct connection with the historic peoples of the ancient world, and when Romans themselves awoke to the importance of the part reserved for Rome to play in universal history. To write the annals of Rome became at once a task worthy of the best of her citizens. Though other forms of literature might be thought unbecoming to the dignity of a free-born citizen, this was never so with history. On the contrary, men of high rank and tried statesmanship were on that very account thought all the fitter to write the chronicles of the state they had served. And history in Rome never lost either its social prestige or its intimate and exclusive connection with the fortunes of the Roman people. It was well enough for Greeks to busy themselves with the manners, institutions, and deeds of the "peoples outside." The Roman historians, from Fabius Pictor to Tacitus, cared for none of these things. This exclusive interest in Rome was doubtless encouraged by the peculiar characteristics of the history of the state. The Roman annalist had not, like the Greek, to deal with the varying fortunes and separate doings of a number of petty communities, but with the continuous life of a single city. Nor was his attention drawn from the main lines of political history by the claims of art, literature, and philosophy, for just as the tie which bound Romans together was that of citizenship, not of race or culture, so the history of Rome is that of the state, of its political constitution, its wars and conquests, its military and administrative system.

Livy's own circumstances were all such as to render these views natural to him. He began to write at a time when, after a century of disturbance, the mass of men had been contented to purchase peace at the price of liberty. The present was at least inglorious, the future doubtful, and many turned gladly to the past for consolation. This retrospective tendency was favorably regarded by the Government. It was the policy of Augustus to obliterate all traces of recent revolution, and to connect the new imperial regime as closely as possible with the ancient traditions and institutions of Rome and Italy. The *Æneid* of Virgil, the *Fasti* of Ovid, suited well with his own restoration of the ancient temples, his revival of such ancient ceremonies as the Ludi Sæculares, his efforts to check the un-Roman luxury of the day, and his jealous regard for the purity of the Roman stock. And, though we are nowhere told that Livy undertook his history at the emperor's suggestion, it is certain that Augustus read parts of it with pleasure, and even honored the writer with his assistance and friendship.

Livy was deeply penetrated with a sense of the greatness of Rome. From first to last its majesty and high destiny are present to his mind. Æneas is led to Italy by the fates that he may be the founder of Rome (i. 1; comp. i. 4, "debebatur fatis tantæ origo urbis"). Romulus after his ascension declares it to be the will of heaven that Rome should be mistress of the world; and Hannibal marches into Italy, that he may "set free the world" from Roman rule. But if this ever-present consciousness often gives dignity and elevation to his narrative, it is also responsible for some of its defects. It leads him occasionally into exaggerated language (*e. g.*, xxii. 33, "nullius usquam terrarum rei cura Romanos effugiebat") or into such misstatements as that in xxi. 99, where he explains the course taken by the Romans in renewing war with Carthage by saying that "it seemed more suitable to the dignity of the Roman people." Often his jealousy for the honor of Rome makes him unfair and one-sided. In all her wars not only success but justice is with Rome (*e. g.*, the war with Perseus of Macedon; see Cobet in *Mnemosyne* for 1881). When Hieronymus of Syracuse deserts Rome for Hannibal, Livy says nothing of the complaints against Rome, by which, according to Polybius, he justified his change of policy. To the same general attitude is also due the omission by Livy of all that has no direct bearing on the fortunes of the Roman people. "I have resolved," he says (xxxix. 48), "only to touch on foreign affairs so far as they are bound up with those of Rome." The operations of the Rhodians in Asia Minor (197 B. C., xxxiii. 20) he curtly dismisses in a sentence, that he may pass "ad ea quæ propria Romani belli sunt;" and so again (xli. 25) "it is not worth my while to recount in detail the wars of foreigners with each other; it is as much and more than I can do to record the doings of the Roman people." As the result, we get from Livy very defective accounts even of the Italic peoples most closely connected with Rome. Of the past history and the internal condition of the more distant nations she encountered he tells us little or nothing, even when he found such details carefully given by Polybius.

Scarcely less strong than his interest in Rome is his interest in the moral lessons which her history seemed to him so well qualified to teach. This didactic view of history was a prevalent one in antiquity, and it was confirmed no doubt by those rhetorical studies which in Rome as in Greece formed the chief part of education, and which taught men to look on history as little more than a store-house of illustrations and themes for declamation. But it suited also the practical bent of the Roman mind, with its comparative indifference to abstract speculation or purely scientific research. It is in the highest degree natural that Livy should have sought for the secret of the rise of Rome, not in any large historical causes, but in the moral qualities of the people themselves, and that he should have looked upon the contemplation of these as the best remedy for the vices of his own degenerate days. It is possible too that the simplicity and even austerity of manners for which Padua was afterwards celebrated may have characterized its citizens in Livy's time, and that he was thus especially fitted to appreciate the purity, reverence, and loyalty of early Rome. But, whatever the cause, there is no doubt of the fact. He is never tired of insisting on the virtues of past days, or of contrasting them with the vices of the present. He dwells with delight on the unselfish patriotism of the old heroes of the republic. In those times children obeyed their parents, the gods were still sincerely worshipped, poverty was no disgrace, sceptical philosophies and foreign fashions in religion and in daily life were unknown. But this ethical interest is closely bound up with his Roman sympathies. His moral idea is no abstract one, and the virtues he praises are those which in his view made up the truly Roman type of character. "Minime Romani ingenii homo" is the sentence of condemnation he passes (xxii. 58) on a Roman soldier who broke faith with Hannibal. Camillus is praised as "vir ac vere Romanus" (xxii. 14); "to do and to suffer bravely" is Roman (ii. 12). The prominence thus given to the moral aspects of the history tends to obscure in some degree the true relations and real importance of the events narrated, but it does so in Livy to a far less extent than in some other writers. He is much too skilful an artist either to resolve his history into a mere bundle of examples, or to overload it, as Tacitus is sometimes inclined to do, with reflections and axioms. The moral he wishes to enforce is usually either conveyed by the story itself, with the aid per-

haps of a single sentence of comment, or put as a speech into the mouth of one of his characters (*e. g.*, xxiii. 49; the devotion of Decius, viii. 10, comp. vii. 40; and the speech of Camillus, v. 54); and what little his narrative thus loses in accuracy it gains in dignity and warmth of feeling. In his portraits of the typical Romans of the old style, such as Q. Fabius Maximus, in his descriptions of the unshaken firmness and calm courage shown by the fathers of the state in the hour of trial, Livy is at his best; and he is so largely in virtue of his genuine appreciation of character as a powerful force in the affairs of men.

This enthusiasm for Rome and for Roman virtues is, moreover, saved from degenerating into gross partiality by the genuine candor of Livy's mind and by his wide sympathies with everything great and good. Seneca has described him as "candidissimus omnium magnorum ingeniorum æstimator" (*Suasor.*, vi. 21). Quintilian (x. 1, 101) places him on a level with Herodotus as a writer "clarissimi candoris," and this candid admiration is not reserved exclusively for Romans. Hasdrubal's devotion and valor at the battle on the Metaurus are described in terms of eloquent praise (xxvii. 49, "there, as became the son of Hamilcar and the brother of Hannibal, he fell fighting"); and even in Hannibal, the lifelong enemy of Rome, he frankly recognizes the great qualities that balanced his faults. Nor though his sympathies are unmistakably with the aristocratic party, does he scruple to censure the pride, cruelty, and selfishness which too often marked their conduct (ii. 54; the speech of Canuleius, iv. 3; of Sextius and Licinius, vi. 36); and, though he feels acutely that the times are out of joint, and has apparently little hope of the future, he still believes in justice and goodness. He is often righteously indignant, but never satirical, and such a pessimism as that of Tacitus and Juvenal is wholly foreign to his nature.

Though he studied and even wrote on philosophy (Senec., *Ep.* 100), Livy is by no means a philosophic historian. We learn indeed from incidental notices that he inclined to Stoicism and disliked the Epicurean system. With the scepticism that despised the gods (x. 40) and denied that they meddled with the affairs of men (xliii. 13) he has no sympathy. The immortal gods are everywhere the same (xiii. 3); they govern the world (xxxvii. 45) and reveal the future to men by signs and wonders (xliii. 13), but only a debased superstition will look for their hand in every petty incident (xxvii. 23, "minimis etiam rebus prava religio inserit deos"), or abandon itself to an indiscriminate belief in the portents and miracles in which popular credulity delights (xxviii. 11, xxi. 62, "multa ea hieme prodigia . . . aut quod evenire solet, motis semel in religionem animis, multa nunciata et temere credita"). The ancient state religion of Rome, with its temples, priests, and auguries, he not only reverences as an integral part of the Roman constitution, with a sympathy which grows as he studies it (xliii. 13, "et mihi vetustas res scribenti, nescio quo pacto antiquus fit animus"), but, like Varro, and in true Stoic fashion, he regards it as a valuable instrument of government (i. 19, 21), indispensable in a well-ordered community. As distinctly Stoical is the doctrine of a fate to which even the gods must yield (ix. 4), which disposes the plans of men (i. 42) and blinds their minds (v. 37), yet leaves their wills free (xxxvii. 45).

But we find no trace in Livy of any systematic application of philosophy to the facts of history. He is as innocent of the leading ideas which shaped the work of Polybius as he is of the cheap theorizing which wearies us in the pages of Dionysius. The events are graphically, if not always accurately, described; but of the larger causes at work in producing them, of their subtle action and reaction upon each other, and of the general conditions amid which the history worked itself out, he takes no thought at all. Nor has Livy much acquaintance with either the theory or the practice of politics. He exhibits, it is true, political sympathies and antipathies. He is on the whole for the nobles and against the commons; and, though the unfavorable colors in which he paints the leaders of the latter are possibly reflected from the authorities he followed, it is evident that he despised and disliked the multitude (xxiv. 25, "aut servit humiliter aut superbe dominatur"). Of monarchy he speaks with a genuine Roman hatred, and we know that in the last days of the republic his sympathies were wholly with those who strove in vain to save it. He betrays too an insight into the evils which were destined finally to undermine the imposing fabric of Roman empire. The decline of the free population, the spread of slavery (vi. 12, vii. 25), the universal craving for wealth (iii. 26), the employment of foreign mercenaries (xxv. 33), the corruption of Roman race and Roman manners by mixture with aliens (xxxix. 3), are all noticed in tones of solemn warning. But his retired life had given him no wide experience of men and things. It is not surprising, therefore, to find that he fails altogether to present a clear and coherent picture of the history and working of the Roman constitution, or that his handling of intricate questions of policy is weak and inadequate.

If from the general aim and spirit of Livy's history we pass to consider his method of workmanship, we are struck at once by the very different measure of success attained by him in the two great departments of an historian's labor. He is a consummate artist, but an unskilled and often careless investigator and critic. The materials which lay ready to his hand may be roughly classed under two heads:—(1) the original evidence of monuments, inscriptions, etc., (2) the written tradition as found in the works of previous authors. It is on the second of these two kinds of evidence that Livy almost exclusively relies. Yet that even for the very early times a certain amount of original evidence still existed is proved by the use which was made of it by Dionysius, who mentions at least three important inscriptions, two dating from the regal period and one from the first years of the republic (iv. 26, iv. 58, x. 32). We know from Livy himself that the breastplate dedicated by Cossus (428 B. C.) was to be seen in his own day in the temple of Jupiter Feretrius, nor is there any reason to suppose that the "libri lintei," quoted by Licinius Macer, were not extant when Livy wrote. For more recent times the materials were plentiful, and a rich field of research lay open to the student in the long series of laws, decrees of the senate, and official registers, reaching back, as it probably did, at least to the commencement of the 3d century B. C. Nevertheless it seems certain that Livy never realized the duty of consulting these relics of the past, even in order to verify the statements of his authorities. Many of them he never mentions; the others (*e. g.*, the libri lintei) he evidently describes at second hand. Antiquarian studies were popular in his day, but the instances are very few in which he has turned their results to account. There is no sign that he had ever read Varro; and he never alludes to Verrius Flaccus. The haziness and inaccuracy of his topography make it clear that he did not attempt to familiarize himself with the actual scenes of events even that took place in Italy. Not only does he confuse Thermon, the capital of Ætolia, with Thermopylæ (xxxiii. 35), but his accounts of the Roman campaigns against Volsci, Æqui, and Samnites swarm with confusions and difficulties; nor are even his descriptions of Hannibal's movements free from an occasional vagueness which betrays the absence of an exact knowledge of localities.

The consequence of this indifference to original research and patient verification might have been less serious had the written tradition on which Livy preferred to rely been more trustworthy. But neither the materials out of which it was composed nor the manner in which it had been put together were such as to make it a safe guide. It was indeed represented by a long line of respectable names. The majority of the Roman annalists were men of high birth and education, with a long experience of affairs, and their defects did not arise from seclusion of life or ignorance of

letters. It is rather in the conditions under which they wrote and in the rules and traditions of their craft that the causes of their shortcomings must be sought.

It was not until the 6th century from the foundation of the city that historical writing began in Rome. The father of Roman history, Q. Fabius Pictor, a patrician and a senator, can scarcely have published his annals before the close of the Second Punic War, but these annals covered the whole period from the arrival of Evander in Italy down at least to the battle by Lake Trasimene (217 B. C.). Out of what materials, then, did he put together his account of the earlier history? Recent criticism has succeeded in answering this question with some degree of certainty. A careful examination of the fragments of Fabius (see H. Peter, *Historicorum Romanorum Relliquiæ*, Leipsic, 1870; and Nitzsch, *Röm. Annalistik*, Berlin, 1873) reveals in the first place a marked difference between the kingly period and that which followed the establishment of the republic. The history of the former stretches back into the regions of pure mythology. It is little more than a collection of fables told with scarcely any attempt at criticism, and with no more regard to chronological sequence than was necessary to make the tale run smoothly or to fill up such gaps as that between the flight of Æneas from Troy and the supposed year of the foundation of Rome. But from its very commencement the history of the Republic wears a different aspect. The mass of floating tradition, which had come down from early days, with its tales of border raids and forays, of valiant chiefs, and deeds of patriotism, is now rudely fitted into a framework of a wholly different kind. This framework consists of short notices of important events, wars, prodigies, consecration of temples, etc., all recorded with extreme brevity, precisely dated, and couched in a somewhat archaic style. They were taken probably from one or more of the state registers, such as the annals of the pontiffs, or those kept by the ædiles in the temple of Ceres. This bare official outline of the past history of his city was by Fabius filled in from the rich store of tradition that lay ready to his hand. The manner and spirit in which he effected this combination were no doubt wholly uncritical. Usually he seems to have transferred both annalistic notices and popular traditions to his pages much in the shape in which he found them. But he unquestionably gave undue prominence to the tales of the prowess and glory of the Fabii, and probably also allowed his own strong aristocratic sympathies to color his version of the early political controversies. This fault of partiality was, according to Polybius, a conspicuous blot in Fabius's account of his own times, which was, we are told, full and in the main accurate, and, like the earlier portions, consisted of official annalistic notices, supplemented, however, not from tradition, but from his own experience and from contemporary sources. But even here Polybius charges him with favoring Rome at the expense of Carthage, and with the undue exaltation of the great head of his house, Q. Fabius Cunctator.

Nevertheless the comparative fidelity with which Fabius seems to have reproduced his materials might have made his annals the starting point of a critical history. But unfortunately intelligent criticism was exactly what they never received. It is true that in some respects a decided advance upon Fabius was made by subsequent annalists. M. Porcius Cato (234–149 B. C.) widened the scope of Roman history so as to include that of the chief Italian cities, and made the first serious attempt to settle the chronology. In his history of the Punic wars Cælius Antipater (*circa* 130 B. C.) added fresh material, drawn probably from the works of the Sicilian Greek Silenus, while Licinius Macer (70 B. C.) distinguished himself by the use he made of the ancient "linen books." No doubt, too, the later annalists, at any rate from Cælius Antipater onwards, improved upon Fabius in treatment and style. But in more essential points we can discern no progress. One annalist after another quietly adopted the established tradition, as it had been left by his predecessors, without any serious alterations of its main outlines. Of independent research and critical analysis we find no trace, and the general agreement upon main facts is to be attributed simply to the regularity with which each writer copied the one before him. But, had the later annalists contented themselves with simply reproducing the earlier ones, we should at least have had the old tradition before us in a simple and tolerably genuine form. As it was, while they slavishly clung to its substance, they succeeded as a rule in destroying all traces of its original form and coloring. L. Calpurnius Piso, tribune in 149 B. C. and consul in 133 B. C., prided himself on reducing the old legends to the level of common sense, and importing into them valuable moral lessons for his own generation. By Cælius Antipater the methods of rhetoric were first applied to history, a disastrous precedent enough. He inserted speeches, enlivened his pages with chance tales, and aimed, as Cicero tells us, at not merely narrating facts but also at beautifying them. His successors carried still further the practice of dressing up the rather bald chronicles of earlier writers with all the ornaments of rhetoric. The old traditions were altered, almost beyond the possibility of recognition, by exaggerations, interpolations, and additions. Fresh incidents were inserted, new motives suggested, and speeches composed in order to infuse the required life and freshness into these dry bones of history. At the same time the political bias of the writers, and the political ideas of their day were allowed, in some cases perhaps half unconsciously, to affect their representations of past events. Annalists of the Gracchan age imported into the early struggles of patricians and plebeians the economic controversies of their own day, and painted the first tribunes in the colors of the two Gracchi or of Saturninus. In the next generation they dexterously forced the venerable records of the early republic to pronounce in favor of the ascendency of the senate, as established by Sulla. To political bias was added family pride, for the gratification of which the archives of the great houses, the funeral panegyrics, or the imagination of the writer himself supplied an ample store of doubtful material. Pedigrees were invented, imaginary consulships and fictitious triumphs inserted, and family traditions and family honors were formally incorporated with the history of the state.

Things were not much better even where the annalists were dealing with recent or contemporary events. Here indeed their materials were naturally fuller and more trustworthy, and less room was left for fanciful decoration and capricious alteration of the facts. But their methods are in the main unchanged. What they found written they copied; the gaps they supplied, where personal experience failed, by imagination. No better proof of this can be given than a comparison of the annalist's version of history with that of Polybius. In the fourth and fifth decades of Livy the two appear side by side, and the contrast between them is striking. Polybius, for instance, gives the number of the slain at Cynoscephalæ as 8000; the annalists raise it as high as 40,000 (Livy, xxxiii. 10). In another case (xxxii. 6) Valerius Antias, the chief of sinners in this respect, inserts a decisive Roman victory over the Macedonians, in which 12,000 of the latter were slain and 2200 taken prisoners, an achievement recorded by no other authority. In some parts of these two decades, however, Livy gives us only the annalists' story. Of the campaigns in Cisalpine Gaul, Liguria, and Spain, as described by him on their authority, Nissen well remarks (*Untersuch.*, p. 94), "One would think that the Gauls, Ligurians, and Spaniards were there for the sole purpose of being slaughtered in thousands by the Romans. Year after year they rise in revolt against Rome, lose some 40,000 men in the struggle, and finally submit, only to begin the same game afresh next year."

Such was the written tradition on which Livy mainly relied. We have next to examine the manner in which he used it, and here we are met at the outset by the difficulty of determining with exactness what authorities he is following at any one time; for of the importance of full and accurate references he has no idea, and often for chapters together he gives us no clue at all. More often still he contents himself with such vague phrases as "they say," "the story goes," "some think," or speaks in general terms of "ancient writers" or "my authorities." Even where he mentions a writer by name, it is frequently clear that the writer named is not the one whose lead he is following at the moment, but that he is noticed incidentally as differing from Livy's guide for the time being on some point of detail (compare the references to Piso in the first decade, i. 55, ii. 32, etc.). It is very rarely that Livy explicitly tells us whom he has selected as his chief source (*e. g.*, Fabius, xxii. 7; Polybius, xxxiii. 10). By a careful analysis, however, of those portions of his work which admit of a comparison with the text of his acknowledged authorities (*e. g.*, fourth and fifth decades, see Nissen, *Untersuchungen*, Berlin, 1863), and elsewhere by comparing his version with the known fragments of the various annalists, and with what we are told of their style and method of treatment, we are able to form a general idea of his plan of procedure. As to the first decade, it is generally agreed that in the first and second books at any rate he follows such older and simpler writers as Fabius Pictor and Calpurnius Piso (the only ones whom he there refers to by name), to whom, so far as the first book is concerned, Niebuhr (*Introd. Lect.*, p. 33) would add the poet Ennius. With the close of the second book or the opening of the third we come upon the first traces of the use of later authors. Valerius Antias is first quoted in iii. 5, and signs of his handiwork are visible here and there

throughout the rest of the decade (vii. 36, ix. 27, x. 3–5). In the fourth book the principal authority is apparently Licinius Macer, and for the period following the sack of Rome by the Gauls Q. Claudius Quadrigarius, whose annals began at this point in the history. We have besides a single reference (vii. 3) to the antiquarian Cincius, and two (iv. 23, x. 9) to Q. Ælius Tubero, one of the last in the list of annalists. Passing to the third decade, we find ourselves at once confronted by a question which has been long and fully discussed—the relation between Livy and Polybius. Did Livy use Polybius at all, and, if so, to what extent? (See for details Hübner, *Grundriss zu Vorlesungen üb. d. Röm. Litteraturgeschichte*, p. 195.)

It is conceded on all hands that Livy in this decade makes considerable use of other authorities than Polybius (*e. g.*, Fabius, xxii. 7; Cælius Antipater, xxi. 38, 46, 47, xxii. 31, etc.), that he only once mentions Polybius (xxx. 45, "Polybius haudquaquam spernendus auctor"), and that, if he used him, he did so to a much less extent than in the fourth and fifth decades, and in a very different manner. It is also agreed that we can detect in Livy's account of the Hannibalic war two distinct elements, derived originally, the one from a Roman, the other from a non-Roman source. But from these generally accepted premisses two opposite conclusions have been drawn. On the one hand it is maintained (*e. g.*, by Lachmann, C. Peter, H. Peter, *Hist. Rom. Reliq.*) that those parts of Livy's narrative which point to a non-Roman authority (*e. g.*, Hannibal's movements prior to his invasion of Italy) are taken by Livy directly from Polybius, with occasional reference of course to other writers, and with the omission (as in the later decades) of all matters uninteresting to Livy or his Roman readers, and the addition of rhetorical touches and occasional comments. It is urged that Livy, who in the fourth and fifth decades shows himself so sensible of the great merits of Polybius, is not likely to have ignored him in the third, and that his more limited use of him in the latter case is fully accounted for by the closer connection of the history with Rome and Roman affairs, and the comparative excellence of the available Roman authorities, and, lastly, that the points of agreement with Polybius, not only in matter but in expression, can only be explained on the theory that Livy is directly following the great Greek historian. On the other hand it is maintained (especially by Schwegler, Nitzsch, and K. Böttcher) that the extent and nature of Livy's agreement with Polybius in this part of his work point rather to the use by both of a common original authority. It is argued that Livy's mode of using his authorities is tolerably uniform, and that his mode of using Polybius in particular is known with certainty from the later decades. Consequently the theory that he used Polybius in the third decade requires us to assume that in this one instance he departed widely, and without sufficient reason, from his usual course of procedure. Moreover, even in the passages where the agreement with Polybius is most apparent, there are so many discrepancies and divergencies in detail, and so many unaccountable omissions and additions, as to render it inconceivable that he had the text of Polybius before him. But all these are made intelligible if we suppose Livy to have been here following directly or indirectly the same original sources that were used by Polybius. The earliest of these original sources was probably Silenus, with whom may possibly be placed, for books xxi., xxii., Fabius Pictor. The latter Livy certainly used directly for some parts of the decade. The former he almost as certainly knew only at second hand, the intermediate authority being probably Cælius Antipater. This writer, who confined himself to a history of the Second Punic War, in seven books, is expressly referred to by Livy eleven times in the third decade; and in other passages where his name is not mentioned Livy can be shown to have followed him (*e. g.*, xxii. 5, 49, 50, 51; xxiv. 9). In the latter books of the decade his chief authority is possibly Valerius Antias.

In the fourth and fifth decades the question of Livy's authorities presents no great difficulties, and the conclusions arrived at by Nissen in his masterly *Untersuchungen* have met with general acceptance. These may be shortly stated as follows. In the portions of the history which deal with Greece and the East, Livy follows Polybius, and these portions are easily distinguishable from the rest by their superior clearness, accuracy, and fulness. On the other hand, for the history of Italy and western Europe he falls back on Roman annalists, especially, it seems, on Claudius Quadrigarius and Valerius Antias,—a most unfortunate choice,—and from them too he takes the annalistic mould into which his matter is cast.

Livy's general method of using these authorities was certainly not such as would be deemed satisfactory in a modern historian. He is indeed free from the grosser faults of deliberate injustice and falsification, and he resists that temptation to invent to which "the minds of authors are only too much inclined" (xxii. 7). Nor is he unconscious of the necessity for some kind of criticism. He distinguishes between rumor and the precise statements of recognized authorities (*cf.* xxi. 46, v. 21, vii. 6). The latter he reproduced in the main faithfully, but with a certain exercise of discretion. Where they disagreed, he calls attention to the fact, occasionally pronouncing in favor of one version rather than another (ii. 41, xxi. 46), though often on no adequate grounds, or attempting to reconcile and explain discrepancies (vi. 12, 38). Where he detects or suspects the insertion of fabulous matter he has no scruple in saying so (*e. g.*, ii. 7, v. 21, "inseritur huic loco fabula"). Gross exaggerations, such as those in which Valerius Antias indulged, he roundly denounces (xxxvi. 38, "in augendo numero non alius intemperantior"), and with equal plainness of speech he condemns the family vanity which has so constantly corrupted and distorted the truth. "I suppose," he says (viii. 40), "that the record and memorial of these matters hath been depraved and corrupted by these funeral orations of praises, ... while every house and family draweth to it the honor and renown of noble exploits, martial feats, and dignities by any untruth and lie, so it be colorable." The legendary character of the earliest traditions he frankly admits. "Such things as are reported either before or at the foundation of the city, more beautified and set out with poets' fables than grounded upon pure and faithful records, I mean neither to aver nor disprove" (*Præf.*); and of the whole history previous to the sack of Rome by the Gauls (390 B. C.) he writes that it was obscure "both in regard of exceeding antiquity, and also for that in those days there were very few writings and monuments, the only faithful safeguard and true remembrancers of deeds past; and, besides, whatsoever was registered in the commentaries of the priests and in other public or private records, the same for the most part, when the city was burned, perished withal." Further than this, however, Livy's criticism does not go. Where his written authorities are not palpably inconsistent with each other or with probability, he accepts and transcribes their record without any further inquiry, nor does he ever attempt to get behind this record in order to discover the original evidence on which it rested. His acceptance in any particular case of the version given by an annalist by no means implies that he has by careful inquiry satisfied himself of its truth. At the most it only pre-supposes a comparison with other versions, equally second hand, but either less generally accepted or less in harmony with his own views of the situation; and in many cases the reasons he gives for his preference of one account over another are eminently unscientific (*e. g.*, xxvi. 49, "media simillima veris"). Livy's history, then, rests on no foundation of original research or even of careful verification. It is a compilation, and even as such it leaves much to be desired. For we cannot credit Livy with having made such a preliminary survey of his authorities as would enable him to determine their relations to each other, and fuse their various narratives into a consistent whole. It is clear, on the contrary, that his circle of authorities for any one decade was a comparatively small one, that of these he selected one, and transcribed him with the necessary embellishments and other slight modifications until impelled by various reasons to drop him. He then, without warning, takes up another, whom he follows in the same way. The result is a curious mosaic, in which pieces of all colors and dates are found side by side, and in which even the great artistic skill displayed throughout fails to conceal the lack of internal unity. Thus many of Livy's inconsistencies are due to his having pieced together two versions, each of which gave a differently colored account of the same event. Mommsen has clearly shown that this is what has happened in his relation of the legal proceedings against the elder Africanus in book xxxviii. (*Röm. Forschungen*, ii.); and in the story of the first secession, as he tells it, the older version which represented it as due to political and the later which explained it by economical grievances are found side by side. Similarly a change from one authority to another leads him not unfrequently to copy from the latter statements inconsistent with those he took from the former, to forget what he has previously said, or to treat as known a fact which has not been mentioned before (*cf.* ii. 1, xxxiv. 6, and Weissenborn's *Introduction*, p. 37). In other cases where the same event has been placed by different annalists in different years, or where their versions of it varied, it reappears in Livy as two events. Thus the four campaigns against the Volsci (ii. 17, *sq.*) are, as Schwegler (*R. G.*, i. 13) rightly says, simply variations of one single expedition. Other instances of such "doublettes" are the two single combats described in xxiii.

46, and xxv. 18, and the two battles at Bæcula in Spain (xxvii. 17 and xxviii. 12). Without doubt too much of the chronological confusion observable throughout Livy is due to the fact that he follows now one now another authority, heedless of their differences on this head. Thus he vacillates between the Catonian and Varronian reckoning of the years of the city, and between the chronologies of Polybius and the Roman annalists.

To these defects in his method must be added the fact that he does not always succeed even in accurately reproducing the authority he is for the time following. In the the case of Polybius, for instance, he allows himself great freedom in omitting what strikes him as irrelevant, or tedious, or uninteresting to his Roman readers, a process in which much valuable matter disappears. In other cases his desire to give a vividness and point to what he doubtless considered the rather bald and dry style of Polybius leads him into absurdities and inaccuracies. Thus by the treaty with Antiochus (188 B. C.) it was provided that the Greek communities of Asia Minor "shall settle their mutual differences by arbitration," and so far Livy correctly transcribes Polybius, but he adds with a rhetorical flourish, "or, if both parties prefer it, by war" (xxxviii. 38). Elsewhere his blunders are apparently due to haste, or ignorance, or sheer carelessness; thus, for instance, when Polybius speaks of the Ætolians assembling at their capital Thermon, Livy (xxxiii. 35) not only substitutes Thermopylæ, but gratuitously informs his readers that here the Pylæan assemblies were held. Thanks partly to carelessness, partly to mistranslation, he makes sad havoc (xxxv. 5 *sq.*) of Polybius's account of the battle of Cynoscephalæ, while in xxxviii. 7 he mistakes θυρεούς ("shields") for θύρας ("doors"), and makes nonsense of the passage accordingly. Finally, Livy cannot be altogether acquitted on the charge of having here and there modified Polybius in the interests of Rome, as when he gives an air of magnanimous moderation to the spoliation of Ambracia (189 B. C.), by adding, after describing the carrying away of all statues, bronzes, and pictures, "nihil præterea tactum violatumve" (xxxviii. 9, comp. xlv. 19; and Nissen, *Unters.*, p. 31).

Serious as these defects in Livy's method appear if viewed in the light of modern criticism, it is probable that they were easily pardoned, if indeed they were ever discovered, by his contemporaries. For it was on the artistic rather than on the critical side of history that stress was almost universally laid in antiquity, and the thing that above all others was expected from the historian was not so much a scientific investigation and accurate exposition of the truth, as its skilful presentation in such a form as would charm and interest the reader. In this sense Cicero, *De Legg.*, i. 2, speaks of history as an "opus oratorium," and Quintilian, x. 1, as "a prose poem" (carmen solutum); and so we find that in the judgment of ancient critics it is by their artistic merits that historians stand or fall. Tried by this standard, Livy deservedly won and held a place in the very first rank. Asinius Pollio sneered at his Patavinity, and the emperor Caligula denounced him as verbose, but with these exceptions the opinion of antiquity was unanimous in pronouncing him a consummate literary workman. The classical purity of his style, the eloquence of his speeches, the skill with which he depicted the play of emotion, and his masterly portraiture of great men, are all in turn warmly commended, and in our own day we question if any ancient historian is either more readable or more widely read. It is true that for us his artistic treatment of history is not without its drawbacks. The more trained historical sense of modern times is continually shocked by the obvious untruth of his coloring, especially in the earlier parts of his history, by the palpable unreality of many of the speeches, and by the naiveté with which he omits everything, however important, which he thinks will weary his readers. But in spite of all this we are forced to acknowledge that, as a master of what we may perhaps call "narrative history," he has no superior in antiquity; for, inferior as he is to Thucydides, to Polybius, and even to Tacitus in philosophic power and breadth of view, he is at least their equal in the skill with which he tells his story. He is indeed the prince of chroniclers, and in this respect not unworthy to be classed even with Herodotus (Quint., x. 1). Nor is anything more remarkable than the way in which Livy's fine taste and sense of proportion, his true poetic feeling and genuine enthusiasm, saved him from the besetting faults of the mode of treatment which he adopted. The most superficial comparison of his account of the earliest days of Rome with that given by Dionysius shows from what depths of tediousness he was preserved by these qualities. Instead of the wearisome prolixity and the misplaced pedantry which make the latter almost unreadable, we find the old tales briefly and simply told. Their primitive beauty is not marred by any attempt to force them into an historical mould, or disguised beneath an accumulation of the insipid inventions of later times. At the same time they are not treated as mere tales for children, for Livy never forgets the dignity that belongs to them as the prelude to the great epic of Rome, and as consecrated by the faith of generations. Perhaps an even stronger proof of the skill which enabled Livy to avoid dangers which were fatal to weaker men is to be found in his speeches. We cannot indeed regard them, with the ancients, as the best part of his history, for the majority of them are obviously unhistorical, and nearly all savor somewhat too much of the rhetorical schools to be perfectly agreeable to modern taste. To appreciate them we must take them for what they are, pieces of declamation, intended either to enliven the course of the narrative, to place vividly before the reader the feelings and aims of the chief actors, or more frequently still to enforce some lesson which the author himself has at heart. The substance no doubt of many of them Livy took from his authorities, but their form is his own, and, in throwing into them all his own eloquence and enthusiasm, he not only acted in conformity with the established traditions of his art, but found a welcome outlet for feelings and ideas which the fall of the republic had deprived of all other means of expression. To us, therefore, they are valuable not only for their eloquence, but still more as giving us our clearest insight into Livy's own sentiments, his lofty sense of the greatness of Rome, his appreciation of Roman courage and firmness, and his reverence for the simple virtues of older times. But, freely as Livy uses this privilege of speech-making, his correct taste keeps his rhetoric within reasonable limits. With a very few exceptions the speeches are dignified in tone, full of life, and have at least a dramatic propriety, while of such incongruous and labored absurdities as the speech which Dionysius puts into the mouth of Romulus, after the rape of the Sabine women, there are no instances in Livy.

But, if our estimate of the merits of his speeches is moderated by doubts as to his right to introduce them at all, no such scruples interfere with our admiration for the skill with which he has drawn the portraits of the great men who figure in his pages. We may indeed doubt whether in all cases they are drawn with perfect accuracy and impartiality, but of their life-like vigor and clearness there can be no question. With Livy this portrait-painting was a labor of love. "To all great men," says Seneca, "he gave their due ungrudgingly," but he is at his best in dealing with those who, like Q. Fabius Maximus, "the Delayer," were in his eyes the most perfect types of the true Roman. Over their pictures he lingers with loving care. Each act of their lives, and every speech that is put into their mouths, adds something to the completeness of the sketch, or brings into stronger relief its characteristic features, and thus the desired impression is produced more indelibly than by pages of critical analysis or panegyric.

The general effect of Livy's narrative is no doubt a little spoilt by the awkward arrangement, adopted from his authorities, which obliges him to group the events by years, and thus to disturb their natural relations and continuity. As the result his history has the appearance of being rather a series of brilliant pictures loosely strung together than a coherent narrative. But it is impossible not to admire the copious variety of thought and language, and the evenly flowing style which car-

ried him safely through the dreariest periods of his history; and still more remarkable is the dramatic power he displays when some great crisis or thrilling episode stirs his blood. The sentences with which he begins his account of the sack of Rome by the Gauls are impressive in their solemn simplicity:—"In the same year one M. Cædicius, a plebeian, gave notice to the tribunes that in the new road where now there standeth a chapel, above the temple of Vesta, there was in the still time of the night a voice heard, louder than any man's, commanding that the magistrates should be told that the Gauls were coming" (vi. 32). With genuine tragic irony he describes how, as the hour of their fate drew nigh, the minds of the Romans were blinded (vi. 37), and how they forgot their ancient cunning in counsel and their courage in the fight, till "full unhappily and in an ill hour" they were scattered to the winds by their foes. Equally vivid is his picture of the self-devotion of the senators who refused to save themselves by flight—"then the elders that had triumphed aforetime, and been consuls, openly gave out and said that they would live and die together with them." . . . But we have not space to follow the story to its triumphant close, when the banished Camillus arrived to save the country which had driven him into exile. Nor can we do more than refer to the description of the forced march of the consul Claudius in the Second Punic War, of the battle by the river Metaurus, and the death of Hasdrubal.

Livy, however, is not always at his best. For the full exercise of his powers he seems to require either the stimulus supplied by the absorbing interest of the particular events he is describing, or the absence of any authority so full and so little to be disregarded as to fetter his freedom. Certain it is that in his accounts of the kingly period, and of the Hannibalic war, he is seen to much better advantage than in the fourth and fifth decades. We may naturally suppose too that his energies flagged as the work progressed; and in the extant fragments of the ninety-first book other critics besides Niebuhr have detected the signs of failing strength.

In style and language Livy represents the best period of Latin prose writing. He has passed far beyond the bald and meagre diction of the early chroniclers. In his hands Latin acquired a flexibility and a richness of vocabulary unknown to it before. If he writes with less finish and a less perfect rhythm than his favorite model Cicero, he excels him in the varied structure of his periods, and their adaptation to the subject-matter. It is true that here and there the "creamy richness" of his style becomes verbosity, and that he occasionally draws too freely on his inexhaustible store of epithets, metaphors, and turns of speech; but these faults, which did not escape the censure even of friendly critics like Quintilian, are comparatively rare in the extant parts of his work. From the tendency to use a poetic diction in prose, which was so conspicuous a fault in the writers of the silver age, Livy is not wholly free. In his earlier books especially there are numerous phrases and sentences which have an unmistakably poetic ring, recalling sometimes Ennius and more often his contemporary Virgil (see for instance Teuffel, p. 482, n. 14). But in Livy this poetic element is kept within bounds, and serves only to give warmth and vividness to the narrative. Similarly, though the influence of rhetoric upon his language, as well as upon his general treatment, is clearly perceptible, he has not the perverted love of antithesis, paradox, and labored word-painting which offends us in Tacitus; and, in spite of the Venetian richness of his coloring, and the copious flow of his words, he is on the whole wonderfully natural and simple.

These merits, not less than the high tone and easy grace of his narrative and the eloquence of his speeches, gave Livy a hold on Roman readers such as only Cicero and Virgil besides him ever obtained. His history formed the groundwork of nearly all that was afterwards written on the subject. Plutarch, writers on rhetoric like the elder Seneca, moralists like Valerius Maximus, went to Livy for their stock examples. Florus and Eutropius abridged him; Orosius extracted from him his proofs of the sinful blindness of the pagan world; and in every school Livy was firmly established as a text-book for the Roman youth.

By far the most complete account of the various editions of Livy, and of all that has been written upon him, will be found in Emil Hübner's *Grundriss zu Vorlesungen über die Römische Literaturgeschichte*, 4th ed., Berlin, 1878. The most successful translation of his history is that by Philemon Holland, London, 1600. (H. F. P.)

LIZARD. The name Lizard (Lat., *lacerta*) originally referred only to the small European species of four-legged reptiles, but is now applied to a whole order (*Lacertilia*), which is represented by extremely numerous species in all temperate and tropical parts of the globe. Lizards may be described as reptiles with a more or less elongate body terminating in a tail, and with the skin either folded into scales (as in snakes) or granular and tubercular; legs are generally present—usually four, rarely two in number—but sometimes they are reduced to rudiments or entirely hidden below the skin; the jaws are toothed, and the two mandibles firmly united in front by an osseous suture. Eyelids are generally present. The vent is a transverse slit, and not longitudinal as in Crocodilians. Other structural characteristics, especially of the skeleton, separate lizards from the other orders of reptiles; but will be better understood if described in relation to the other members of that class. See REPTILES.

At a low estimate the number of described species of lizards may be given as about one thousand seven hundred.[1] They are extremely scarce north of 60° N. lat.; and in the southern hemisphere the southern point of Patagonia forms the furthest limit of their range. As we approach the tropics, the variety of forms and the number of individuals increase steadily, the most specialized and the most developed forms (the monitors and leguans) being restricted to the tropical regions where lizards abound. They have adapted themselves to almost every physical condition, except the extreme cold of high latitudes or altitudes. Those inhabiting temperate latitudes hibernate. The majority live on broken ground, rocks with or without vegetation; others are arboreal; to a few (certain monitors) the neighborhood of water is a necessity; whilst others are true desert animals, in color scarcely distinguishable from their surroundings. Some, like many geckos, live near or in houses, being enabled by a peculiar apparatus of their toes to run along perpendicular and even overhanging surfaces. No lizard enters the sea, with the exception of one species, the leguan of the Galapagos (*Amblyrhynchus*), which feeds on sea-weed. Some, like the majority of the geckos, are nocturnal.

The motions of most lizards are executed with great but not enduring rapidity. With the exception of the chamæleon, all drag their body over the ground, the limbs being wide apart, turned outwards, and relatively to the bulk of the body generally weak. But the limbs show with regard to development great variation, and an uninterrupted transition from the most perfect condition of two pairs with five separate clawed toes to their total disappearance; yet even limbless lizards retain rudiments of the osseous framework below the skin. The motions of these limbless lizards are very similar to those of snakes, which they resemble in their elongate body passing into a long cylindrical and tapering tail.

In a great many lizards (*Lacertidæ*, skinks, geckos) the muscles of the several vertebral segments of the tail are so loosely connected, and the axis of the vertebræ is so weak, that the tail breaks off with the greatest

[1] The two latest general works on lizards are those by Duméril and Bibron (*Erpétologie générale*, with atlas, tom. i.–ix., Paris, 1834–54, 8vo), and by J. E. Gray (*Catalogue of Lizards in the Collection of the British Museum*, London, 1845, 8vo). Both are now antiquated, and a new edition of either is much required.

facility. The part severed retains its muscular irritability for a short time, wriggling as if it were a living creature. A lizard thus mutilated does not seem to be much affected by its loss, and in a short time the part is reproduced; but, whilst the muscles and also the integuments may be perfectly regenerated, the osseous part always remains replaced by a cartilaginous rod, without vertebral segmentation. This faculty is of great advantage to the lizards endowed with it; they are either species in which the tail has no special function, such as to assist in a particular kind of locomotion or to serve as a weapon of defence, or they are small species which lack other means of escape from their numerous enemies. The geckos are even able to throw off their tail spontaneously, and are said to do this frequently when pursued by some other animal, which is satisfied with capturing the wriggling member, whilst the owner saves its life by a rapid flight.

The majority of lizards are carnivorous, the larger feeding on small mammals, birds, fishes, and eggs, the smaller on insects, worms, and other invertebrates. Not a few, however, are herbivorous, as the larger leguans, and many agamas. This difference in diet is quite independent of modifications of dentition. Generally the teeth are simply conical, pointed, more rarely blunt, or notched at the top or sides, Always anchylosed with the bone, they are inserted either on the inner side of the margin of the jaws (*pleurodontes*), or on the edge of the bones (*acrodontes*). The form of the tongue exhibits many modifications which have been used for the division of the order into families. as will be seen from the systematic list given below.

All lizards are oviparous, the eggs being of an oval shape, and covered with a hard or leathery calcareous shell. The number of eggs laid is, in comparison with other reptiles, small, perhaps never exceeding forty, and some, like the anolis and geckos, deposit only one or two at a time, but probably the act of oviposition is repeated in these lizards at frequent intervals. The parents do not take care of their progeny, and leave the eggs to hatch where they were deposited. In a few lizards, however, the eggs are retained in the oviduct until the embryo is fully developed; these species, then, bring forth living young, and are called *ovoviviparous*.

No lizard is venomous, with, perhaps, a single exception (*Heloderma*) to be mentioned hereafter.

The order of lizards may be divided into the following suborders and families:—

First suborder.—Cionocrania.

Vertebræ procœlian; an orbital ring with a temporal bar more or less complete; columella present; parietal bone single.

Family 1. *Monitoridæ.*—Scales of the belly oblong, quadrangular, in cross-bands, on the back and tail rhombic, very small or granular. Tongue very long, exsertile, ending in two long filaments, sheathed at the base. Head with small polygonal shields. The largest lizards, inhabiting the African, Indian, and Australian regions.

Genera: *Psammosaurus, Odatria, Varanus* (*Monitor*), *Hydrosaurus.*

Family 2. *Tejidæ.*—Scales small, granular, sometimes with larger tubercles; those of the belly oblong, quadrangular, in cross-bands. Head with large symmetrical scutes. Tongue long, scaly, bifid at the end. Dentition acrodont. No fold of the skin along the sides. Tropical and subtropical America.

Genera: *Tejus, Callopistes, Ameiva, Cnemidophorus, Dicrodon, Acrantus, Centropyx, Crocodilurus, Ada, Custa.*

Family 3. *Lacertidæ.*—Scutellation as in the preceding family. Tongue long, exsertile, bifid at the end, without sheath at the base. Dentition pleurodont. Old World, especially from the Europo-Asiatic, African, and Indian regions.

Genera: *Lacerta, Tropidosaura, Tachydromus, Ichnotropis, Acanthodactylus, Psammodromus, Scraptcira, Eremias, Mesalina, Cabrita, Ophiops, Chondrophiops, Tracheloplychus.*

Family 4. *Xanthusiidæ*—Distinguished from the preceding family by a broader non-exsertile tongue. California, Central America, and Cuba.

Genera: *Xanthusia, Lepidophyma, Cricosaura.*

Family 5. *Trachydermi.*—Scales arranged in transverse rows, frequently swollen or tubercular. Tongue ending in two short points. Dentition pleurodont. No femoral pores. Central America, extending into the subtropical parts of North America.

Genera: *Heloderma, Gerrhonotus.*

Family 6. *Zonuridæ.*—Scales arranged in transverse rows, quadrangular, those of the back generally keeled; a fold of the skin runs along the side of the body, separating the upper from the lower parts. Head with large symmetrical shields. Tympanum distinct. African region; *Pseudopus* from the Europo-Asiatic, and *Ophisaurus* from the North American region.

Genera: *Cordylus, Zonurus, Platysaurus, Gerrhosaurus, Pleurostrichus, Saurophis, Cailia, Pseudopus, Ophisaurus, Hyalosaurus.*

Family 7. *Chalcididæ.*—Scales arranged in transverse bands, quadrangular; scarcely a trace of a lateral fold in front. Head with large symmetrical shields. Tongue scaly, bifid in front. Tympanum hidden. Body long, with rudimentary limbs. Tropical America.

Genera: *Brachypus, Microdactylus, Chalcis, Ophiognomon, Bachia, Propus, Heterodactylus.*

Family 8. *Cercosauridæ.*—Scales rhombic or quadrangular, generally arranged in transverse series. No lateral fold, or only a trace of it. Head with large symmetrical shields. Tongue scaly, bifid in front. Tympanum distinct. Body moderately elongate, with four developed limbs. Males with femoral pores. Tropical America.

Genera: *Cercosaura, Pantodactylus, Chalcidolepis, Iphisa, Perodactylus, Placosoma, Holaspis, Lepidosoma, Ecpleopus, Euspondylus, Cricosaura, Proctoporus, Urosaura, Emphrassotis, Lepidophyma Loxopholis, Trelioscincus.*

Family 9. *Chamæsauridæ.*—Body slender, with rudimentary limbs. Scales arranged in transverse series, equal all round the body, provided with a sharp keel, the keels forming longitudinal ridges; no lateral fold. Tympanum distinct. Tongue with a very shallow notch in front. South Africa.

Genus: *Chamæsaura.*

Family 10. *Gymnophthalmidæ.*—The entire body is covered with rounded imbricate quincuncial scales; head with symmetrical shields. No eyelids. Nostrils lateral, in a single shield. Body long, with the limbs small or rudimentary. Irregularly distributed over the tropical regions.

Genera: *Gymnophthalmus, Epaphelus, Ablepharus, Blepharosteres, Cryploblepharus, Morethia, Menetia, Miculia, Lerista, Blepharactisis.*

Family 11. *Pygopodidæ.*—Scutellation as in the preceding family, but the nostrils are situated above the upper edge of the first labial shield. No eyelids. Body long, with a pair of rudimentary hind limbs only. Australia.

Genera: *Pygopus, Delma.*

Family 12. *Aprasiidæ.*—Scutellation as in the preceding families, the nostrils in a suture between the nasal and first labial shields. No eyelids. Limbs none. Australia.

Genus: *Aprasia.*

Family 13. *Lialidæ.*—Scales imbricate, quincuncially arranged; head with imbricate scale-like shields. No eyelids. Body long, with a pair of rudimentary hind limbs only. Australia.

Genus: *Lialis.*

Family 14. *Scincidæ.*—The entire body is covered with rounded imbricate scales, quincuncially arranged; head with symmetrical shields. Eyelids developed. Nostrils behind the rostral, in a separate shield, or between two or three small shields. Tongue short, with a notch in front. Ground-lizards.—This family has so wide a distribution that its range almost coincides with that of the order generally.

The following genera are composed of numerous species, and extend over several geographical regions: *Hinulia* (Indian and Australian regions), *Eumeces*, including *Mocoa* and *Riopa*, *Lygosoma* and *Chelomeles* (Indian and Australian regions), *Plestiodon* (Europo-Asiatic, North American, and Indian regions), *Mabouia* and *Tiliqua* (*Euprepes*), generally distributed in the tropical and subtropical regions, *Heteropus* (Indian and Australian regions), *Sphenops* and *Gongylus* (Europo-Asiatic and African regions.)

Indian genera: *Lipinia, Amphixestus, Lygosaurus, Cophoscincus, Ristella, Podophis, Chiamela, Senira, Brachymeles, Hagria, Tropidophorus, Norbea, Dasia, Sphenocephalus, Sepophis.*

Australian genera: *Hemiergis, Tetradactylus, Omolepida, Siaphos, Anomalopus, Rhodona, Ophioscincus, Soridia, Lioscincus, Tribolonotus, Trachydosaurus, Corucia, Cyclodus, Silubosaurus, Egernia, Tropidolepisma, Tropidoscincus, Nannoscincus, Ophiosceps.*

Tropical American genera: *Ophiodes, Celestus, Camilia, Diploglossus, Sauresia, Panolopus.*

African genera: *Liolepisma, Dumerilia, Pygomeles, Eumecia, Scelotes, Thyrus, Amphiglossus, Sepsina, Sepomorphus, Herpetosaura, Sepacontias.*

Europo-Asiatic genera: *Scincus, Anguis Ophiomorus, Zygnopsis, Hemipodion, Seps, Heteromoreles.*

North American genus: *Anniella.*

Family 15. *Acontiidæ.*—Scutellation similar to that of the

skinks, but the rostral shield is enlarged, cup-shaped, the nostril being in the rostral, with a long slit between it and the hinder margin of the rostral. Eyes distinct, with a lower eyelid. Limbs rudimentary or absent. Africa, Madagascar, and Ceylon.

Genera: *Nessia, Evesia, Acontias, Aparallactus.*

Family 16. *Typhlinidæ.*—Differing from the preceding family by having the eyes hidden under the skin. Africa, East Indian Archipelago, New Guinea.

Genera: *Typhlosaurus, Feylinia, Dibamus.*

Family 17. *Iguanidæ.*—Scales of the back and sides imbricate, generally in transverse, oblique rows, those of the belly similar; head with numerous, irregular small scutes. Tongue short, scarcely notched in front, not exsertile. Dentition pleurodont; teeth frequently compressed towards the point. Toes 5–5. The whole of this large family are found in the New World, with the exception of two genera, one (*Brachylophus*) inhabiting the Fiji Islands, the other (*Hoplurus*) Madagascar.

The genera may be divided into two groups,—one comprising arboreal forms with compressed slender body, slender legs, and long tail, the other forms, which live on the ground, with a broader, more depressed body, stouter legs, and shorter tail. Both groups pass into each other.

Arboreal genera: *Polychrus, Urotrophus, Ecphymotes, Læmanctus, Iguana, Aloponotus, Brachylophus, Metopoceros, Trachycephalus, Oreocephalus, Cyclura, Ctenosaura, Enyaliosaurus, Basiliscus, Corythæolus, Corythophanes, Chamæleopsis, Ophryoessa, Ophryoessoides, Enyalius, Chamælcolis, Xephosurus, Dactyloa, Xiphocercus, Acanthotis, Norops, Anolis, Uraniscodon, Ptica.*

Terrestrial genera: *Tropidolepis* (*Sceloporus*), *Liodera, Liolæmus, Pygoderus, Proctotretus, Liocephalus, Hetocephalus, Scartiscus, Stenocercus, Trachycyclus, Holbrookia, Uta, Aneuporus, Taraguira, Tropidurus, Microphactus, Anisophractus, Hoplurus, Hoplocercus, Strobilurus, Liosaurus, Diplolæmus, Sauromalus, Cachryx, Uranocentron, Crotaphytus, Phymaturus, Centrura, Callisaurus, Uma, Tropidogaster, Phrynosoma.*

Family 18. *Agamidæ.*—Differing from the preceding family by their acrodont dentition. The tropical regions of the Old World and Central Asia.

Arboreal Indian genera: *Draco, Sitana, Lyriocephalus, Arpephorus, Ceratophora, Cophotis, Otocryptis, Gonyocephalus, Japalura, Dilophyrus, Orotiaris, Tiaris, Acanthosaura, Calotes, Bronchocæla, Salea, Lophocalotes, Hypsiurus, Gonyocephalus, Lophura, Physignathus.*

Terrestrial Australian genera: *Chelosania, Gindalia, Chlamydosaurus, Lophognathus, Diporophora, Grammatophora, Tympanocryptis, Moloch.*

Terrestrial African, Indian, and Asiatic genera: *Stellio, Agama, Charasia, Trapelus, Brachysaura, Phrynocephalus, Megalochilus, Centrotrachelus, Uromastyx, Liolepis, Chalarodon.*

Second Suborder.—Chamæleonoidea.

Vertebræ procœlian; a bar crossing from the parietal to the mastoid; temporal bar complete. No columella. Parietal bone single.

Family 1. *Chamæleontidæ.*—Body granular. Toes 5–5, formed into two grasping opposable groups. Tongue very long, worm-shaped, very extensile. Exclusively arboreal. Africa and Madagascar, one species extending into Europe and India.

Genera: *Chamæleon, Rhampholeon.*

Third Suborder.—Nyctisaura.

Vertebræ amphicœlian; orbital ring and temporal bars not developed. A columella. Parietal bone paired.

Family 1. *Geckotidæ.*—Upper parts granular, rarely with scales; lower parts covered with imbricate scales. Tongue thick, short, slightly notched in front. Eyes large, without (very rarely with) eyelids. Body depressed. Toes frequently with a more or less developed adhesive apparatus. Tropical and subtropical regions.

Genera with a wide range: *Hemidactylus* (*Peripia*), *Phyllodactylus* (not extending into the Indian region), *Diplodactylus* (Tropical America, Australia, and Africa), *Thecadactylus* (Tropical America and Australia), *Platydactylus* (Africa and Australia), *Heteronota* (Indian and Australian regions), *Phelsuma* (Indian and African regions).

Tropical American genera: *Caudiverbera, Aristelliger, Sphærodactylus, Homonota, Goniodactylus.* Some of these genera go beyond the limits of the tropics southwards or northwards.

New Zealand genus: *Naultinus.*

Australian genera: *Œdura, Rhynchœdura, Strophura, Stenodactylopsis, Correlophus, Ceratolophus, Gehyra, Nephrurus, Phyllurus.*

Indian genera: *Spathodactylus, Callodactylus, Ptyodactylus, Nyctiridium, Pentadactylus, Gecko, Luperosaurus, Ptychozoon, Eublepharis, Geckoella, Cyrtodactylus, Gymnodactylus, Teratolepis.*

African genera: *Parœdura, Ebenavia, Rhoptropus, Uroplates, Theconyx, Tarentola, Pachydactylus, Psilodactylus, Pristiurus, Stenodactylus, Chondrodactylus, Geckolepis, Spatalura.*

Europo-Asiatic genera: *Bunopus, Ceramodactylus, Teratoscincus, Agamura.* These inhabit only the southern parts of the region in Asia; representatives of some African or Indian genera (viz., *Ptyodactylus, Tarentola, Gymnodactylus,* and *Stenodactylus*) likewise extend into this region.

This list, from which many subgenera have been excluded, will give an idea of the wide distribution of the order of lizards, and of the great variety of forms which it comprises. Indeed, in both respects, it far surpasses the other orders of reptiles. The scope of the present article does not permit us to enter into further taxonomic details, but a few notes may be added on some lizards, to which special interest is attached, or of which most frequent mention is made in general literature.

The first family, that of *Monitoridæ*, comprises very large lizards, the largest exceeding a length of 6 feet. Some are terrestrial, others semi-aquatic, the former having a rounded the latter a compressed tail with a sharp, saw-like upper edge, which assists them greatly in swimming, and at the same time forms a formidable weapon with which these powerful animals can inflict deep wounds on the incautious captor. They range all over Africa, the Indian region, and Australia; their prey consists of other vertebrate animals, small mammals, birds, frogs, fishes, and eggs. The young are

Fig. 1.—Monitor of the Nile (*Monitor niloticus*).

prettily spotted with white and black ocelli, the old ones having a plainer coloration. The Monitor of the Nile (*Monitor niloticus*, fig. 1) is an aquatic species found in the neighborhood of all large rivers of tropical Africa. The Arabs know it well under the name *Waran* (whence the generic name *Varanus* is derived), and it frequently appears also among the engravings and hieroglyphs of ancient Egypt. Some respect was and is still paid to it, as it is said to prey largely on the eggs of crocodiles. Another Monitor, the *Waran el ard* of the Arabs (*Psammosaurus scincus*), also inhabits North Africa, but is strictly terrestrial, and has a rounded tail.

Most of the European lizards with four well-developed limbs belong to the genus *Lacerta*. They are of small size, and insectivorous. Their tongue is deeply cleft at the end, and is frequently exserted when the animal is in a state of excitement from fear or anger. As in all the lizards of the family *Lacertidæ*, their tail is easily broken, and as readily reproduced, the repro-

duced portion often assuming a monstrous or double shape, so that the animal appears to be provided with two tails. Only three species occur in Great Britain (see fig. 2). The Common Lizard (*Lacerta vivipara*) frequents heaths and banks in England and Scotland, and is locally met with also in Ireland; it is ovoviviparous. Much scarcer is the second species, the Sand Lizard (*Lacerta agilis*), which is confined to some localities in the south of England, the New Forest and its vicinity; it does not appear to attain on English soil to the same size as on the Continent, where it abounds, growing sometimes to a length of 9 inches. Singularly, a snake (*Coronella lævis*), also common on the Continent, and feeding principally on this lizard, has followed it across the British Channel, apparently existing in those localities only in which the sand-lizard has settled. This lizard is oviparous. The males differ by their brighter green ground color from the females, which are brown, spotted with black. The third British species, the Green Lizard (*Lacerta viridis*), does not occur in England proper; it has found a congenial home in the island of Guernsey, but is there much less developed as regards size and beauty than in the countries south of the Alps and Pyrenées. This species is larger than the two preceding; it is green, with minute blackish spots. In Germany and France one other species only (*Lacerta muralis*) appears; but in the south of Europe the species of *Lacerta* are much more numerous, the largest and finest being *L. ocellata*, which grows to a length of 18 or 20 inches, and is brilliantly green, ornamented with blue eye-like spots on the sides. Even the small island-rocks of the Mediterranean, sometimes only a few hundred yards in diameter, are occupied by peculiar races of lizards, which of late years have attracted much attention from the fact that they, like other reptiles, have assumed under such isolated conditions a more or less dark, almost black, coloration.

Heloderma horridum is a Mexican lizard, which in its native country has the reputation of being a most poisonous reptile. Its anterior teeth are, indeed, provided with a deep groove, as in many poisonous snakes, and the submaxillary gland is enormously developed. Sumichrast has recently proved by actual experiment on mammals the fatal effects of the bite of this lizard; and J. Stein, a traveller in Mexico, who was bitten in the finger, suffered from symptoms similar to those resulting from the bite of a poisonous snake. It thus appears that the fear in which it is held by the natives is not due merely to its hideous appearance, as was formerly believed. Tubercles of a dirty brown and yellow color, with which its body is covered, give it the appearance of a leprous skin. It is about 20 inches long, and is known by the name of "Escorpion."

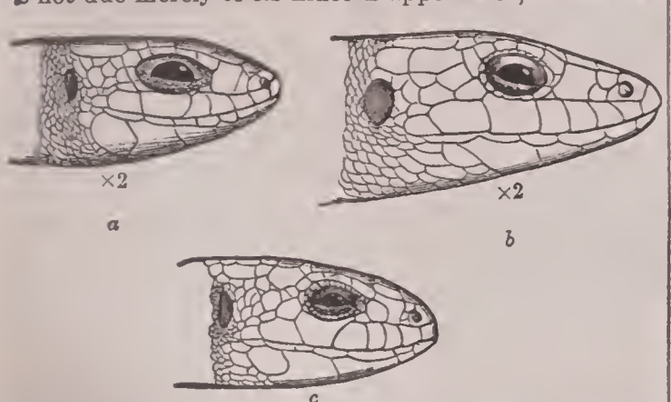

FIG. 2.—Heads of British Lizards. *a, Lacerta vivipara; b, L. agilis; c, L. viridis.*

The Glass-Snake (*Pseudopus pallasii*) or *Sheltopusik* (Russ.) is common in Dalmatia, Hungary, southern Russia, and the western parts of Central Asia. Externally it resembles a snake, the fore limbs being entirely absent, and the hind limbs reduced to small rudiments. It attains to a length of 2 or 3 feet, and feeds on insects, worms, mice, and small birds. In captivity it becomes perfectly tame. North America is inhabited by a very similar glass-snake (*Ophisaurus*), and North Africa by a third (*Hyalosaurus*). Limbless lizards are especially common in Australia, but their scutellation is so different from that of the glass-snakes of the northern hemisphere that they are placed in distinct families, which have been noticed in the systematic list (*Pygopodidæ*, *Aprasiidæ*, *Lialidæ*).

FIG. 3.—Head of Leguan (*Iguana rhinolophus*).

The family of skinks also includes many genera with rudimentary limbs or without any, the Slow-Worm or Blind-Worm (*Anguis fragilis*) being the one most generally known. It is distributed over the greater part of Europe, and rarely exceeds a length of 15 inches. Its eyes, although small, are perfectly developed and provided with eyelids. It is ovoviviparous; the young, in the first year of their life, differ considerably from the old in their coloration, the back being of a milk-white color, with a black line down the middle. In the south of Europe it gradually disappears, and its place is taken by the similarly shaped *Seps*, a genus distinguished from *Anguis* by the presence of four very small rudiments of limbs, which have no function.

The Skink, which has given the name to the whole family, is a small lizard (*Scincus officinalis*) of 6 or 8 inches in length, common in arid districts of North Africa and Syria. A peculiarly wedge-shaped snout, and toes provided with strong fringes, enable this animal to burrow rapidly in and under the sand of the desert. In former times large quantities of it were imported in a dry state into Europe for officinal purposes, the drug having the reputation of being efficacious in diseases of the skin and lungs; and even now it may be found in apothecaries' shops in the south of Europe, country people regarding it as a powerful aphrodisiac for cattle.

Of the family *Iguanidæ* we refer to three genera only:—*Iguana*, *Anolis*, and *Phrynosoma*. Herpetologists distinguish several species of *Iguana* or Leguans,

which, however, do not appear to differ in their habits. They are found in the forest regions of tropical America only, in the neighborhood of water, into which when frightened they jump from the overhanging branches of trees, to escape capture by swimming and diving. Feeding exclusively on leaves or fruits, they are themselves highly esteemed as food, and their eggs also are eagerly searched for by the natives. Iguanas grow to a length of from 2 to 5 feet, and are readily recognized by a row of long compressed and pointed scales which form a more or less high crest along the middle of the back and tail, and by a compressed and pendent dewlap at the throat. These large lizards are strictly arboreal, and of a brilliant coloration, in which green prevails.

The smallest lizards of this family belong to the genus *Anolis*, extremely numerous as regards species and individuals on bushes and trees of tropical America, and especially of the West Indies. They offer many points of analogy to the humming birds in their distribution, colors, and even disposition. Gosse (*A Naturalist's Sojourn in Jamaica*, pp. 75 *sq.*) has given a vivid and faithful description of their manners. Hundreds may be seen on a bright day, disporting themselves on the trees and fences, leaping from branch to branch, fearlessly entering houses, chasing each other, or engaging in combat with some rival. Like the iguanas, they (at least the males) are provided with a large, expansible dewlap at the throat, which is brilliantly colored, and which they display on the slightest provocation. This appendage is merely a fold of the skin, ornamental and sexual, like the wattles of the throat of a gallinaceous bird; it has no cavity in its interior, and has no communication with the mouth or with the respiratory organs; it is supported by the posterior horns of the hyoid bone, and can be erected and spread at the will of the animal. The presence of such dewlaps in lizards is always a sign of an excitable temper. The anolis possess the power of changing their colors in a most extraordinary degree, the brilliant iridescent hues of their body passing almost in an instant into a dull sooty brown in an irritated or alarmed animal. They are much fed upon by birds and snakes, and have, like all small much-persecuted lizards, a fragile tail, easily reproduced. They bring forth only one large egg at a time, but probably breed several times during the season.

The third iguanoid, *Phrynosoma*, is a terrestrial form. Several species are known, inhabiting the plains of south-western America and Mexico. Since the opening of the Pacific Railway, living specimens are frequently sent to Europe, and sold under the name of "California toads." Although they belong to the same family, a greater contrast than that between the nimble, slender, and long-tailed *Anolis* and the toad-like *Phrynosoma* can hardly be imagined. The body is short, broad, and depressed, ending in a short tail, covered with rough tubercles or spines; the short head is armed behind with long bony spikes; the colors are a motley of brown, black, and yellow. Their defence against birds lies chiefly in their outward appearance, as, whilst they rest quiet, they are difficult to distinguish from a stone overgrown with lichen; nor have we ever found their remains in the stomach of snakes, their spines proving a sufficient protection against these equally formidable enemies. They are said to move with rapidity in a wild state, but in confinement, especially when the animal believes itself observed, their movements are extremely sluggish and their manners uninteresting. It seems to be a common belief in California that they have the power of squirting a blood-red fluid from the corner of the eye to some distance; but nothing has been found, on anatomical examination, to establish the correctness of this assertion. They attain a length of from 6 to 8 inches.

Of the *Agamidæ*, which represent the iguanas in the Old World, and which have been differentiated into a still greater number of distinct generic forms, several genera deserve more than a merely nominal notice. The perhaps most highly specialized form are the Dragons (*Draco*), a genus of small lizards from the East Indies, more common in the archipelago than on the continent, but absent in Ceylon. The character by which they are at once recognized is the peculiar additional apparatus for locomotion, formed by the much-prolonged five or six hind ribs, which are connected by a broad expansible fold of the skin, the whole forming a subsemicircular wing on each side of the body. The snakes are the only order of vertebrates in which the ribs serve as organs of locomotion, but, whilst in that order all the ribs are charged with a function for which no other special organ exists, in the

Fig. 4.—Dragon (*Draco tæniopterus*).

dragons only a part of the ribs are modified for the purpose of assisting four well-developed limbs. The dragons are tree-lizards; they take long flying leaps from branch to branch, supported in the air by their expanded parachutes, which are laid backwards at the sides of the animal while it is sitting or merely running. If the hind or fore limbs of a dragon were cut off, it would be helpless, and deprived of locomotion, but it could continue to move with velocity after the loss of its wings. Like the anolis, whose analogues they are in the Old World, they are provided with long highly ornamented dewlaps. These appendages are found in both sexes, one in the middle and one on each side of the throat, but they are much more developed in the mature male. The tail is very long and slender, not fragile; we have never seen a dragon in which this member was mutilated; it seems to be necessary for their peculiar locomotion, and probably its loss soon proves fatal to the animal. Cantor says that the transcendent beauty of their colors baffles description. As the lizard lies in the shade along the trunk of a tree, its colors at a distance appear as a mixture of brown and gray, and render it scarcely distinguishable from

the bark. Thus it remains with no signs of life except the restless eyes watching passing insects, which, suddenly expanding its wings, it seizes with a sometimes considerable unerring leap. All the species attain a length of 7 or 8 inches, of which the tail takes at least one half. They deposit three or four eggs at a time.

Calotes is another genus of agamoids peculiar to the East Indies; it comprises numerous species well known in India by the name of "blood-suckers," a designation the origin of which cannot satisfactorily be traced. They are tree-lizards, extremely variable in their colors, which change, not only with the season, but also at the will of the animal. The males, and in some species also the females, possess a crest of compressed scales along the back.

Of the Australian agamas no other genus is so numerously represented and widely distributed as *Grammatophora*, the species of which grow to a length of from 8 to 18 inches. Their scales are generally rough and spinous; but otherwise they possess no strikingly distinguishing peculiarity, unless the loose skin of their throat, which is transversely folded and capable of inflation, be regarded as such. On the other hand, two other Australian agamoids have attained some celebrity by their grotesque appearance, due to the extraordinary development of their integuments. One (fig. 5) is the Frilled Lizard (*Chlamydosaurus*), which is restricted to Queensland and the north coast, and grows to a length of 2 feet, including the long tapering tail. It is provided with a frill-like fold of the skin round the neck, which, when erected, resembles a broad collar, not unlike the gigantic lace-collars of Queen Elizabeth's time. The late Mr. Krefft has made the observation that this lizard when startled, rises with the forelegs off the ground, and squats and jumps

Fig. 5.—Frilled Lizard (*Chlamydosaurus*).

in kangaroo fashion, thus reminding us of the peculiar locomotion ascribed to certain gigantic extinct reptiles. The other lizard is one which most appropriately has been called *Moloch horridus*. It is covered with large and small spine-bearing tubercles; the head is small, and the tail short. It is sluggish in its movements, and so harmless that its armature and (to a casual observer) repulsive appearance are its sole means of defence. It grows only to a length of 10 inches, and is not uncommon in the flats of South and West Australia.

The majority of the ground-agamas, and the most common species of the plains, deserts, or rocky districts of Africa and Asia, belong to the genera *Stellio* and *Agama*. They resemble much the *Grammatophora* of the Australian region, their scales being mixed with larger prominent spines, which in some species are particularly developed on the tail, and disposed in whorls. Nearly all travellers in the north of Africa

Fig. 6.—Forefoot of *Chamæleon o'shaughenesii*.

mention the *Hardhón* of the Arabs (*Stellio cordylinus*), which is extremely common, and has drawn upon itself the hatred of the Mohammedans by its habit of nodding its head, which they interpret as a mockery of their own movements whilst engaged in prayer. *Uromastyx* is one of the largest and most developed genera of ground-agamas, and likewise found in Africa and Asia. The body is uniformly covered with granular scales, whilst the short, strong tail is armed with powerful spines disposed in whorls. The Indian species (*U. harderickii*) feeds on herbs only; the African species probably take mixed food.

The Chamæleons are almost peculiar to the African region, and most numerous in Madagascar, where out of the thirty-six species known not less than seventeen occur. Only one species (*C. vulgaris*) extends into India and Ceylon. No other member of the order of lizards shows such a degree of specialization as the chamæleons. The tongue, eyes, limbs, tail, skin, lungs, are modified in a most extraordinary manner to serve special functions in the peculiar economy of these animals. They lead an exclusively arboreal life; each of their feet is converted into a grasping hand, by means of which, assisted by a long prehensile tail, they hold so fast to a branch on which they are sitting that they can only with difficulty be dislodged. Their movements are slow on the ground, and still more so in the water, where they are nearly helpless. As in ant-eaters, woodpeckers, or frogs, their tongue is the organ with which they catch their prey; it is exceedingly long, worm-like, with a club-shaped viscous end; they shoot it out of the mouth with incredible rapidity towards insects, which remain attached to it, and are thus caught. The globular eyes are covered with a circular lid pierced by a small central hole, and are so prominent that more than one-half of the ball stands out of the head. Not only can they be moved in any direction, but each has an action independent of the other; one eye may be looking forwards, whilst an object behind the animal is examined with the other. The lungs of the chamæleons are very capacious, and are inflated when the animal is angry or frightened. The faculty of changing color, which they have in common with many other lizards, is partly dependent on the degree in which the lungs are filled with air, and different layers of chromatophores are pressed towards the outer surface of the skin. Some species are only a few inches long, whilst others attain to a length of 18 and 20 inches. The majority are oviparous, a few ovoviviparous.

Almost all the lizards belonging to the family of *Geckos* may be recognized at first sight; the head is broad and depressed, the eyes large, the body depressed; the tail is thick at the base, tapering, generally somewhat deformed, as a specimen is rarely met with in

which this member is not reproduced. The limbs are stout, rather short, with at least four of the toes well developed. Geckos are found in almost every part of the globe between and near the tropics, frequenting houses, rocks, and trees; and some of the species are so numerous around and within human dwellings as to be most familiar objects to the inhabitants. Many are able to run up and along the surface of a wall or of any other perpendicular object; for this purpose the lower surface of their toes is provided with a series of movable plates or disks,[1] by the aid of which they

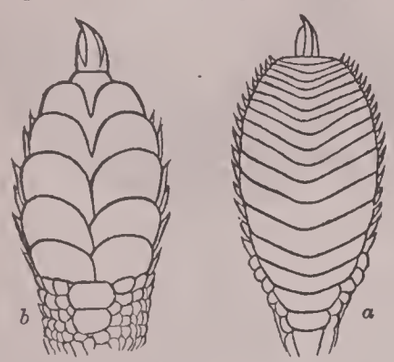

Fig. 7.—Lower Surface of the Toe of (*a*) *Gecko*, (*b*) *Hemidactylus*—enlarged.

adhere to the surface over which they pass. In forest-species this apparatus is generally less developed, or entirely absent, claws being of greater use for walking up the rough bark of a tree. Geckos, with few exceptions, are nocturnal and, consequently, large-eyed animals, the pupil being generally contracted in a vertical direction, shaped like two rhombs placed with the angles towards each other. They are of small size, the largest species not exceeding 10 or 14 inches in length. They are carnivorous, destroying moths and all kinds of insects, and even the younger and weaker members of their own species. They have been seen devouring the skin which they cast off, and their own wriggling tail. They are of a fierce disposition, frequently fighting among themselves; but house-geckos readily become habituated to the presence of man; accustomed to be fed at a certain time with rice, these little lizards will punctually make their appearance, and fearlessly take the proffered food. Another peculiarity of geckos is that they, or at least some genera, are endowed with a voice. The large *Gecko guttatus* and *G. monarchus* of the East Indies utter a shrill cry, sounding like "tokee" or "tok." The common species found in houses in the south of Europe are a species of *Hemidactylus* (*H. verruculatus*) and *Tarentola*, the terrentola of the Italians. All geckos seem to be oviparous. (A. C. G.)

LLAMA, sometimes spelt *Lama*, a word by which the Peruvians designated one of a small group of closely allied animals, which, before the Spanish conquest of America, were the only domesticated hoofed mammals of the country, being kept, not only for their value as beasts of burden, but also for their flesh, hides, and wool,—in fact, supplying in the domestic economy of the people the place of the horse, the ox, the goat, and the sheep of the Old World. The word is now sometimes restricted to one particular species or variety of the group, and sometimes used in a generic sense to cover the whole. Although they were often compared by early writers to sheep, and spoken of as such, their affinity to the camel was very soon perceived, and they were included in the genus *Camelus* in the *Systema Naturæ* of Linnæus. They were, however, separated by Cuvier in 1800 under the name of *Lama*, changed by Illiger in 1811 to *Auchenia* (in allusion to the great length of neck, *αὐχήν*), a term afterwards adopted by Cuvier, and almost universally accepted by systematic zoologists, although there has been of late a disposition to revive the earlier name.

[1] The mechanism resembles in some the adhesive organ of *Echeneis* or sucking-fish, in others that of the legs of a fly.

The animals of the genus *Auchenia* or *Lama* are, with the two species of true camels (to which the generic term *Camelus* is now restricted), the sole existing representatives of a very distinct section of the "artiodactyle" or even-toed ungulates, called *Tylopoda*, or "boss-footed," from the peculiar bosses or cushions placed on the under surface of their feet, and on which they tread. This section thus consists of a single family, the *Camelidæ*, the other sections of the same great division being the *Suina* or pigs, the *Tragulina* or chevrotains, and the *Pecora* or true ruminants, to each of which the *Tylopoda* have more or less affinity, standing in some respects in a central position between them, borrowing as it were some characters from each, but in others showing great special modifications not found in any of the other sections.

Until within the last few years the existence of two genera having so very much in common as the camels and the llamas, and yet so completely isolated geographically, had not received any satisfactory explanation, for the old idea that they in some way "represented" each other in the two hemispheres of the world was a mere fancy without philosophical basis. The discoveries made mostly within the past ten years of a vast and previously unsuspected extinct fauna of the American continent of the Tertiary period, as interpreted by the able palæontologists Leidy, Cope, and Marsh, has thrown a flood of light upon the early history of this family, and upon its relations to other mammals. It is now known that llamas at one time were not confined to the part of the continent south of the Isthmus of Panama, as at the present day, for their remains have been abundantly found in the Pleistocene deposits of the region of the Rocky Mountains, and in Central America, some attaining a much larger size than those now existing. There have also been found in the same regions many camel-like animals exhibiting different generic modifications, and what is more interesting, a gradual series of changes, coinciding with the antiquity of the deposits in which they are found,

Fig. 1.—Llama (from an animal living in the Gardens of the Zoological Society of London).

have been traced from the thoroughly differentiated species of the modern epoch down through the Pliocene to the early Miocene beds, where, their characters having become by degrees more generalized, they have lost all that especially distinguishes them as *Camelidæ*, and are merged into forms common to the ancestral type of

all the other sections of the Artiodactyles. Hitherto none of these annectant forms have been found in any of the fossiliferous strata of the Old World; it may therefore be fairly surmised (according to the evidence at present before us) that America was the original home of the *Tylopoda*, and that the true camels have passed over into the Old World, probably by way of the north of Asia, where we have every reason to believe there was formerly a free communication between the continents, and then, gradually driven southward, perhaps by changes of climate, having become isolated, have undergone some further special modifications; while those members of the family that remained in their original birthplace have become, through causes not clearly understood, restricted solely to the southern or most distant part of the continent. There are few groups of mammals of which the palæontological history has been so satisfactorily demonstrated as the one of which we are treating.[1]

The special characters which the llamas and camels have in common, and the combination of which distinguishes them from the rest of the Artiodactyles, are as follows. The premaxillæ have the full number of incisor teeth in the young state, and the outermost is persistent through life, an isolated laniariform tooth. The canines are present in both jaws, and those of the mandible are differentiated from the long, procumbent, and spatulate incisors, being suberect and pointed. The crowns of the true molars belong to the crescentic or "selenodont" type, and are very long or "hypsodont;" but one or more of the anterior premolars is usually detached from the series, and of simple pointed form. The hinder part of the body is much contracted, and the femur long and vertically placed, so that the knee-joint is lower in position, and the thigh altogether more detached from the abdomen than in most quadrupedal mammals. The limbs are long, but with only two digits (the third and fourth) developed on each, no traces of any of the others being present. The trapezoid and magnum of the carpus, and the cuboid and navicular of the tarsus are distinct. The two metapodal bones of each limb are confluent for the greater part of their length, though separated for a considerable distance at the lower end. Their distal articular surfaces, instead of being pulley-like, with deep ridges and grooves, as in other Artiodactyles, are simple, rounded, and smooth. The proximal phalanges are expanded at their distal ends, and the wide, depressed middle phalanges are embedded in a broad cutaneous pad, forming the sole of the foot, on which the animal rests in walking instead of on the hoofs. The ungual phalanges are very small and nodular, not flattened on their inner or opposed surfaces, and not completely encased in hoofs, but bearing nails on their upper surface only. The cervical region is long and flexuous, and the vertebræ of which it is composed are remarkable for the position of the canal for the transmission of the vertebral artery, which does not perforate the transverse process, but passes obliquely through the anterior part of the pedicle of the arch (a condition only found in two other genera of mammals, *Macrauchenia* and *Myrmecophaga*). There are no horns or antlers. Though these animals ruminate, the stomach differs considerably in the details of its construction from that of the *Pecora*. The interior of the rumen or paunch has no villi on its surface, and there is no distinct psalterium or maniplics. Both first and second compartments are remarkable for the presence of a number of pouches or cells in their walls, with muscular septa, and a sphincter-like arrangement of their orifices, by which they can be shut off from the rest of the cavity, and into which the fluid portion only of the contents of the stomach is allowed to enter.[2] The placenta is diffuse as in the *Suina* and *Tragulina*, not cotyledonary as in the *Pecora*. Finally, they differ not only from other ungulates, but from all other mammals, in the fact that the red corpuscles of the blood, instead of being circular in outline, are oval as in the inferior vertebrated classes.

[1] See especially E. D. Cope, in Wheeler's *Report of the Survey West of the 100th Meridian*, iv. pt. 2, pp. 325–46, 1877.

[2] The stomach of the camel inhabiting the Arabian desert is commonly looked upon as a striking example of specialized structure, adapted or modified in direct accordance with a highly specialized mode of life; it is therefore very remarkable to find an organ exactly similar, except in some unessential details, in the llamas of the Peruvian Andes and the guanacos of the Pampas. No hypothesis except that of a common origin will satisfactorily account for this, and, granting that this view is correct, it becomes extremely interesting to find for how long a time two genera may be isolated and yet retain such close similarities in parts which in other groups appear readily subject to adaptive modifications.

The following characters apply especially to the llamas. Dentition of adults:—incisors $\frac{1}{3}$, canines $\frac{1}{1}$, premolars $\frac{2}{2}$, molars $\frac{3}{3}$; total 32. In the upper jaw there is a compressed, sharp, pointed laniariform incisor near the hinder edge of the premaxilla, followed in the male at least by a moderate-sized, pointed, curved true canine in the anterior part of the maxilla. The isolated canine-like premolar which follows in the camels is not present. The teeth of the molar series which are in contact with each other consist of two very small premolars (the first almost rudimentary) and three broad molars, constructed generally like those of *Camelus*. In the lower jaw, the three incisors are long, spatulate, and procumbent; the outer ones are the smallest. Next to these is a curved, suberect canine, followed after an interval by an isolated minute and often deciduous simple conical premolar; then a contiguous series of one premolar and three molars, which differ from those of *Camelus* in having a small accessory column at the anterior outer edge. The skull generally resembles that of *Camelus*, the relatively larger brain-cavity and orbits and less developed cranial ridges being due to its smaller size. The nasal bones are shorter and broader, and are joined by the premaxillæ. Vertebræ:—cervical 7, dorsal 12, lumbar 7, sacral 4, caudal 15 to 20. Ears rather long and pointed. No dorsal hump. Feet narrow, the toes being more separated than in the camels, each having a distinct plantar pad. Tail short. Hairy covering long and woolly. Size smaller and general form lighter than in the camels. At present and within historic times they are entirely confined to the western side and southernmost parts of South America, though fossil remains have been found in the caves of Brazil, in the pampas of the Argentine republic, and, as before mentioned, in Central and North America.

In essential structural characters, as well as in general appearance and habits, all the animals of this genus very closely resemble each other, so that the question as to whether they should be considered as belonging to one, two, or more species has been one which has led to a large amount of controversy among naturalists. The question has been much complicated by the circumstance of the great majority of individuals which have come under observation being either in a completely or partially domesticated state, and descended from ancestors which from time immemorial have been in like condition, one which always tends to produce a certain amount of variation from the original type. It has, however, lost much of its importance since the doctrine of the distinct origin of species has been generally abandoned. The four forms commonly distinguished by the inhabitants of South America are recognized by some naturalists as distinct species, and have had specific designations attached to them, though usually with expressions of doubt, and with great difficulties in defining their distinctive characteristics. These are—(1) the llama, *Auchenia glama*

Fig. 2.—Head of Vicugna (from an animal living in the Gardens of the Zoological Society of London).

(Linn.), or *Lama peruana* (Tiedemann); (2) the alpaca, *A. pacos* (Linn.); (3) the guanaco or huanaco, *A. huanacus* (Molina); and (4) the vicugna, *A. vicugna* (Molina), or *A. vicunna* (Cuv.). The first and second are only known in the domestic state, and are variable in size and color, being often white, black, or piebald.

The third and fourth are wild, and of a nearly uniform light-brown color, passing into white below. They certainly differ from each other, the vicugna being smaller, more slender in its proportions, and having a shorter head than the guanaco. It may therefore, according to the usual view of species, be considered distinct. It lives in herds on the bleak and elevated parts of the mountain range bordering the region of perpetual snow, amidst rocks and precipices, occurring in various suitable localities throughout Peru, in the southern part of Ecuador, and as far south as the middle of Bolivia. Its manners very much resemble those of the chamois of the European Alps; and it is as vigilant, wild, and timid. The wool is extremely delicate and soft, and highly valued for the purposes of weaving, but the quantity which each animal produces is not great.

The guanaco has an extensive geographical range, from the high lands of the Andean region of Ecuador and Peru to the open plains of Patagonia, and even the wooded islands of Tierra del Fuego. It constitutes the principal food of the Patagonian Indians, and its skin

Fig. 3.—Head of Guanaco (from an animal living in the Gardens of the Zoological Society of London).

is invaluable to them, as furnishing the material out of which their long robes are constructed. It is about the size of a European red deer, and is an elegant animal, being possessed of a long, slender, gracefully curved neck and fine legs. Dr. Cunningham,[1] speaking from observation on wild animals, says:—

"It is not easy to describe its general appearance, which combines some of the characters of a camel, a deer, and a goat. The body, deep at the breast but very small at the loins, is covered with long, soft, very fine hair, which on the upper parts is of a kind of fawn color, and beneath varies from a very pale yellow to the most beautiful snow-white. The head is provided with large ears, in general carried well back, and is covered with short grayish hair, which is darkest on the forehead. Occasionally the face is nearly black. As a rule, it lives in flocks of from half a dozen to several hundreds, but solitary individuals are now and then to be met with. They are very difficult to approach sufficiently near to admit of an easy shot, as they are extremely wary, but on being disturbed, canter off at a pace which soon puts a safe distance between them and the sportsman, even though he should be mounted. Despite their timidity, however, they are possessed of great curiosity, and will sometimes advance within a comparatively short distance of an unknown object, at which they will gaze fixedly till they take alarm, when they effect a speedy retreat. Their cry is very peculiar, being something between the belling of a deer and the neigh of a horse. It would be difficult to overestimate their numbers upon the Patagonian plains; for in whatever direction we walked we always came upon numbers of portions of their skeletons and detached bones."

Darwin, who has given a most interesting account of the habits of the guanaco in his *Naturalist's Voyage*, says that they readily take to the water, and were seen several times at Port Valdes swimming from island to island.

[1] *Natural History of the Strait of Magellan*, 1871.

The llama is only known as a domestic animal, and is chiefly met with in the southern part of Peru. Burmeister, the latest and a very competent writer on the subject,[2] says that he is perfectly satisfied that it is the descendant of the wild guanaco, an opinion opposed to that of Tschudi. It generally attains a larger size than the guanaco, and is usually white or spotted with brown or black, and sometimes altogether black. The earliest and often quoted account of this animal by Augustin de Zarate, treasurer-general of Peru in 1544, will bear repeating as an excellent summary of the general character and uses to which it was put by the Peruvians at the time of the Spanish conquest. He speaks of the llama as a sheep, observing, however, that it is camel-like in shape, though destitute of a hump:—

"In places where there is no snow, the natives want water, and to supply this they fill the skins of sheep with water and make other living sheep carry them, for, it must be remarked, these sheep of Peru are large enough to serve as beasts of burden. They can carry about one hundred pounds or more, and the Spaniards used to ride them, and they would go four or five leagues a day. When they are weary they lie down upon the ground, and as there are no means of making them get up, either by beating or assisting them, the load must of necessity be taken off. When there is a man on one of them, if the beast is tired and urged to go on, he turns his head round, and discharges his saliva, which has an unpleasant odor, into the rider's face. These animals are of great use and profit to their masters, for their wool is very good and fine, particularly that of the species called pacas, which have very long fleeces; and the expense of their food is trifling, as a handful of maize suffices them, and they can go four or five days without water. Their flesh is as good as that of the fat sheep of Castile. There are now public shambles for the sale of their flesh in all parts of Peru, which was not the case when the Spaniards came first; for when one Indian had killed a sheep his neighbors came and took what they wanted, and then another Indian killed a sheep in his turn."

The disagreeable habit here noticed of spitting in the face of persons whose presence is obnoxious is common to all the group, as may be daily witnessed in specimens in confinement in the menageries of Europe. One of the principal labors to which the llamas were subjected at the time of the Spanish conquest was that of bringing down ore from the mines in the mountains. Gregory de Bolivar estimated that in his day as many as three hundred thousand were employed in the transport of the produce of the mines of Potosi alone, but since the introduction of horses, mules, and donkeys the importance of the llama as a beast of burden has greatly diminished.

The alpaca is believed by most naturalists to be a variety of the vicugna; others have, however, identified it with the guanaco, and some consider it as a distinct species. It is usually found in a domesticated or semi-domesticated state, being kept in large flocks which graze on the level heights of the Andes of southern Peru and northern Bolivia at an elevation of from 14,000 to 16,000 feet above the sea-level, throughout the year. It is not used as a beast of burden like the llama, but is valued only for its wool, of which the Indian blankets and ponchas are made. Its color is usually dark brown or black. The characteristics of its wool, and the history of its introduction into British manufacturing industry, are described in the article Alpaca. (W. H. F.)

LLANDAFF, a city of Glamorgan, South Wales. See Cardiff, within which parliamentary borough it is almost entirely included.

LLANDUDNO, a watering-place in Carnarvonshire, North Wales, situated on the Irish Sea, and at the mouth of the Conway, in a finely sheltered bay, 50 miles west of Chester by rail. It lies between Great Orme's Head and Little Orme's Head, two lofty promontories which rise precipitously from the sea to the

[2] *Description Physique de la République Argentine*, vol. iii. p. 458, 1879.

height of several hundred feet. Round Great Orme's Head a public drive has been made, from which very picturesque views are obtained. The rock is greatly frequented by many varieties of sea birds, and is also the habitat of many rare plants. The old parish church of St. Tudno, situated on a cliff overlooking the sea, has been replaced by a later structure (St. George's), and the Church of Holy Trinity in the First Pointed style was erected in 1865. The chief attractions of the town are its picturesque and sheltered situation, and the fine facilities it affords for sea bathing. In the neighboring copper-mines various mineralogical specimens of interest have been found. On the summit of the head there are the remains of old circular buildings, some portions of an old fortress, and a rocking stone. The population of the urban sanitary district in 1871 was 2762, and in 1901 it was 9,307, but these figures do not represent its summer population, which is nearly twice as great.

LLANELLY, a market-town, parliamentary borough, and seaport town of Carmarthenshire, South Wales, is situated on a creek of Carmarthen Bay, on the river Lougher, and on several railway lines, 11 miles west of Swansea, and 225 west-north-west of London. It is a prosperous manufacturing town. The church of St. Elli or Llanelly is in the Early English style, with a square embattled tower. The other principal buildings are the town-hall and the athenæum. The town possesses extensive docks. It imports large quantities of copper ore, and carries on an export trade in its special manufactures. For the last five years the exports have averaged above £150,000 annually, and the imports £50,000. There are copper, silver, lead, and tin works, iron foundries, manufactures of pottery, chemical works, brick and tile works, flour-mills, and breweries; and in the vicinity there are extensive collieries. Llanelly is included in the Carmarthen district of parliamentary boroughs. The population of the urban sanitary district in 1871 was 14,973, which in 1901 had increased to 25,617.

LLANGOLLEN, a picturesque market-town of Denbighshire, North Wales, and a favorite summer resort, is beautifully situated in a fine vale surrounded by lofty mountains, on the right bank of the Dee, and on a branch line of the Great Western Railway, 9 miles south-west of Wrexham, and 22 south-west of Chester. The river is crossed by a peculiarly constructed bridge of five arches built in 1345. The church, dedicated to St. Collen, is a plain but ancient structure, partly in the Early English style. Opposite the town, on the summit of a conical hill, are the remains of a very ancient fortress, the Castell Dinas Brân. The beautiful abbey of Valle Crucis, in a neighboring dell, is one of the finest ecclesiastical ruins in Wales. Near it there is an ancient British monument, the "Pillar of Eliseg." The principal secular buildings of the town are the town-hall and the court-house. The industries include the manufacture of linen and wool, and in the vicinity there are collieries, lime-works, and iron-works. The population of the urban sanitary district in 1871 was 2798, and in 1901 it was 3,304.

LLORENTE, Juan Antonio (1756–1823), the historian of the Spanish Inquisition, was born March 30, 1756, at Rincon de Soto, near Calahorra, Aragon, studied at Tarragona and Saragossa, received (by dispensation) priest's orders in 1779, and became vicar-general to the bishop of Calahorra in 1782. In 1785 he became commissary of the Holy Office at Logroño, and in 1789 its general secretary at Madrid. In 1805 he obtained a canonry at Toledo, and in 1806–8 his *Noticias Historicas sobre las tres Provincias Vascondadas* appeared. In the crisis of 1808 Llorente identified himself with the Bonapartists, and from 1809 onwards he was engaged in superintending the execution of the decree of suppression of the monastic orders, and in examining the archives of the Inquisition for his *History*, a work which appeared in 1817–18 at Paris, where its author had been residing since the return of Ferdinand VII. to Madrid in 1814, under the title *Histoire critique de l'Inquisition d'Espagne, depuis l'époque de son établissement par Ferdinand V. jusqu' au règne de Ferdinand VII., tirée des pièces originales du Conseil de la Suprême et de celles des tribunaux subalternes du Saint Office.* Translated within a few years into German, English, Dutch, Italian, and Spanish, it attracted much attention throughout Europe, and involved its author in considerable persecution and hardship, which, on the publication of his *Portraits politiques des Papes* in 1822, culminated in a peremptory order (December, 1822) to quit France. His death, caused, or at least hastened, by the fatigues of the hasty journey to Spain, took place at Madrid on February 5, 1823. Both the personal character and the literary trustworthiness of Llorente have been very bitterly assailed; but, although he was very imperfectly equipped as an exact historian, there is no reason to doubt that he made an honest use of documents (now no longer extant) relating to the Inquisition, to which he had access at Madrid. An English (abridged) translation of the *History* appeared in 1826. A full list of the numerous writings of Llorente is given in the *Biographie Générale.*

LLOYD'S, an association of merchants, shipowners, underwriters, and ship and insurance brokers, having its headquarters in a suite of rooms in the north-east corner of the Royal Exchange, London. Originally a mere gathering of merchants for business or gossip in a coffee-house kept by one Edward Lloyd in Tower Street, London, the earliest notice of which occurs in the *London Gazette* of 18th February, 1688, this institution has gradually become one of the greatest and most perfect organizations in the world in connection with commerce. The establishment existed in Tower Street up to 1692, in which year it was removed by the enterprising proprietor to Lombard Street, in the very centre of that portion of the old city of London most frequented by merchants of the highest class. Shortly after this event Mr. Lloyd gave another proof of his enterprise and intelligence by the establishment of a weekly newspaper furnishing commercial and shipping news, in those days an undertaking of no small difficulty. This paper took the name of *Lloyd's News*, and, although its life was not a prolonged one, it was destined to be the precursor of the now ubiquitous *Lloyd's List*, the oldest existing paper, the *London Gazette* excepted, of the present day. In Lombard Street the business transacted at Lloyd's coffee-house steadily grew in extent and importance, but it does not appear that throughout the greater part of the 18th century the merchants and underwriters frequenting the rooms were bound together by any rules, or acted under any organization. By and by, however, the rapid increase of marine insurance business made a change of system and improved accommodation absolutely necessary, and accordingly, after finding a temporary resting-place in Pope's Head Alley, the underwriters and brokers finally settled down in the Royal Exchange in March, 1774. One of the first improvements in the mode of effecting marine insurance springing out of this new state of things was the introduction of a printed form of policy. Hitherto various forms had been in use; and, to avoid the numerous disputes consequent on a practice so loose and unsatisfactory, the committee of Lloyd's proposed a general form, which was finally adopted by the members on the 12th of January, 1779, and which remains in use, with only a few slight alterations, to this day. The two most important events in the history of Lloyd's during the present century are the reorganization of the association in 1811, and the passage of an Act in 1871 granting to Lloyd's all the rights and privileges of a corporation sanctioned by parliament. According to this Act of Incorporation, the three main objects for which the society exists are—first, the carrying out of the business of marine insurance; secondly, the protection of the interests of the members of the association; and thirdly, the collection, publication, and diffusion of intelligence and information with respect to shipping.

In the promotion of the last-named object, obviously the foundation upon which the entire superstructure rests, an intelligence department has been gradually developed which for wideness of range and efficient working has no parallel among private enterprises in any country.

The rooms at Lloyd's are available only to subscribers and members. The former pay an annual subscription of five guineas without entrance fee, but have no voice in the management of the institution. The latter consist of non-underwriting members, who pay an entrance fee of twelve guineas, and of underwriting members, who pay a fee of one hundred pounds. Underwriting members are also required to deposit securities to the value of £5000 to £10,000, according to circumstances, as a guarantee for their engagements. The management of the establishment is delegated by the members to certain of their number selected as a "committee for managing the affairs of Lloyd's." With this body lies the appointment of all the officials and agents of the institution, the daily routine of duty being entrusted to a secretary and a large staff of clerks and other assistants. The mode employed in effecting an insurance at Lloyd's is very simple. The business is done entirely by brokers, who write upon a slip of paper the name of the ship and shipmaster, the nature of the voyage, the subject to be insured, and the amount at which it is valued. If the risk is accepted, each underwriter subscribes his name and the amount he agrees to take or underwrite, the insurance being effected as soon as the total value is made up. The sum paid by the insured to the underwriters is denominated the premium, a tax upon the profits of the merchant which the progress of science, of the art of shipbuilding, and of navigation has in these days reduced to a very moderate figure.

(W. P. H.)

LOACH. The loaches (*Cobitidina*) are small fishes of the Carp family (*Cyprinidæ*), with a generally cylindrical body, with very small or without any scales, with six or more barbels round the mouth, with a short dorsal and anal fin, and with the pharyngeal teeth in a single series. The air-bladder is double, as in other carps, the two divisions lying side by side, or one behind the other; but it is always entirely or partially enclosed in a bony capsule formed by the anterior vertebræ. The largest of the ninety species known grow to a length of 10 or 12 inches, but the majority are of much smaller dimensions. They are found in Europe and Asia only. The typical species are partial to fast-running streams with stony bottoms; they abound in the waters draining the central Alps of Asia, and extend far towards the north of the Europo-Asiatic region. The tropical forms from the south of the Himalayas are not less common, and some of them have assumed a more compressed form of the body with a bright coloration. In Great Britain two species occur, viz., the common loach (*Nemachilus barbatulus*), and the more local *Cobitis tænia*, which is distinguished by a small spine below the eye. The former is esteemed as food in parts of the Continent where it occurs in sufficient abundance. See Ichthyology.

LOANDA, or in full São Paulo de Loanda, the capital of the Portuguese settlements in Western Africa, and the principal municipality of the Loanda district, one of the three into which Angola is divided, is situated on the mainland in 8° 48′ S. lat. and 13° 7′ E. long. The beautiful bay, protected from the surf by the long narrow island of pure sand from which the town takes its name, is backed by a line of low sandy cliff which at its southern end sweeps out with a sharp curve and terminates in the bold point crowned by Fort San Miguel. A good part of the town lies on the shore, but the more important buildings—the Government offices, the governor's residence, the palace of the bishop of Angola, and the admirable hospital—are situated on the higher grounds. Most of the European houses are large stone buildings of one story with red tile roofs. The streets, formerly full of loose fine sand, have in many cases been paved. The great defect of the situation is the want of water, which had to be brought for the most part in little boats from the Bengo and the Dande; but the Portuguese government signed a contract in November, 1877, by which a canal 43 miles long was to be constructed, at a cost of 6,000,000 francs, from Tandabondo (a point 37 miles from the mouth of the Bengo) to the city. Loanda is a busy place; the shops are well supplied with European goods, and large native markets are held in various parts of the town. While the slave trade to Brazil was still in full prosperity, the traffic of the port was of no small account; and after a period of great depression it is now developing in more legitimate directions. There is a regular service of steamers from Lisbon and Liverpool, and in 1877 746 vessels entered and 693 cleared. The population is from 10,000 to 12,000 (Lux gives 18,000 to 20,000), about a third being whites. From 1641 to 1648 Loanda was occupied by the Dutch.

See J. J. Monteiro, *Angola and the River Congo*, London, 1875; and Lux, *Von Loanda nach Kimbundu*, Vienna, 1880.

LOANGO, in the wider signification of the name, is a region on the west coast of southern Africa, which extends from the mouth of the Congo (Zaire) river in 6° S. lat. northwards through about two degrees, with no very definite limit in this direction, unless we adopt the Numbi river which falls into Chilunga Bay in 4° 9′ S. lat., and was formerly considered the northern boundary of the Loango kingdom. In a narrower sense it is the country bounded on the S. by the Luemma, and on the N. by the Kuilu,—the district between the Luemma and the Chiloango being known as Chiloango or Little Loango, that between the Chiloango and the Congo as Kakongo and Angoy, and that to the north of the Kuilu as Chilunga. The whole country between 6° and 4° may be described as the lowland portion of the seaward versant of the Serra do Crystal or Serra Complida, a range running almost parallel with the coast, from which its spurs and underfalls are distant only 30 or 40 miles. It has an irregularly undulating or hilly surface, slowly rising in somewhat indefinite terraces, and is traversed from north-east to south-west by a number of considerable streams flowing in well-marked valleys. The coast-line in some stretches is low and swampy, while in others, as along Loango and Kabinda Bays, it presents a series of cliffs 40 to 50 feet high. Behind the region of alluvial deposits which prevails for some distance inland there is a broken belt of Tertiary rocks; but these soon give place to laterite, and beyond the laterite lie the micaschists, talcs, and gneiss of which the mountains are composed. Of the Loango rivers the best explored is the Kuilu or Quillu. At its mouth, in 4° 29′ S. lat., it is a noble stream 1100 feet wide, but the bar has hitherto proved an insuperable obstacle to the entrance of sea-going ships; near the Mayombe factory, which may be reached in fifteen hours from the coast, it begins to take the character of a mountain stream. Its principal affluent is the Nanga. Farther south are the Songolo and the Luemma. Of greater importance as a navigable route towards the interior is the Chiloango or Loango Luse (sometimes erroneously called the Kakongo), which disembogues in 5° 12′ S. lat. and 12° 5′ E. long., and is formed about 15 miles inland by the junction of the Loango and the Lukula, of which the one separates Loango proper from the Osobo country and the other the Osobo country from Kakongo.

Though a large proportion of the Loango coast region is occupied by primeval forest, with trees rising to a height of 150 and 200 feet, there is considerable variety of scenery —open lagoons, mangrove swamps, scattered clusters of trees, park-like reaches, dense walls of tangled underwood along the rivers, prairies of tall grass through which no pathway can be driven, and patches of cultivation. Among the more characteristic forms of vegetation are baobabs, silk-cotton trees, screw-pines, and palms—especially *Hyphæne guineensis* (a palm-fan), *Raphia* (the wine-palm), and *Elæis guineensis* (the oil-palm). Anonaceous plants (notably *Anona senegalensis*) and the *pallabanda*, an olive-myrtle-like

tree, are common in the prairies; the papyrus shoots up to a height of 20 feet along the rivers (particnlarly the Luemma); the banks are fringed by the cottony *Hibiscus tiliaceus*, ipomæas, and fragrant jasmines; and the thickets are bound together in one inextricable mass by lianas of many kinds. Among the fruit trees are the mango and the papaw; the orange has been successfully introduced at Vista and Kabinda; and the lemon continues to flourish well up the country. Negro-pepper (a variety of capsicum) and ginger grow wild; the natives, in addition to manioc (their staple sustenance) and bananas, cultivate ground-nuts and tobacco; and the planters have European vegetables in their gardens.

The crocodile, the hippopotamus, and several kinds of apes—including the chimpanzee and the rare gorilla—are the most noteworthy larger animals; the birds are various and beantiful—gray parrots, shrikes, fly-catchers, rhinoceros birds, weaver birds (often in large colonies on the palm-trees), ice birds, from the *Cecyle Sharpii* to the dwarfish *Alcedo cristata*, butterfly-finches, and helmet-birds (*Turacus giganteus*), not to mention doves, snipes, and other more familiar types. Snakes are extremely common—*Caucus rhombeatus*, *Atractaspis irregularis*, *Dendraspis Jamesonii*, *Dasypeltis palmarum*, etc., but they give comparatively little trouble. The curious climbing-fish, which frequents the mangroves, the *Pteropterus* or lung-fish, which lies in the mud in a state of lethargy during the dry season, the strange and poisonous *Tetrodon guttifer*, and the herring-like *Pellona africana*, often caught in great shoals—are the more remarkable of the fishes. Oysters are got in abundance from the lagoons, and the Portuguese fatten the huge *Cardisoma armatum* or heart-crab for table. Fireflies and unfortunately also mosquitoes and sandflies are among the most familiar forms of insect life; the bird spider among the rarer. A kind of ant builds very striking pent-house or umbrella-shaped nests rising on the tree trunks one above the other like the roofs of a Chinese pagoda.

Well-built and tall (average height of the men 5·5 feet, of the women 5·2), strongly dolichocephalous and very thick of skull, never black, but of various shades of warm brown with the faintest suggestion of purple, the Bafiote (as the natives of the Loango coast call themselves) are on the whole very favorable specimens of the Negro stock to which they belong. Their black curly hair never becomes white with age, and gray only in the case of very old people. Baldness is quite unknown, and many of the men wear beards. Physical deformity is extremely rare. Like the west-coast negroes in general the Bafiote have a ghastly and grotesque belief in fetiches and witchcraft; and their gangas or priests employ the cassa (nkassa) ordeal with such recklessness that for every grown-up person who dies a natural death three or four, it is estimated, perish by this judgment of the invisible powers. A custom which readily catches the eye of the foreigner is that of setting their marriageable maidens forth to view in a little bower specially erected in front of the parents' dwelling—their skins stained red with a peculiar powder. Near Chinchoxo there is a curious tribe, the Mavumbu or Umwambu, known to Europeans as Black Jews on account of their strikingly Semitic features. The coast people proper or Bavilli look down on their more inland neighbors as less civilized; and these in their turn pay the same compliment to those beyond,—the Bayombe and Bayaka, who occupy the mountainous woodland on the borders of Loango, being reckoned as genuine savages.

The people are scattered throughout the country in small villages; Nkondo, probably the largest, contains only 350 to 400 huts, though it is the seat of one of the most influential "princes." There is no town or village of Loango,—the place of that name on Loango Bay being a mere group of factories. Buri, Boari, or Boali, was the name of the former capital; Loangiri or Loangole (visited in 1873 by Bastian) was the burial-place of the ancient kings; and Lubu, which is still neutral in war, is that of the "princes." At one time included in the great Congo kingdom, Loango became independent about the close of the 16th century, and was still of considerable importance in the days of Abbé Proyart (1750), though Kakongo and other districts were practically independent. At present there is no central authority in the country; the petty local chiefs are local chiefs and nothing more; but the members of the blood royal are still honored with special privileges, a large number of nominal titles remain in use, and a common tradition of greatness gives a sort of cohesion to the political conglomerate.

The slave-trade was longer maintained in Loango than anywhere else on the West African seaboard; and since its extirpation palm oil and india-rubber have been the main objects of commerce. Perfect freedom of trade prevails; and there are Dutch, Portuguese, German, French, and English factories on the coast and up the rivers. The Portuguese have made considerable efforts to secure territorial supremacy; but they have hitherto failed, partly owing to direct French opposition, partly to the state of the country.

The following are the principal stations of European trade:—Banana at the mouth of the Congo, the central post of the Rotterdam African Trading Company, whose comptoirs are scattered along a vast extent of the west coast; Muanda, with one of the best of the native villages; Vista; Kabinda, the natives of which are known as far south as Mossamedes for their enterprise and skill as carpenters, tailors, etc.; Landana, the seat of Dutch, French, and Portuguese factories, and of a French mission from the Gaboon; and Chincho or Tchinchotcho (5° 9′ 14″ S. lat., 12° 3′ 45″ E. long.) the post occupied by the German Exploring Expedition in 1873–76.

See, besides Merolla and Battel (Pinkerton, vol. ii.), Proyart, *Histoire de Loango*, Paris, 1766 (also in Pinkerton); Degrandpré, *Reise nach der westlichen Küste von Afrika*, Weimar, 1801; Bastian, *Die deutsche Expedition an der Loango-Küste*, Jena, 1874–75; and *Die Loango-Expedition*, by Dr. Paul Güssfeldt (1879), Julius Falkenstein (1879), and Pechuel-Loesche (1882)

LOBELIA, L., the typical genus of the tribe *Lobeliæ*, of the order *Campanulaceæ*, named after Matthias de Lobel,[1] a native of Lille, botanist and physician to James I. It numbers about two hundred species, natives of nearly all the temperate and warmer regions of the world, excepting central and eastern Europe as well as western Asia. For the sections into which the genus is divided, see *Genera Plantarum*, by Bentham and Hooker, vol. ii. p. 551; and for species, De C., *Prod.*, vii. p. 357. Two species are British, *L. Dortmanna*, L., named after Dortmann, a Dutch druggist, which occurs in gravelly mountain lakes; and *L. urens*, L., which is only found on heaths, etc., near Axminster (see Baxter's *Brit. Gen.*, No. 79). The genus is distinguished from *Campanula* by the irregular corolla and completely united anthers, and by the excessive acridity of the milky juice. The species earliest described and figured appears to be *L. cardinalis*, L., under the name *Trachelium americanum sive cardinalis planta*, "the rich crimson cardinal's flower;" Parkinson (*Paradisus*, 1629, p. 356) says, "it groweth nere the riuer of Canada, where the French plantation in America is seated;" De Candolle records it from New England to Carolina (*Prod.*, vii. 382). This species, as well as several others, are in cultivation as ornamental garden plants, *e. g.*, the dwarf blue, *E. Erinus*, L., from the Cape, which, with its varieties, forms a familiar bedding plant. *L. splendens*, Willd., and *L. fulgens*, Willd., growing from 2 to 4 feet high, from Mexico, have scarlet flowers; while *L. amœna*, Mich., from North America, as well as *L. syphilitica*, L., and its hybrids, from Virginia, have blue flowers. The last-named was introduced in 1665, according to Paxton (*Bot. Dict.*, p. 340), but is not mentioned by Parkinson. Certain species of lobelia are used medicinally, the chief being *L. inflata*, L., a native of north-eastern America, called "Indian tobacco," as its effects are very similar to those of tobacco; for its localities, etc., see Pickering, *Chron. Hist. of Pl.*, p. 1015. It is expectorant and diaphoretic in small doses, but in full medicinal doses is nauseating and emetic. It is used for spasmodic asthma, and as an adjunct to diuretics. See Bentley and Trimen's *Med. Pl.*, No. 162; *Pharmacographia*, p. 357; and Pereira's *Mat. Med.*, vol. ii. pt. ii. p. 8. For active principles, see *Pharm. Journ.*, vol. x. pp. 270, 456. Another medicinal species is *L. syphilitica*, L., the blue cardinal, of which the root is used by the North American Indians for the purpose implied in the specific name. The value, however, is said to have no foundation in fact (Pearson, *Obs. on var. Art. of Mat. Med.*, p. 70), but see *Amer. Dispens.*, p. 494. A third species is *L. decurrens*, Cav., from near Arequipa in Peru, where the Indians use it as an emetic (*Pharm. Journ.* [1], vol. xiii. p. 14).

LOBO, Ieronimo (1593–1678), a Jesuit missionary, was born in Lisbon in 1593, and entered the Order of Jesus at the age of sixteen. In 1621 he was ordered to repair as a missionary to India, and in 1622 he arrived

[1] [A Fleming (1538–1616), who did his best work in London and Denmark.—Am. Ed.]

at Goa. With the intention of proceeding to Abyssinia as a missionary, he left India in 1624, but after disembarking on the coast of Mombas, and attempting to reach his destination by land, through the Galla country, was forced to return. Repeating the attempt in the ensuing year, in concert with Mendez, the newly-appointed patriarch of Ethiopia, and eight missionaries, Lobo landed on the coast of the Red Sea, and settled down in Abyssinia as superintendent of the missions in the state of Tigre, travelling about a good deal over the country, and thus obtaining much valuable information on its geography and people. He remained at his post for some years, until death deprived the Catholics of their protector, the emperor Segued. Forced by persecution to leave the kingdom, in 1634 Lobo fell, along with his companions, into the hands of the Turks at Massowah, and was sent by them to India to procure a ransom for his imprisoned fellow-missionaries. This object he gained, and at the same time he endeavored, though without avail, to persuade the Portuguese viceroy to send an armament against Abyssinia. Intent upon accomplishing this cherished project, he embarked for Portugal, and after he had been shipwrecked on the coast of Natal, and captured by pirates, arrived at Lisbon. Neither at this city, however, nor at Madrid and Rome, was any countenance given to Lobo's plan for Christianizing Abyssinia by the aid of arms. He accordingly returned to India in 1640, and was elected rector, and afterwards provincial, of the Jesuits at Goa. After some years he returned to his native city, and died there January 29, 1678.

Lobo wrote an account of his travels in Portuguese, which appears never to have been printed, but is deposited in the monastery of St. Roque, Lisbon. Balthezar Telles made large use of the information therein in his *Historia Geral da Etiopia Alta* (Coimbra, 1660), which is often erroneously attributed to Lobo (see Machado's *Bibliotheca Lusitana*). Lobo's own narrative was translated from a MS. copy into French, under the title of *Voyage Historique de Abissinie*, by the Abbé Legrand, Paris, 1728. In 1669 a translation by Sir Peter Wyche of several passages from a MS. account of Lobo's travels was published by the Royal Society, and this was translated into Thenevot's *Relation des Voyages* in 1673. An English abridgment of Legrand's edition by Dr. Johnson was published in 1735, and reprinted in 1789. In a *Mémoire justicatif en rehabilitation des Pierre Paez et Jerome Lobo*, Dr. C. T. Beke maintains the accuracy of Lobo's statements as to the source of the Abai branch of the Nile against Bruce.

LOBSTER. See CRUSTACEA, and FISHERIES, vol. ix. p. 231.

LOCK—not being a canal lock—means the fastening of a door, or box, or drawer, which requires a key, or else some secret contrivance or manipulation, to open it. It is generally fixed to the door, but it may also be loose, and then it is called a padlock, which is internally like other locks, but externally has a half link or *bow* turning on a hinge at one end, while the other, after being put through a chain or staple on the door, enters the lock and is fastened by the bolt therein.

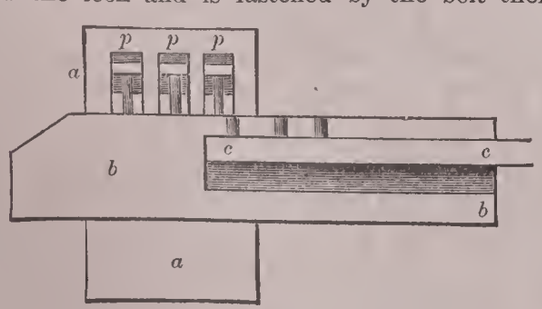

Fig. 1.

The bolt may be moved by the key, or may close by a spring, but requires a key to open it, as in the case of handcuffs, which are a pair of padlocks of this kind united by a short chain. A common door lock also comprises a spring latch which opens by a handle, and sometimes a small bolt held by friction either shut or open, which is moved by a smaller handle inside the room only; but neither of these is the lock proper, any more than a hook or a button, or a common lifting latch. Therefore, omitting them, a lock is as defined above.

The earliest lock of which the construction is known is the Egyptian, which was used four thousand years ago. In fig. 1, *aa* is the body of the lock, *bb* the bolt, and *cc* the key. The three pins, *p*, *p*, *p* drop into three holes in the bolt when it is pushed in, and so hold it fast; and they are raised again by putting in the key through the large hole in the bolt and raising it a little, so that the pins in the key push the locking pins up out of the way of the bolt. The security of this is very small, as it is easy enough to find the places of the pins by pushing in a bit of wood covered with clay or tallow, on which the holes will mark themselves; and the depth can easily be got by trial.

Mr. Chubb, the well-known lock-maker, used to show a wooden Chinese lock very superior to the Egyptian, and, in fact, founded on exactly the same principle as the Bramah lock, which long enjoyed the reputation of being the most secure lock ever invented; for it has sliders or tumblers of different lengths, and cannot be opened unless they are all raised to the proper heights, and no higher. Until about a century ago no lock so good as this was known in England. The locks then in use (fig. 2) were nothing better than a mere bolt, held in its place, either shut or open, by a spring *b*, which pressed it down, and so held it at either one end or the other of the convex notch *aa;* and the only impediment to opening it was the wards which the key had to pass before it could turn in the keyhole. But it was always possible to find the shape of the wards by merely putting in a blank key covered with wax, and pressing it against them; and when this had been done, it was by no means necessary to cut out the key into the complicated form of the wards (such as fig. 3), because no part of that key

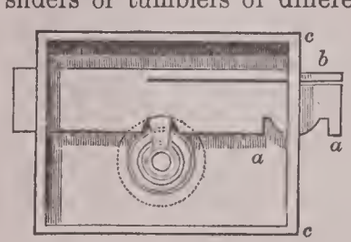

Fig. 2.

Fig. 3.

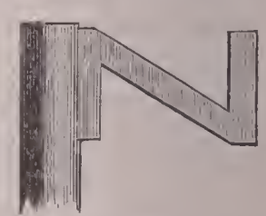

Fig. 4.

does any work except the edge *bc* farthest from the pipe *a;* and so a key of the form fig. 4 will do just as well; and a small collection of skeleton keys, as they are called, of a few different patterns, were all the stock in trade that a lock-picker required.

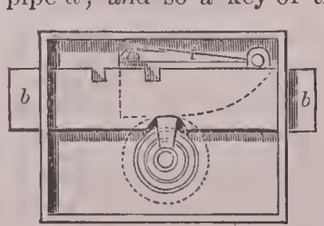

Fig. 5.

The common single-tumbler lock (fig. 5) was rather better than this, as it requires two operations instead of one to open it. The tumbler *at* turns on a pivot at *t*, and has a square pin at *a*, which drops into a notch in the bolt *bb*, when it is either quite open or quite shut, and the tumbler must be lifted by the key before the bolt can be moved again. But this also is very easy, unless the lock is so made that the tumbler will go into another notch in the bolt if it is lifted too high, as in the lock

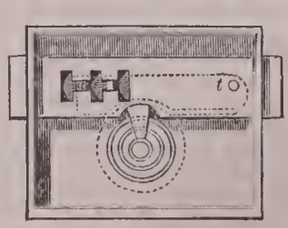

Fig. 6.

we shall now describe, which was the foundation of all the modern improvements in lock-making.

Barron's Lock.—This was the first lock with several tumblers. It was patented in 1778. Fig. 6 is a front view, and fig. 7 a horizontal section. First consider it

Fig. 7.

with reference to one tumbler *at* only. Unless the square pin *a* is lifted by the key to the proper height, and no higher, the bolt cannot move, and that alone adds very considerably to the difficulty of picking, except by a method not discovered for many years after. But Barron added another tumbler, and unless both were raised at once to the proper height, and no higher, the lock could not be opened. The face, or working edge, of the key of a many-tumblered lock assumes this form (fig. 8), the steps corresponding to the different heights to which the tumblers have to be raised, and one of them acting on the bolt, and they may have a much wider range of difference than in this figure. The key here drawn is also one with the

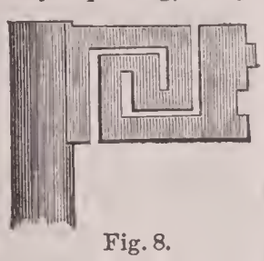

Fig. 8.

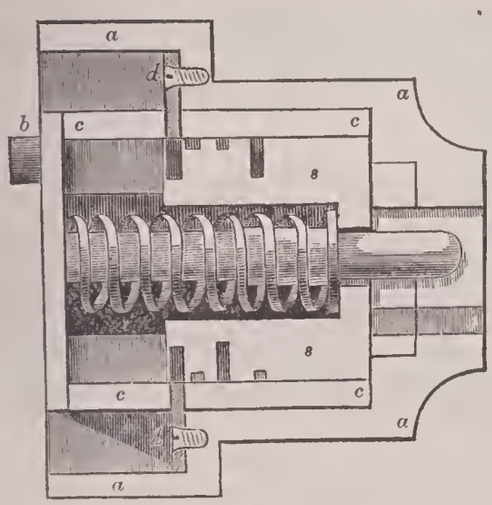

Fig. 9.

wards of such a shape that no skeleton except itself can pass them. The form, however, can be got in the

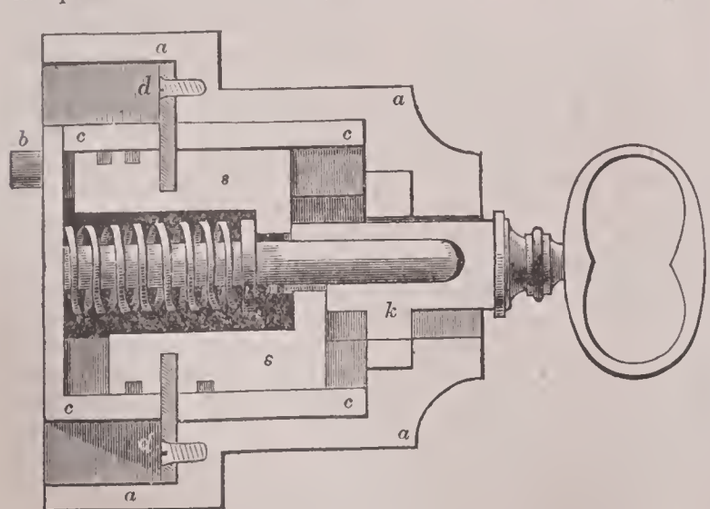

Fig. 10.

usual way by a wax impression; and as it weakens the key very much, and is expensive to cut, it is not often used.

Bramah's Lock.—The next lock of any importance was the celebrated one patented ten years after Barron's, by Joseph Bramah (see BRAMAH). In figs. 9 and 10 *aaaa* is the outer barrel of the lock, which is screwed to, or cast with, the plate; *cccc* is a cylinder, or inner barrel, turning within the other. It is shown separately at fig. 11; and fig. 12 is a cross section of it, the

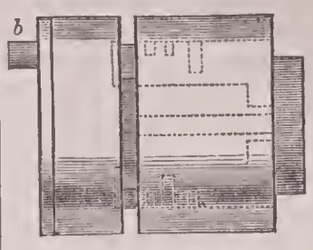

Fig. 11.

Fig. 12.

black ring being the keyhole, and the light spot in the middle the drill-pin, which goes into the key. The short pin *b* in figs. 9, 10, 11 is set in the end of the cylinder, near its edge; and, when the cylinder turns round, that pin shoots or draws the bolt, by acting in a slit of the form shown in fig. 13. The security of the lock depends upon a number of slides, *s*, *s*, of which the shape is shown in fig. 14, and the cross section in fig. 12. They are made of plates of steel doubled, and sprung open a little, so as to make them move with a little friction in the slits of the cylinder or revolving barrel in which they lie, and are pressed up against the cap of the lock by a spiral spring. They are shown so pressed up in fig. 9, and pressed down by the key in fig. 10. There is a deep groove cut round the barrel, and in each of the sliders there is a deep notch which can be pushed down to that place in the barrel by a key slit to the proper depth; and it is evident that when all the sliders are pushed down to that position the barrel will present the appearance of having no sliders on it. A steel plate (fig. 15), made in two pieces in order to get it on, embraces the barrel at the place where the groove is, having notches in it corresponding to the sliders, and is fixed to the body of the lock by two screws marked *d*, *d* in figs. 9, 10, and 15. When the sliders are pushed up by the spring they fill the notches in the plate, and prevent the barrel from turning; but when they are pushed down by the key the notches in the sliders all lie in the plane of the plate, and so the barrel can turn with the key, and the pin *b* in the end of it drives the bolt as before described.

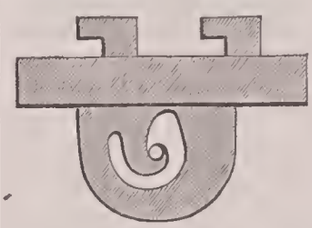

Fig. 13.

The key has a bit, *k*, sticking out from the pipe, the use of which is to fix the depth to which it is to be pushed in, and then, as the bit slips under the cap of the lock, it keeps the key at the same depth while it is being turned.

This was the construction of the lock for a good many years, and Bramah pronounced it in that state "not to be within the range of art to produce a key, or other instrument, by which a lock on this principle can be opened." It was found, however, long before the defeat of the improved challenge Bramah lock by Mr. Hobbs in 1851, that the inventor had made the common mistake of pronouncing that to be impossible which he only did not see how to do himself. As it has been generally supposed that what is called the tentative method of lock-picking was unknown in England before it came over from America in the year of the Exhibition of 1851, we must remind our readers that it was described in the 7th edition of this work fifty years ago, though the lock-picking fraternity were not of sufficiently literary habits to make themselves acquainted with it. Mr. Hobbs, it is true, carried the process further than had been supposed possible before; but

all the Barron and Chubb and other many-tumblered locks, which were supposed impregnable, might long ago have been opened by anybody who had paid attention to the method by which the Bramah locks were known to have been picked some seventy years ago, before the introduction of the false notches designed in 1817 by Mr. Russell, then one of Mr. Bramah's workmen. If you apply backward pressure to the bolt of a tumbler lock when locked, or twisting pressure to the barrel of a Bramah lock, first pressing down the spiral spring, there will be a greater pressure felt against some of the tumblers or sliders than against others, in consequence of inevitable inequalities of workmanship; and if you keep the pressure up, and gently move any of the tumblers or sliders on which the pressure is felt, you will at last get it to some point where it feels loose. That may or may not be the exact place to which the key ought to lift it; but as soon as you feel it loose leave it alone, it will not fall again, as the friction is sufficient to prevent it; and, if necessary, you may fix it there by a proper instrument, or measure the depth and keep the measure till you begin again. Then try another tumbler which feels tight, and raise it till it also feels loose. And if you go on in that way, always leaving the loose tumblers alone, and raising the one which feels tight, they will at last all be got into the position of complete freedom, *i. e.*, to the place where the stump of the bolt can pass them. The operation is just the same in principle in the Bramah lock and in tumbler locks; only, as all the sliders are acted on by one spring in the Bramah as now made, you need only just push down that spring, and hold it there, and then the sliders may be moved freely either way by means of a hook or a small pair of self-acting forceps to pull them up if they accidentally get pushed too far. At first each slider had a separate spring.

But if the sliders have some false notches in them not so deep as the true ones (see fig. 14), and the corners of the notches in the plate *dd* are cut out a little (as in fig. 15), then you might by trial get all the sliders into such a position that the barrel could turn a very little, but no more; and when it is turned that little, you cannot push the sliders in any further, and so (as was long supposed) the tentative process is defeated; and undoubtedly it is made much more troublesome, but it only requires more time and patience. You can still feel that the pressure is greater against some one or more of the tumblers or sliders than against others, and wherever that is the case, you know that it must be a false notch, and not the true one, for a true one gives no pressure at all. Proceeding in this way, Mr. Hobbs opened the challenge lock with eighteen sliders, or guards, which had hung in Messrs. Bramah's window for many years, in nineteen hours, and would have done it sooner, but that one of his instruments broke in the lock. He afterwards repeated the operation three times within the hour, in the presence of the arbitrators; and a more recent one with eight sliders he opened in four minutes, by means of an instrument which is equivalent to a Bramah key with adjustable slits, which are set to the sliders as the operation of feeling them and getting their depths goes on. It is, moreover, to be remembered that thieves do not always confine themselves to the conditions of a challenge, in which force and injury to the lock are of course prohibited; and, if a lock can be easily opened by tearing out its entrails, it is of very little use to say that it would have defied all the arts of polite lock-picking. In this respect the Bramah lock is singularly deficient; for if the exposed cap or nozzle of the keyhole is cut off, as it easily may be, or if the hole is widened out by a centre-bit, the sliders can all be pulled out, and there is an end of the lock.

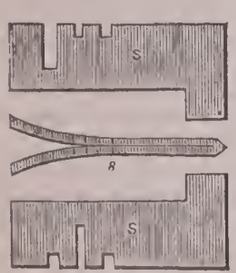

Fig. 14.

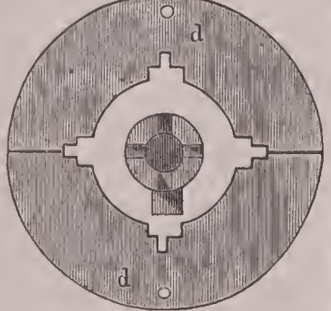

Fig. 15.

Inside and Outside Locks.—Locks for drawers, closets, iron chests, and the like are only required to lock on one side, and their keys are therefore generally made with a pipe, which slips on to a pin in the lock called the drill-pin, and turns on it. Doors which have to be locked sometimes on one side and sometimes on the other cannot have their keys made in this way; the key is solid, and its plug or stem, being thicker than the flat part or web, acts as an axis fitting into the upper part of the keyhole, though that hole does not completely enclose it. All keys for these inside and outside locks must be symmetrical or alike on each side of a line through their middle, in order to fit the lock either way, which limits the variety of the tumblers in the case of many-tumblered locks. A Bramah lock, to open on both sides, must be made double, with one set of sliders to push in from one side of the door, and the other set from the other side; and, consequently, they are very seldom used for this purpose. It may be convenient to observe that when we use the term Bramah lock we mean a lock of that construction; for, the patent having long ago expired, such locks may be made by anybody, only Bramah's name must not be used. Messrs. Mordan's locks are the same as Bramah's, except that they make the number of sliders odd, while Messrs. Bramah make it even.

Letter Locks.—At one time it used to be supposed that locks which could only be opened by setting a number of rings or disks to a particular combination of letters could not possibly be opened by anybody who was not in possession of the secret; and hence they were also called puzzle-locks. At first they were made with a fixed combination, which could not be changed. Afterwards the rings were made double, the inner one having the notch in it which the bolt had to pass, and the outer one capable of being fitted on to the inner in any position, by unscrewing some part of the lock, so that you might set them to any combination desired. This was the first instance of a changeable lock, of which we shall have more to say further on. But it was afterwards found that these puzzle-locks have just the same vulnerable point as all our locks had until lately, viz., that the pressure of the bolt can be felt on some of the rings more than on the others; and Mr. Hobbs says emphatically, in the *Rudimentary Treatise on Locks*, "wherever that is the case, that lock can be picked." Apart from this defect, these locks have very much gone out of use on account of their being troublesome to handle, and perhaps also from the risk of forgetting the combination to which the lock was set last, if it has been left for some time; and therefore we do not think it necessary to go farther into the details of their construction.

Chubb's Locks.—Of the multitude of locks which have been made on the many-tumbler principle invented by Barron, none enjoyed so much celebrity before Hobbs's as Chubb's. This was partly due to superior workmanship and use of more tumblers than usual, and perhaps still more to the inventor having had the good fortune to hit upon the name "detector" for a certain part of the machinery, which, besides adding to the security against any mode of picking then known, also captivated the public with the idea of discovering if anybody had been tampering with the lock, though the operator might depart in ignorance that he had left any trace of his attempt behind him. It is remarkable that the detector was not even then a new invention; for a lock exactly the same in principle, but slightly different in arrangement, had been

previously made by a Mr. Ruxton, and is described in Price's treatise on *Locks and Keys*, etc., 1856. In the same way false notches were used in Strutt's tumbler lock above thirty years before they were reinvented, by Chubb and others, with the idea of defeating the tentative method of picking by them. In all lever or tumbler locks there is a square pin B, called the stump, riveted to the bolt, which has to clear the passage in the tumblers called the gating. The original form of Chubb's detector is shown in fig. 16 by the lever DT, which turns on a pin in the middle, and is acted upon at its end T by a spring S, which will evidently allow some play to the lever on either side of the corner X, but the moment it is pushed past that point the spring will carry it further in the same direction, like what is called in clock-work a jumper. In its proper position that end always remains above the turning point; but, if any one of the tumblers is raised too high, the other end D of the detector, which reaches over all the tumblers, is lifted so far that the end T is sent down below the corner, and the tooth T then falls into a notch in the bolt, and so prevents it from being drawn back, even though all the tumblers are raised properly by the right key, which at once reveals that somebody has been trying to pick the lock. The way to open it then is to turn the key the other way, as if to overlock the bolt; you observe a short piece of gating near the end of the tumblers, to allow the bolt to advance just far enough to push the tooth of the detector up again by

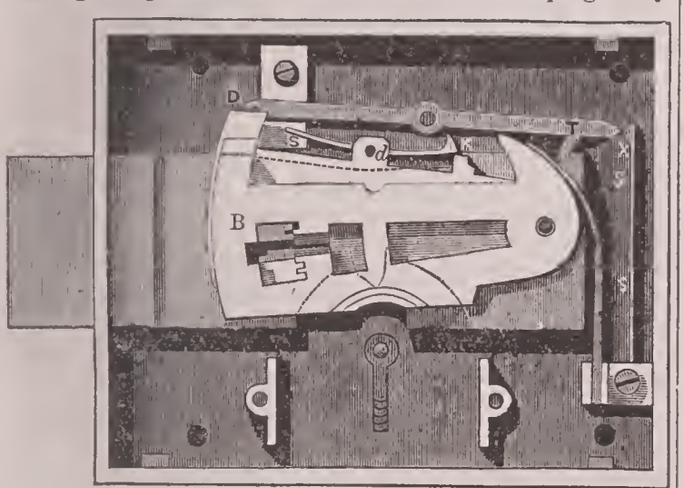

Fig. 16.

means of its inclination there, and then the lock can be opened as usual. In some more recent locks the tumbler is made in another form. The back tumbler, or the one which has to be raised highest, has a pin *d* reaching over all the others, and if any of them are overlifted that back tumbler is also, and then a square corner *k* in it gets past the end of the detector spring *ks*, and is held up. It is set right by overlocking the bolt as before, the bolt itself raising the end *k* of the spring, and letting the tumbler fall. This form of detector is, however, inferior to the other, as it informs the picker what he has done, by the back tumbler itself being held up, which he can feel directly.

But since Mr. Hobbs's mode of picking locks became known all these detectors have become useless. Some persons have even gone so far as to say that the detector may be made a guide to picking. Whether this be so or not, the detector does not act unless some of the tumblers are raised too high, which they never are by a skilful operator on this plan, nor does it act (even if thrown by accident) against picking backwards, or feeling the way to shoot the bolt a little further, as if to free the detector; and in this way the measure of the key can be taken without any hindrance from the detector. Before 1851 tumbler locks were seldom made with false notches, except Strutt's, in which the tumblers were in the form of quadrants, with a very large angular motion, and a number of short or false notches and one deep one. But after that year Chubb and other makers of tumbler locks adopted false notches, together with revolving curtains, which cover the straight part of the keyhole as soon as the key is turned, and barrels going down from the back of the curtain to prevent a false key or pick from turning without turning the curtain; other obstacles were added, of which the object is in all cases to prevent the maintaining of pressure of the stump upon the tumblers at the same time that the tumblers themselves are moved, or, as Mr. Hobbs called it, tickled, by some other instrument. These provisions undoubtedly make the locks more difficult to pick, but it is by no means safe to assume that a lock will never be picked merely because it would take a first-rate hand a long time to do it or gradually make his key.

Hobbs's Lock.—The invention which most directly meets the defect of all previous locks is Mr. Hobbs's "movable stump," which is not riveted into the bolt as usual, but is set on the end *b* of a bent lever *abc* (fig. 17) which lies in a hollow of the bolt A behind it, turning on a pivot in the bolt itself, and kept steady by a small friction-spring *e*. The stump comes through a hole in the bolt large enough to let it have a little play; and the long end *a* of the lever stands just above the edge of a square pin *d*, which is fixed in the back plate of the lock. When the lock is locked, if you push the bolt back, you produce no sensible pressure on the tumblers, but only just enough to turn this protector lever, as Mr. Hobbs calls it, on its pivot *c*, and so bring down its end *a* in front of the square pin, and then the bolt can no more be pushed back than when held by Chubb's detector. The protector is set free again by merely pushing the bolt forward with the key, without reference to the tumblers. It was found, however, that in this state the protector could be prevented from acting by a method used by the inventor himself for another purpose, viz., pushing a piece of watch-spring through the keyhole, and up behind the bolt, so as to reach the protector at *a*, and keep it up while you push the bolt back, or, again, by pushing up the watch-spring between any two of the tumblers, and holding the end *b* of the protector with it, so as to press the stump against the tumblers. Both these devices, however, are prevented now by letting in a feather FF in a groove between the bolt and the back of the lock, which no watch-spring can pass, and also bringing a piece of the feather forward through the front gating of the tumblers just under the stump. In this form the lock is safe against any mode of picking at present known, unless the keyhole happens to be large enough to admit the inspecting method, which is this. A person intending to pick the lock goes beforehand and smokes the bellies, or lower edges of the tumblers, through the keyhole. When the key comes, it wipes off the black on each tumbler, according to the length of the bit which raises it; and then, when the picker returns, he throws a strong light into the keyhole, and, by means of a narrow reflector put into it, reads off, as it were, the length of bit required to raise each tumbler to the proper height. This operation may sound impossible; but it is an established method of lock-picking in America. It requires a largish keyhole, however, and it may be prevented by any kind of revolving cylinder which will conceal the view of the tumblers while the keyhole is open. The inspecting method might also be frustrated by making the acting part of the bellies of all the tumblers no longer than would be reached by the shortest bit in the key. In that case, the long bits would not begin to act at their points, but on their sides, and would leave no measure of their length upon the tumblers.

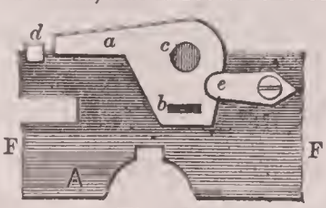

Fig. 17.

A multitude of other many-tumbler locks acted on by springs, and with various kinds of detectors and revolving curtains, all more or less upon the same principles, may be seen described in Price's book above mentioned,

but we are not aware that any of them have ever come into general use, or are superior to Chubb's or equal to Hobbs's protector locks. There is another group of locks which involve fanciful and thick ugly keys, and for that or other reasons have not got much beyond patents and exhibitions. "Revolving curtains" have been proved to be less serious impediments to picking than they would seem, inasmuch as they must leave room for an instrument no thicker than the key itself to turn. The only kind of curtain that is not open to this objection must be one that absolutely prevents any touching of the bolt while any instrument at all is within the lock, and projects at all outside. Mr. Hobbs accomplished that by the odd-looking contrivance of a key consisting only of its web, or flat or acting part, which is pushed into the lock, and then carried round by a fixed handle in another place, which closes the keyhole until it has come round again and delivered the key-web ready to be taken out by a proper hook. But this was too troublesome for common use. The same object is effected in another way by Sir E. Beckett's lock, which we shall presently describe.

Tucker's Locks.—There have been several locks on the disk principle invented in succession by Mr. Tucker of Fleet Street, London, the first two of which had re-

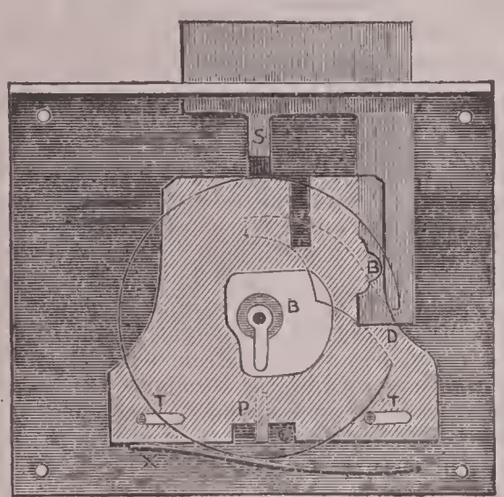

Fig. 18.

volving disks; and in the last and more simple one, patented in 1855, though the disks no longer revolve, they slide between fixed plates without springs, and do not turn on a pin like common tumblers, and will stand indifferently anywhere. It will be sufficient to describe the last of these inventions, as Mr. Tucker himself states it to possess all the elements of security of the former ones, with the advantages of being much cheaper, because more simple in construction. In fig. 18 TT is one of the sliders, which are separated by thin fixed plates, and slide upon the guide-pins at TT, and have also friction-springs X pressing on them to keep them steady. S is the bolt stump, which can only enter I, the gating of the tumblers, when they are pushed the proper distance towards the left, which the key will do as soon as it turns towards the left, in the usual way of unlocking. But something else still prevents the bolt from falling, and that is the flat curtain C, which turns with the key, and has also a barrel B, as in several of the other locks we have spoken of. This curtain prevents the stump from being pressed against the tumblers, being just big enough to keep it from touching them until it has turned nearly three-quarters round, when the pin S, which stands up on the stump, can enter the opening D in the curtain (shown by a dotted line in the drawing, to prevent confusion). But by the time the curtain has got so far round, any instrument in the keyhole would be prevented by the barrel from reaching the tumblers so as to push them back and feel the pressure of the stump; at least so the inventor asserts, and we do not venture to contradict him; but it must be remembered that no revolving curtain and barrel have yet been able to prevent the instruments of the American lock-pickers from reaching and moving the tumblers at the same time that the barrel is being pressed the other way in order to keep up pressure on the bolt.

We have not yet explained how the bolt in this lock is drawn back when the curtain has got into the proper position for it. It is not done by the last bit in the key acting directly on the bolt as usual, but by a bit P fixed on the curtain itself, which acts upon the notch B in the bolt, as the key usually does. And this same bit P performs another function in locking, viz., shooting all the tumblers into the position here shown by striking against a pin which is set in the bottom one, and comes up to the curtain, and so carries all the others with it by means of the square notch which is cut in all of them, except the one which has the pin in it. It must be observed that the curtain does not lie close upon the tumblers, but there is the thickness of the bolt, or of the bit P, between them. A spring locks into the curtain and prevents it from being turned, except when this spring is pressed down by putting a key into the keyhole. One object of making the curtain, and not the key, to lock and unlock the bolt is that you guard against the risk of what is called short-locking, *i. e.*, sending the bolt in any common tumbler-lock not quite far enough for the tumblers to drop. There are means by which a person intending afterwards to pick a lock might cause it to lock short, if he had previous access to it, or possession of the key, at least as locks are generally made, and then, of course, he has only to pull the bolt back, the tumblers having never fallen. Moreover, this arrangement in Tucker's lock allows it to be locked by any key that will turn in the keyhole, though it cannot be unlocked by any but the true key, or one which will move all the tumblers to the right place for the stump to enter them. Mr. Tucker has also applied the curtain in his padlocks in such a way that the shackle has a tail reaching inwards and resting against the curtain at all times, except when it is in the proper position for opening, *i. e.*, when this tail is opposite to a segment cut out of the curtain corresponding to the opening D in the lock just now described, but much larger. The object of this is to obtain greater strength than usual to resist all attempts to force the shackle open. The cheapness of these locks is due to the circumstance that all the principal parts can be stamped out of sheet brass, the curtain alone being cast with the barrel and bit P on it, and its face turned, which is a cheaper operation than filing. In this respect it approaches to Mr. Hobbs's style of lock-making; only he has carried the stamping and machine-finishing system much further; indeed, it is hardly exaggerating to say that he has abolished the use of the file, and left nothing to hand labor except the mere fitting of the pieces together, and putting the tumblers in the right position to have the gating cut according to the key.

Nettlefold's Bolt.—We have already alluded to padlocks, and we shall do so no farther, because they are generally of exactly the same internal construction as other locks of the same maker. And, for the same reason, it is unnecessary to describe the various modifications of the fastening part of locks to adapt them to peculiar uses or positions; but there is one which does seem to be worth a short notice, viz., an invention of Mr. Nettlefold, patented in 1839, for making the bolt hook into the striking plate, against which it locks. Fig. 19 will explain the nature of the contrivance at once. We have inserted no tumblers, because it may be used with one kind of lock as well as another. It is convenient for writing-desks, sliding cupboards, and even for drawers, which can often be prized open by merely putting in a screw-

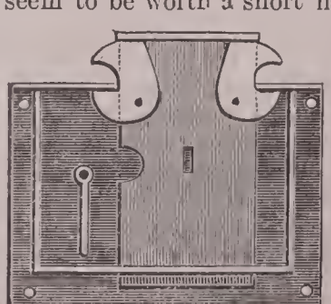

Fig. 19.

driver above the lock, and forcing up the piece over it just enough to let the bolt, which is generally short, pass. There are other ways of doing the same thing, such as making the bolt itself hooked, and giving it two motions, first vertical, to shoot it out, and then horizontal, to hook it into the striking plate; and some Bramah locks are made with a kind of annular bolt, which forms a rim to the cylinder, with a segment cut off in one place to let the striking plate come down, which is then taken hold of by the other part of the ring as it revolves. Bramah locks of portfolios, and articles of that kind, are usually made in this way, which is very cheap and simple.

Master-Keys.—It is often convenient to have a set of locks so arranged that the key of one will open none of the others, and yet the owner of the whole may have one master-key that will open them all. In the old locks with fixed wards this was done by making the wards of a slightly different form, and yet such that one skeleton will pass them all, just as the skeleton-key in fig. 4 will serve for the warded key of fig. 3, and a multitude of others. In locks with sliders or tumblers, the way is to make one tumbler in each lock with a wider gating, so as not to require lifting so high as it does in the other locks of the set; then the key of that lock will raise that tumbler in that lock high enough to clear the stump, and yet the master-key, which has a longer bit in that place, will not raise it too high, because the gating is wide enough for both; but the special key of that lock will not open any other of the set which has not the same tumbler widened in the gating. Mr. Chubb, many years ago, made a set of locks for the Westminster Bridewell, with keys for the different grades of officers. The owner of the head key can stop out any of the under keys; and if any attempt is made to pick any lock, and the detector is thrown, it cannot be released by any of the subordinate keys, though they can open the lock in its normal state, and consequently the governor must be acquainted with it. There are a variety of other forms of many-tumblered locks, but none of them involve any novelty in principle, and they are all capable of being dealt with in the same way; and therefore we shall at once pass on to another class of locks, viz., those which shut of themselves, and are called—

Spring or Latch Locks.—These locks we chiefly notice because they require a particular provision to make them in the smallest degree secure, and are, nevertheless, often left without it, by way of saving a shilling or two in their price, and multitudes of street-door robberies are committed in consequence. The former of these two names is generally used for a lock which shuts of itself on a box or drawer, or articles of that kind; and the latter for street or room-door locks which shut of themselves, and open with a handle on the inside, but only with a key on the outside. In the simplest and cheapest form of these locks there is no pretence of any security except a few fixed wards, which the key has to pass; and, as before explained, that is no security at all against anybody with the smallest dexterity, and with a serious intention of opening the lock. Next to them, or rather below them, pretending to be what they are not, come the locks which lock a certain distance themselves by means of a spring, but can be locked further by the key, and have tumblers, but no fixed wards (which a good tumbler-lock does not require). But though this kind of lock cannot be opened when it is thus double locked, except by the key, or some efficient mode of picking, yet when they are only self-locked the tumblers are of no more use than if they did not exist, and the lock can be opened by any bit of bent wire that will go into the keyhole. It should be remarked, however, that the Bramah lock is just as secure as usual when used for a spring or latch lock, because the key cannot turn at all without pushing in the sliders properly. But in this, as in all latch-locks, it is very unsafe to have a handle which pulls back, as it can easily be reached by a wire put through a hole in the door; the handle should always be made to turn, like a common room-door handle.

There are two ways in which spring-locks with tumblers are made as safe as the same lock with an ordinary bolt. One is to make a click or catch fall into the bolt when it is drawn back, and not to make the tumblers to fall when the bolt is drawn back; in the shutting of the door this catch is pushed back by some knob projecting for the purpose, and then the tumblers fall and hold it fast. Prison locks are made in that way. But this will not do for a latch-lock which is intended to open by a handle on one side of the door. For that purpose the proper plan is that which is now adopted in all good latch and spring locks, not to let the key act directly on the bolt, which has no stump, but on the false bolt which lies on the top of the real one, and has the stump fixed in it. When the real bolt is shut by the spring it carries the false one with it, and that is then locked by the tumblers. But the real bolt can be pushed back by the door shutting, or pulled back by the handle, without moving the false bolt, though it cannot be reached through the keyhole. In buying a lock, the test of this is to see whether the stump moves as you push or pull the bolt back. If it does, the lock is good for nothing, unless it is on some other peculiar construction.

Latches and Latch Locks.—The latter of these, so called by Mr. Chubb, is substantially on the principle just now described, and so is Hobbs's and Hart's latch lock, which also has the protector stump, and therefore is as unpickable as their other locks provided neither the handle nor the bolt can be got at. Chubb's latch (not his latch-lock) consists only of four tumblers, which come out and form the bolt, and fit between a sort of mouth in the striking-plate on the door post, and have all to be lifted to the same height by the key; but that can easily be picked by the tentative method, though it might delay a common street thief for an inconvenient time.

Spring Curtain.—All latch locks for street doors are liable to stick fast through dirt getting between the tumblers, especially in a smoky town. They will keep clean much longer if the keyhole is protected by Sir E. Beckett's self-acting spring curtain, which can be added to any lock which is worth it. It consists only of a small thin steel plate, sliding on the key-pin, and another pin just below the keyhole to guide it, with a slight spring behind, for which there is room in any latch lock with a sliding locking plate over the bolt. They are not patented, and the cost is quite insignificant, and it is odd they are not more commonly insisted on by purchasers.

Safe Locks with Small Keys.—In all the locks we have yet mentioned the bolt is acted on by the key, even though the key may not touch it; the key must therefore be strong enough to move the bolt besides lifting the tumblers, or whatever is substituted for them, and this makes the key for a large lock too large and heavy to be conveniently carried in the pocket, and a bunch of such keys impossible. To get over this difficulty, most of the makers of iron safes have adopted the plan (we do not know by whom invented) of shooting a large bolt, or a number of bolts, by means of a handle, and then a small lock with a small key locks into one of them, and thus fastens them all. The security then depends upon the impregnability of the small lock against fraudulent picking or forcible evisceration. There are certain thieves' instruments by which a force sufficient to tear open the inside of a lock can be inserted through a keyhole of the common size. This, however, is now defeated by cutting out a piece of the back plate, and then screwing it on again with only a few small screws; and so that alone gives way under any bursting pressure, whether from the instrument called the jack-in-the-box, or from gunpowder, which is another of the thieves' methods for cutting the knot which they cannot untie. If the small lock, therefore, cannot be picked, or forced, this mode of locking the

bolts of a large door is quite safe, and you have the advantage of a very powerful lock with nothing to carry in your pocket larger than a small desk key.

Sir E. Beckett's Lock.—A lock was invented by Sir Edmund Beckett (formerly Denison) in 1852, but not patented, which combines the advantages of large and strong works with a keyhole so narrow that no instrument strong enough to injure the lock could be got in, nor a reflector to observe the bellies of the tumblers; and the bolt is not only shot by turning the handle, but locked besides, without using any key at all. This lock enjoys the distinction of being the only one of English invention which was pronounced secure against any known method of picking by Messrs Hobbs and Tomlinson, in the treatise before referred to.

In figure 20 are shown the tumblers T, turning on a pin at or near the middle of their length, so as to

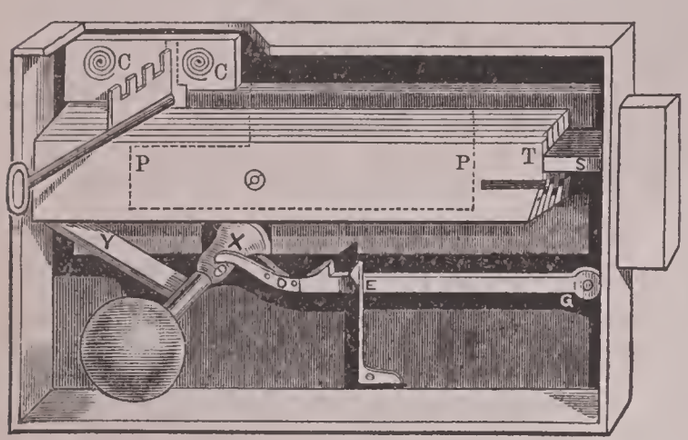

Fig. 20.

be nearly balanced, though in small locks this is unnecessary. Between every two adjacent tumblers, and between the bolt and the tumbler next to it, there is a thin steel plate, which occupies the position shown by the dotted lines PP. These plates have one edge lying against the upper side of the lock, so that they cannot turn at all on the tumbler-pin, which goes through them quite loosely. One or two of the plates should be bent a little to make them act as friction springs on the tumblers when the cap of the lock is on, so that they will stand indifferently in any position. In the figure they are drawn all pressed down, so as to prevent the stump S from entering the gating, and this has been done by the long tail Y of the handle, which, it is easy to see, will raise the left end of the tumblers, and depress the right, after the fan-tailed piece X of the handle has shot the bolt. After the tumblers have been raised to the proper height by turning the key half round (where it may be stopped by the plates P, P), the stump can enter the gatings, and the bolt can be drawn back by the handle, the tail Y then doing nothing. So far as we have yet gone, the lock would possess no greater security than any other many-tumblered lock; but there is a steel curtain CC, which does not revolve as usual, but slides on two pins sets in the back of the lock, and is pressed up against the front plate by two spiral springs, so as to close the keyhole completely, except when it is pressed in. From the back of the curtain there goes a kind of square plug (shown in section at fig. 21), which can be pushed through a hole in the back plate, and has a notch in it just in the plane of the bolt, and the bolt itself has a corner there; in this way, when the curtain is up, the bolt can be drawn back through the notch in the curtain plug; but when the plug is pushed in ever so little the bolt cannot be drawn back, because its corner cannot pass the curtain plug, and in this position the stump cannot

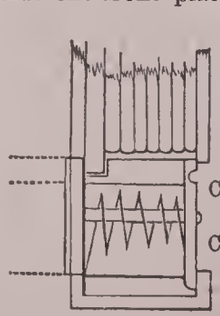

Fig. 21.

be made to touch the tumblers, except one of them, which is made a little longer than the rest (as shown at T in fig. 20), in order to keep the bolt steady. It is evident then that as soon as the curtain is pushed in, to admit any instrument whatever, the bolt is held fast, and it becomes impossible to put any pressure of the stump upon the tumblers; in other words, the tentative mode of picking is impossible. In small locks the curtain has no plug, but merely works against the edge of a second stump of the bolt, which can only pass when the curtain is up, and it slides on the drill-pin and another pin below it.

The security of the lock is farther increased by the addition (DEG) of what may be called a detector, as it does detect if the bolt has not been shot far enough by the person who locked it, and, what is of more consequence, prevents it from being opened in that state. It turns on a hinge or pin at G, and is held up or down by a jumper-spring at E, as in Chubb's first detector. In fig. 20 it is shown as held down, or out of the way of the bolt; but, as the handle turns back again and draws back the bolt, the pin below X raises the detector a little, and then the spring is ready to throw its tooth into the notch in the bolt as soon as it is shot only about half-way. In that state the bolt cannot be drawn back without turning the handle far enough for the fan-tail X to send the detector down again below the corner of the spring, and by doing that you will also have locked all the tumblers, and so made the lock fast until the key comes to open it. And it is to be observed that the curtain cannot be pushed in until the bolt is fully shot, so that no exploration of the lock can take place while it is open, or even partially open. By adding a spring catch under the curtain, to be freed by one of the tumblers when it is fully locked, it may be arranged, if required, that the curtain could not be pushed in, not only until the bolt is shot, but until the tumblers are locked also.

The following, therefore, are the advantages of this lock. 1. A very large lock, with all its parts strong, only requires a very small key, not weighing above a quarter of an ounce. 2. No key is required to lock it, and you cannot leave the key in the lock (a fruitful source of mischief), and yet it is free from the inconvenience of spring locks which sometimes shut themselves when not intended, and moreover, when large, require large and strong keys to open them. 3. It cannot get out of order from the usual causes of the tumblers sticking together, or tumbler-springs breaking, because there are none, and the tumblers do not touch each other, but the friction plates between them. 4. The keyhole being always quite closed by the curtain, except while the key is in, the lock is protected from dirt and from the effects of a damp or smoky atmosphere, which injures other locks. 5. The smallness of the keyhole prevents the insertion of any instrument strong enough to force the lock, and also prevents inspection. 6. It is pronounced by the highest authority to be secure against any known mode of picking. 7. It requires no delicacy of construction or high finish in any of the parts, and the moving parts are few—in fact, the whole of them together are fewer than the number of springs alone in the great American lock of Day & Newell. 8. It is free from the incumbrance of a patent, the inventor being one of those who agree with the opinion of the jury on philosophical instruments in the exhibition of 1851, and with many of the first engineers and most scientific men, that "patents are a great obstruction to the progress of science," and waste, on the whole, more money than they gain for real inventors.

Changeable Key Locks.

Any lock with many tumblers may be changed by taking it off and transposing any two or more of the tumblers; but it will then want a different key, and the process is too troublesome to be resorted to except when there is reason to apprehend that the original key has fallen into bad hands, or had a copy taken of it. A lock which can be locked by a great number of keys, but can only be opened by the one which locked it last, is evidently an immense addition to security. Those keys may either be all distinct, or there may be a great number of different webs, or stepped parts, fitting to a common handle; or each bit or

step may be separate, and all screwed together into the key frame as shown in fig. 22.

In a lock with n tumblers, each raisable to m distinct heights, if you have only n loose bits of the m different

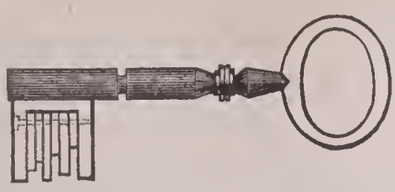

Fig. 22.

heights you may compose $1 \times 2 \times 3 \ldots . n$ keys, which for nine tumblers = 362,880. But if you also have m bits for each place in the web, the possible number of different keys is very much greater, viz., m^n; for every possible length of bit in each place may be used with every possible length in every other place. If m is 7 and n 9, as they are in the locks we are going to describe next, each lock may have very nearly sixty million different keys, or key-webs capable of fitting into one shank or handle; and the chances are so many against a lock-picker hitting on the right one.

The first changeable key lock known in England was Day & Newell's "Parautoptic" (inspection-defying) lock, which was brought from America by Mr. Hobbs at the time of the 1851 Exhibition, and has been largely used since for banks and other safes. It was fully described in the last edition of this work, and in the books above referred to; but in this place we will describe instead a much simpler form of it, since introduced by Mr. Hart of the firm of Hobbs, Hart & Co. The principle of all changeable key locks is that instead of a single stump fixed to the bolt, there are as many stumps as tumblers, and each one is the projecting part S of a slider PPS which can ride up and down on two pins PP in the bolt, and will stay at any height where it is left when the bolt B is shot. Fig. 23 shows the lock open and the slider stumps lying in the jaws or gating of the tumblers ready to be raised to any height. In fig. 24 the bolt has been shot, and the sliders

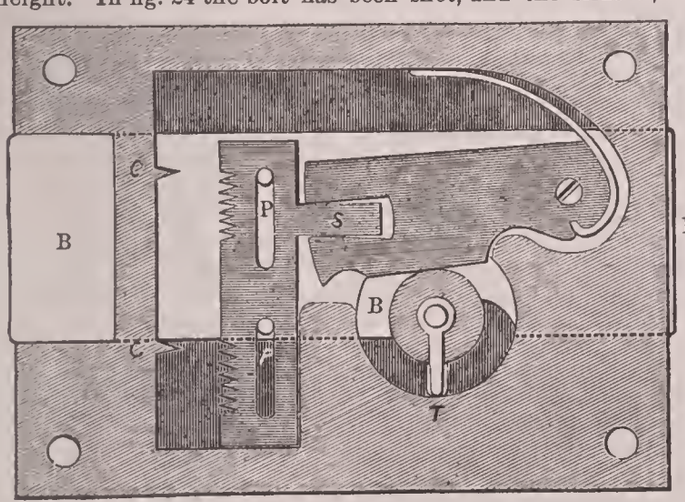

Fig. 23.

carried forward with it. Just before they leave the tumblers they are received by the two small teeth C, C on the frame of the lock, holding each slider at whatever height it may then be; those teeth go right down to the thin part of the bolt or as deep as the sum of all the tumblers and sliders. In this figure the topmost slider is received at its third notch, and each of those below it at some other notch. The tumblers having fallen behind all the stumps, the sliders cannot move until the tumblers are all raised again to the various heights at which they left them, which is possible only by the key that locked the lock. These locks have Hobbs's protector behind the bolt; and the bit which moves the bolt is behind a revolving curtain (the darkest circle), which is kept steady by one of the tumblers resting on its flattened top. The bellies of the tumblers are shortened, to obviate a certain trick by which one of Newell's locks was picked, but which it is not necessary now to explain. So far as we can judge, this lock has more than all the advantages of that, as it is much less complicated and liable to get out of order from any cause except that to which all locks with spring tumblers are liable, viz., from two tumblers getting stuck together by dirt, so that one of them rises too high with its neighbor. Oiling tumblers is accordingly fatal to them, though it is necessary in other parts of a lock.

The keys of these locks are practically made not of distinct bits screwed into a key frame as in fig. 22, which is the plan used in the Day & Newell lock, and makes a heavy thing to carry, but separate webs are made, each complete in itself, and fitting into a thickish key pipe which need not be carried about. You may leave it near the safe, and lock up therein, or keep somewhere else, all the bits except the one you use for the day, and carry that in your waistcoat pocket. For such a lock as that described you may have as many of the sixty million bits as you like, and may get new ones from time to time. Or you may have separate bits, as in the parautoptic lock, but in that case you must take good care of the key whenever the lock is shut.

The risk of tumblers sticking together in a changeable

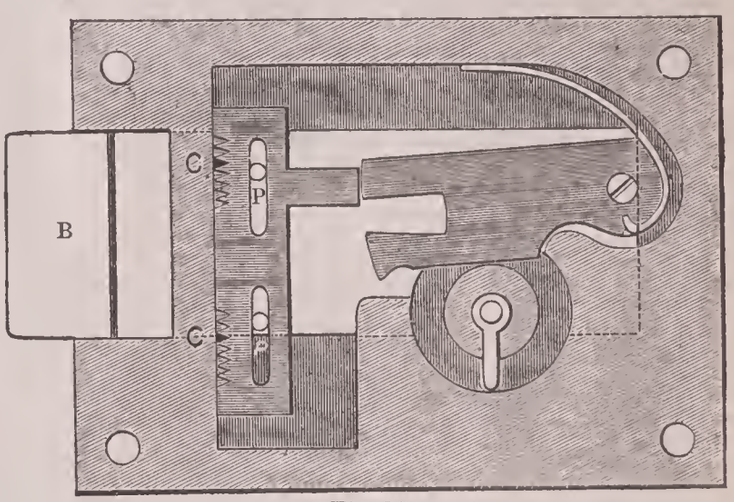

Fig. 24.

lock, or any other, may be obviated by not using springs but putting thin plates between the tumblers, as in Sir E. Beckett's lock, giving the tumblers tails coming down on the right of the keyhole in figs. 23, 24, and making the revolving curtain act on all the tails just before the key comes out, by means of an intermediate lever, or else by a small handle which might at the same time bring an escutcheon or external curtain over the keyhole.

Yale Lock.

This American lock is remarkable for the smallness of its key, which is shown from k to a in fig. 25, full size, and is a thin flat piece of steel weighing only ·1 of an ounce. The narrowness of the keyhole would be an impediment to introducing a picking instrument together with any other intended at the same time to give a twisting pressure to the small barrel *abc*, which has to turn, as in the Bramah lock, in order to move the bolt, which is not shown in these figures. That may be done either as in Bramah locks or by a tongue or bit attached to the end *ab* of the barrel as in several other locks. The barrel is prevented from being turned, except by the proper key, thus. The (apparently) five plugs with spiral springs over them in fig. 25 are really all divided at the cross line *bc*, being all now lifted to the proper height by the key. Consequently the barrel *abc* can turn round, as there is no plug either pro-

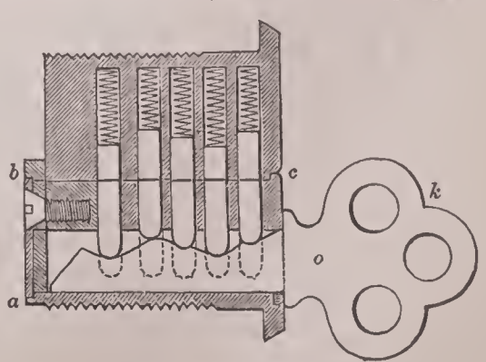

Fig. 25.

jecting from it or projecting into it. But when the key is out, all the plugs are pushed down by the springs, and

so the upper ones descend into the barrel and hold it fast. And again, if any of the steps of a false key are too high, some of the lower plugs will be pushed up beyond the barrel into the holes above them, and so the barrel cannot turn. The bevelled end of the key near *a* enables it to be pushed in under the plugs, though with some friction and resistance. It does not appear, however, to be any more secure than the Bramah lock, except by virtue of the smallness of its keyhole. Nor is the flatness and thinness of the key of any particular value on a bunch of keys, though very convenient for a single latch key to be carried in the waistcoat pocket, as extreme security is not requisite for latch locks.

Yale Time Lock.

The same company have an entirely different kind of lock from all the preceding ones; it consists of a watch in a case enclosed within the safe door, and has a dial with pins marked for every hour, something like a "tell-tale clock." Any number of these pins can be pulled out a little, and the watch will let a weighted lever fall against the bolts of the safe during all those hours, and hold it up during all the other hours, or *vice versa*. For security the case contains two such watches, so that one may do the work if the other happens to fail. Thus no key is used (except the watch key for winding), but the safe can be opened by a handle moving its bolts at such hours as the watch is set for, and at no other.

It should be added that Mr. Hobbs introduced into England in 1851 the American system of manufacturing every part of a lock by machinery, so that all similar locks of a given size are exactly alike, except the keys, and the gating in the tumblers, which is cut when they are lifted by the key; and even those are done by machinery adjustable to secure what may be called an infinite number of variations. The same system has been adopted in the Government rifle manufactories, and for clocks and watches; and no hand-work can compete with it. (E. B.)

LOCKE, JOHN (1632–1704). Some idea of the man and his surroundings is more needed for the interpretation of what Locke has written than in the case of most philosophers. His youth was spent amidst the war of principles of which England was the scene in the middle of the 17th century. In later life he mixed much with the chief actors in the political drama that followed the Restoration. In his advanced years he was the intellectual representative of tendencies which at the Revolution settlement inaugurated the tranquil material progress and tolerant but more prosaic spirit of the 18th century in England. It is instructive to see how the foundations of belief and the constitution of knowledge are investigated by an English gentleman, who was no recluse mediæval monk or pedantic modern professor, but a man of the world, practically conversant with affairs, in tone calm and rational, and now justly regarded as the typical English philosopher.

Locke was born in the county of Somerset, on the 29th of August, 1632, six years after the death of Bacon, and three months before the birth of Spinoza. His father was a small landowner and attorney at Pensford, near the northern boundary of the county, to which neighborhood the family had migrated from Dorsetshire early in the century. The elder Locke, a strict but genial Puritan, by whom the son was carefully educated at home, was engaged in the military service of the popular party when the son was a boy, Bristol being one of the centres of the war. "From the time that I knew anything," Locke wrote in 1660, "I found myself in a storm which has continued to this time." For fourteen years his education was going on at home, in the Puritan family. The house at Belluton, on his father's little estate, in which these years were spent, may still be seen on the side of one of the orchard-clad vales of Somerset, half a mile from the market-town of Pensford, and 6 miles from Bristol. The actual place of Locke's birth was at Wrington, 10 miles westward, in a house which still exists, where his mother chanced to be on a visit.

In 1646 he entered Westminster School, then of course under Puritan control, and at the headquarters of the parliamentary movement. The six following years were mostly spent there. He does not seem to have liked Westminster, and its memories perhaps produced the bias against public schools which afterwards almost disturbed his philosophic impartiality in his *Thoughts on Education*.

In 1652 Locke passed from Westminster to Oxford. He there found himself at Christ Church, in charge of John Owen, the newly appointed Puritan dean, and vice-chancellor of the university. Christ Church was more or less Locke's home for thirty years. For eight years after he entered Oxford was ruled by the Independents, who, through Owen and Goodwin, unlike the Presbyterians, were among the first in England to promulgate the principles of genuine religious liberty. Locke's hereditary sympathy with the Puritans was gradually lessened by what he saw of the intolerance of the Presbyterians and the fanaticism of the Independents. He found, he says characteristically, that "what was called general freedom was general bondage, and that the popular assertors of liberty were the greatest engrossers of it too, and not unfitly called its keepers." The influence of the liberal divines of the Church of England became apparent afterwards in the progress of his mental history.

Oxford had suffered as a seat of learning during the civil war. Under Owen the scholastic studies and disputations were maintained with a formality unsuited to Locke's free inquisitive temper. The reaction against them which he expressed showed thus early a strong disposition to rebel against empty verbal reasonings. He was not, according to his own account of himself to Lady Masham, a very hard student at first. He sought the company of pleasant and witty men, with whom he likewise took great delight in corresponding by letter; and in conversation and in these correspondences he spent much of his time. He took his bachelor's degree in 1656, and that of master in 1658, the latter on the same day with Joseph Glanvill, the author of *Scepsis Scientifica*. In December, 1660, he was made tutor of Christ Church, and lectured in Greek, rhetoric, and philosophy in the following year.

At Oxford Locke was within reach of distinctive intellectual influences, then of great strength, and particularly fitted to promote self-education in a strong character. The metaphysical works of Descartes had appeared a few years before he entered Christ Church, and the *Human Nature* and *Leviathan* of Hobbes during his undergraduate years. It does not seem that Locke read extensively, but he was soon drawn to Descartes. The first books, he told Lady Masham, which gave him a relish for philosophical things were those of Descartes. He was delighted in reading them, though he very often differed in opinion from the writer, for he found that what he said was very intelligible. After the Restoration he lived amidst the influences which were then drawing Oxford and England into experimental research. Experiments in physics became the fashion after 1660. The Royal Society was that year founded at Oxford. Wallis and Wilkins, and afterwards Boyle and Wren, at Oxford, and Barrow and Newton at Cambridge, helped to make chemistry, meteorology, and mechanics take the place of verbal disputes. We find him, accordingly, at work in chemistry about 1663, and also in the meteorological observations which always interested him.

The restraints of professional life were not well suited to Locke. There is a surmise that he once contemplated taking orders in the Church of England. His religious disposition attracted him to theological studies. His revulsion from the severe dogmatism of Presbyterians and the unreasoning fanaticism of Independents favored that connection with liberal Anglican churchmen which he maintained in later life. Whichcote was his favorite preacher, and latterly his closest intimacy was with the Cudworth family. But, though he has a place among the lay theologians of England, his dislike to ecclesiastical impediments to free research, as well as his taste for experimental investigations, led him in the end to turn to medicine when he had to think about a profession. This was soon after the Restoration, and

before 1666 he seems to have been practising medicine in Oxford. But, though afterwards known among his friends as "Doctor Locke," he never graduated as a physician. His health was uncertain, for he suffered all his life from chronic consumption and asthma, and besides that an event soon occurred which withdrew him from medical practice. To the end, however, he was fond of the science, and also ready on occasion to give friendly advice.

Locke had early shown an inclination to politics as well as to theology and to medicine. In 1665 he diverged from medical study at Oxford to diplomacy, and was engaged for a few months in this sort of business, as secretary to Sir Walter Vane on his embassy to Cleves. It was soon after his return from Germany in the following year that the incident occurred which determined his career in the direction of politics. Lord Ashley, afterwards first earl of Shaftesbury, the most truly historical figure among the statesmen of Charles II.'s reign, had come to Oxford for health. There Locke was accidentally introduced to him. This meeting was the beginning of a lasting friendship, sustained by a common sympathy with liberty—civil, religious, and philosophical. In 1667 Locke removed from Christ Church to Exeter House, Lord Ashley's London residence, to become his private secretary, and in 1673 secretary of the Board of Trade. Although he retained his studentship at Christ Church, and occasionally visited Oxford, and also his patrimony at Beluton, lately inherited from his father, he found a home and shared fortune with the great statesman during the fifteen years which followed his removal to Exeter House.

The manuscripts of Locke which belong to this Oxford period throw welcome light on the growth of his mind in early life. Among them is an essay on the "Roman Commonwealth," which expresses convictions as to religious liberty and the relations of religion to the state which were only strengthened and deepened in the progress of his life. Objections to the sacerdotal conception of Christianity are strongly stated in another paper; short work is made of human claims to infallibility in the interpretation of Scripture in a third; a scheme of utilitarian ethics, wider in its conception than that of Hobbes, is offered in a fourth. But the most significant of those early revelations is an "Essay concerning Toleration," dated in 1666, which anticipates many of the positions maintained nearly thirty years later in his famous *Letters* on that subject.

The Shaftesbury connection helped to save Locke from those idols of the den to which professional life in every form is exposed. It brought him much in contact with public men, with the springs of political action, and with the details of office. The place he held as confidential adviser of the greatest statesman of his age is indeed the most remarkable feature in his middle life. Exeter House afforded every opportunity for society, and of this Locke, according to his disposition, availed himself. He became one of the intimates among others of the illustrious Sydenham. But though he joined the Royal Society he seldom went to its meetings, for his custom all his life was to encourage small reunions of intimate friends. One of these at Exeter House was the occasion of the enterprise which has made his name memorable in history; for it was there that "five or six friends" met one evening in his rooms, about 1671, and discussed "principles of morality and religion" which seemed remote from questions about "human understanding." They "found themselves quickly at a stand by the difficulties that arose on every side. Locke suggested a careful examination of the exact limits of man's power to know the universe as the proper way out of their difficulties. The results of the reflection to which these difficulties thus gave rise, he thought, when he set to work, might be contained on "one sheet of paper." But what was thus "begun by chance was continued by entreaty, written by incoherent parcels, and after long intervals of neglect resumed again as humor and occasions permitted," till at last, at the end of nearly twenty years, it was given to the world as the *Essay on Human Understanding*. This work gave intellectual unity and a purpose to his life as a man of letters and philosophy.

The fall of Shaftesbury in 1675 enabled Locke to escape for four years from the centre of English politics to a retreat in France, where he could unite the study of "human understanding" with attention to health. He spent three years partly at Montpellier and partly in Paris. His journals and commonplace books of this period show the *Essay* in process of construction. The visits to Paris were times of meeting with men of letters and science, among others Guenellon, the well-known Amsterdam physician; Römer, the Danish astronomer; Thoynard, the critic; Thevenot, the traveller; Justel, the jurist; and Bernier, the expositor of Gassendi. There is no mention of Malebranche, whose *Recherche de la Vérité* had appeared three years before, and who was then at the Oratoire, nor of Arnauld, his illustrious rival at the Sorbonne.

Locke returned to London in 1679. A reaction against the court party had for a time restored Shaftesbury to power. Locke resumed his old confidential relations. A period of much interrupted leisure followed. It was a time of plots and counterplots, when England seemed on the brink of another civil war. In the end Shaftesbury was committed to the Tower, tried, and acquitted. More insurrectionary plots followed in the summer of 1682, after which, isolated at home, he escaped to Holland, and died at Amsterdam in January, 1683. In these two years Locke was much at Oxford or at Beluton. The last movements of Shaftesbury did not recommend themselves to the sage caution of his secretary. Yet the officials of government kept their eyes on him. "John Locke lives a very cunning, unintelligible life here," Prideaux reported from Oxford in 1682. "I may confidently affirm," the dean of Christ Church afterwards wrote to Lord Sunderland, "there is not any one in the college who has heard him speak a word against, or so much as censuring, the Government; and, although very frequently, both in public and private, discourses have been purposely introduced to the disparagement of his master, the earl of Shaftesbury, he could never be provoked to take any notice, or discover in word or look the least concern; so that I believe there is not in the world such a master of taciturnity and passion." Some unpublished correspondence with his Somerset friend, Edward Clarke of Chipley, describes his daily life in these troubled years, and refers to intercourse with the Cudworth family, who were intimate with the Clarkes. The commonplace books and letters about the same time allude to toleration in the state and comprehension in the church, and show an indifference to questions on which theological disputers lay stress, hardly consistent with a strict connection with any organized body of Christians, notwithstanding his gravitation towards the Church of England as the most liberal community.

In his fifty-second year, in the gloomy autumn of 1683, Locke retired to Holland in voluntary exile. It was then the asylum of eminent persons who were elsewhere denied civil and religious liberty. Descartes and Spinoza had meditated there; it had been the home of Erasmus and Grotius; it was now the refuge of Bayle. Holland was Locke's sanctuary for more than five years; but it was hardly a voluntary retreat. His (unpublished) letters from thence represent a man of tender feelings, on whom exile sat heavily. Amsterdam was his first Dutch home. For a time he was in danger of arrest at the instance of the English Government, After anxious months of concealment in the houses of friends, he escaped; he was, however, deprived of his studentship at Christ Church, and Oxford was finally closed against him by order of the king. But Holland introduced him to new friends. One of these, ever after an intimate correspondent,

was Phiiip van Limborch, the successor of Episcopius as Remonstrant professor of theology, lucid, learned, and tolerant, the friend of Cudworth, Whichcote, and More. Limborch attached him to Le Clerc, then the youthful representative of letters and philosophy in Limborch's college, who had escaped from Geneva and Calvinism to the milder atmosphere of Holland. The *Bibliothèque Universelle* of Le Clerc, commenced in 1686, soon became the chief organ in Europe of men of letters. Locke was at once united with him in the work, and contributed several articles. It was his first appearance as an author, although he was now more than fifty-four years of age, and afterwards produced so many volumes. This tardiness in authorship is a significant fact in Locke's mental history, in harmony with the tempered wisdom and massive common sense which reign throughout his works. The next fourteen years were those in which the world received the thoughts which observation of affairs and reflection had so long been forming in his mind. They were taking shape for publication while he was in Holland. The *Essay* was finished there, and a French epitome of it appeared in 1688, in Le Clerc's journal. Locke was then at Rotterdam, where he lived for more than a year in the house of a Quaker friend, Benjamin Furley, a wealthy merchant and collector of books. The course of affairs in England at last opened a way for his return to his native country. At Rotterdam, he was the confidant of the political exiles, including Burnet and Mordaunt, afterwards the famous earl of Peterborough, as well as of the prince of Orange. William landed in England in November, 1688; Locke followed in February, 1689, in the same ship with the princess of Orange and Lady Mordaunt.

It was after his return to England that through authorship Locke emerged into European fame. Within a month he had declined the embassy to Brandenburg, and taken instead the modest office of commissioner of appeals with its almost nominal duties. The two years, 1689 and 1690, during which he lived at Dorset Court, in London, were memorable for the publication of his two chief works in social polity, and also of the most popular and widely influential book in modern philosophy, which expresses in a generalized form the principles that lie at the root of all his political and other writings. The first of the three to appear was the defence of religious liberty in the state, in the *Epistola de Tolerantia*, addressed to Limborch. It was published at Gouda in the spring of 1689, and translated into English in autumn by William Popple, a Unitarian merchant in London. The *Two Treatises on Government*, in defence of the sovereignty of the people, followed a month or two after. The *Essay concerning Human Understanding* saw the light in the spring of 1690. He received £30 for the copyright, which was nearly the same as Kant afterwards got for the first edition of his *Kritik der reinen Vernunft*. He had carried the manuscript from Holland, ready for the press except a few last touches. It was the first book in which his name appeared, for the other two were published anonymously.

Locke's asthma and other ailments had increased in the latter part of 1690. The air of London always aggravated them. The course of public affairs also disappointed him, for the settlement at the Revolution in many ways fell short of his ideal. It was then that the home of his old age, the brightest of all his homes, opened to receive him. This was the manor house of Oates in Essex, pleasantly situated midway between Ongar and Harlow, the country seat of Sir Francis Masham. Lady Masham was the accomplished daughter of Cudworth, and Locke had known her before he went to Holland. In the course of the two years after his return, she told Le Clerc, "by some considerably long visits Mr. Locke made trial of the air of this place, which is some 20 miles from London, and he thought that none would be so suitable for him. His company could not but be very desirable for us, and he had all the assurances we could give him of being always welcome; but, to make him easy in living with us, it was necessary he should do so on his own terms, which Sir Francis at last assenting to, he then believed himself at home with us, and resolved, if it pleased God, here to end his days—as he did." It was in the spring of 1691 that this idyllic life at Oates began. There, among the green lanes of rural England, he enjoyed for fourteen years as much domestic peace and literary leisure as was consistent with broken health and sometimes anxious visits to London on public affairs. Oates was in every way his home. In his letters and otherwise we have charming pictures of its inmates and its internal economy, as well as of occasional visits of friends who went there to see him, among others Lord Peterborough and the Lord Shaftesbury who wrote the *Characteristics*, Isaac Newton, William Molyneux, and Anthony Collins.

At Oates he was always busy with his pen. The *Letter on Toleration* had already involved him in controversy. The *Answer* of a certain Jonas Proast of Queen's College, Oxford, had drawn forth in 1690 his *Second Letter on Toleration*. A rejoinder in 1691 was followed by Locke's *Third Letter* in the summer of the following year. And other questions divided his interest with this one. In 1691 those of currency and finance were much in his thoughts; in the year after he addressed a letter to Sir John Somers on the *Consequences of the Lowering of Interest and Raising the Value of Money*. It happened too that when he was in Holland he had written letters to his friend Clarke of Chipley about the education of his children. These letters formed the substance of the little volume that appeared in 1693, entitled *Thoughts on Education*, which still holds its place among the classics in that department. Nor were the "principles of revealed religion" forgotten, which a quarter of a century before were partly the occasion of the *Essay*. The circumstances of the time now made him desire to show how few and simple all the essential points held in common by the religious community of England were, and to bring men if possible to agree to differ as individuals regarding all beyond. The issue was an anonymous essay on the *Reasonableness of Christianity as delivered in the Scriptures*, which appeared in 1695, in which Locke tried to separate the divine essence of Christianity from accidental accretions of dogma, and verbal reasoning of professional theologians, ignorant of the limits within which the conclusions of human beings on such subjects must be confined. This irenicon involved him in controversies that lasted for years. A host of angry polemics assailed the book. A now forgotten John Edwards was conspicuous among them. Locke produced a *Vindication* which added fuel to the fire, and was followed by a *Second Vindication* in 1697. Notes of opposition to the *Essay* too had been heard almost as soon as it appeared. John Norris, the metaphysical rector of Bemerton, an English disciple of Malebranche, criticised it in certain *Cursory Reflections* in 1690. Locke took no notice of this at the time, but his second winter at Oates was partly employed in writing what appeared after his death as an *Examination of Malebranche's Opinion of Seeing all Things in God*, and as *Remarks upon some of Mr. Norris's Books*,—tracts which throw important light upon his own theory, or rather want of theory, as to perception through the senses. When he was examining Malebranche he was also preparing the *Essay* for a second edition, and corresponding with his friend William Molyneux at Dublin about amendments in it. This edition, with a chapter added on "Personal Identity," and numerous alterations in the chapter on "Power," appeared in 1695. It was followed by a third, which was only a reprint, later in the same year. Wynne's well-known abridgment in that year helped to make the book known in Oxford, and Molyneux had years before introduced it in Dublin. In 1695 a return to questions about the currency diverted Locke's atten-

tion for a little from metaphysics and theology. Circumstances in that year gave occasion to his tract entitled *Observations on Silver Money* and also to his *Further Considerations on Raising the Value of Money.*

In 1696 Locke was induced to accept a commissionership on the Board of Trade, which made frequent visits to London needful in the four following years, and involved him considerably in the cares of office. Meantime the *Essay on Human Understanding* and the *Reasonableness of Christianity* were both becoming more involved in the wordy warfare between dogmatists and latitudinarians, trinitarians and unitarians, of which England was the scene in the last decade of the 17th century. The controversy with Edwards was followed by another with Stillingfleet, bishop of Worcester, which takes its place among the memorable philosophical controversies of the modern world. It arose in this way. John Toland, an Irishman, in his *Christianity not Mysterious*, had exaggerated some passages in the *Essay*, and then adopted the opinions as his own. In the autumn of 1696, Stillingfleet, who was a learned and argumentative ecclesiastic more than a religious philosopher, in a *Vindication of the Doctrine of the Trinity* wrote some pages on Locke, condemning him especially for eliminating mystery from human knowledge in his account of what is meant by "substance." Locke replied in a *Letter* dated January, 1697. Stillingfleet's rejoinder appeared in May, followed by a *Second Letter* from Locke in August, to which the bishop replied in the following year. Locke's elaborate *Third Letter*, in which the ramifications of the controversy are pursued with a tedious expenditure of acute reasoning and polished irony, was delayed till 1699. The death of Stillingfleet in that year brought this famous trial of strength to an end. (The interesting episode of Molyneux's visit to Oates, followed by his death a few days after his return to Dublin, occurred in 1698, when the Stillingfleet controversy was at its height.) Other critics were now entering the lists against the *Essay.* One of the ablest was John Sergeant, a Catholic priest, in his *Solid Philosophy Asserted Against the Fancies of the Ideists*, in 1697. He was followed by Thomas Burnet and Dean Sherlock. Henry Lee, rector of Tichmarch, produced in 1702 a folio volume of notes on each chapter in the *Essay*, under the title of *Anti-Scepticism;* John Broughton dealt another blow in his *Psychologia* in the following year. About the same time too John Norris returned to the attack, in various passages in his *Theory of the Ideal or Intelligible World.* Locke was defended with vigor by Samuel Bolde, a Dorsetshire clergyman. The *Essay* was all the while spreading over Europe, impelled by the great name of its author as the chief friend and philosophical defender of civil and religious liberty. The fourth edition (the last while Locke was alive) appeared in 1700. It contained two important new chapters on "Association of Ideas" and "Enthusiasm." What was originally meant for a third chapter was prepared but withheld. It appeared among Locke's posthumous writings, under the now well-known title of *Conduct of the Understanding*, in some respects the most characteristic of his works. The French translation of the *Essay* by Pierre Coste, Locke's amanuensis at Oates, was almost simultaneous with the fourth edition. The Latin version by Burridge of Dublin appeared the year after, reprinted in due time at Amsterdam and at Leipsic.

After 1700 Locke was gathering himself up for the end, in the rural repose of family life at Oates. The commission at the Board of Trade was resigned, and the visits to London ceased. Scriptural studies and religious meditation engaged most of his available strength in the four years that remained. The Gospels had been much searched by him when he worked in theology years before. He now turned to the Epistles of St. Paul, and applied the spirit of the *Essay*, and the rules of critical interpretation which apply to other books, to interpret a literature which he still venerated with the submissiveness of the pious Puritans who surrounded his youth. The results of these studies were ready for the printer when he died, and were published about two years afterwards. A few pages on *Miracles*, written in 1702, in connection with Fleetwood's essay, also appeared posthumously. More adverse criticism was now reported to him, and the *Essay* was formally condemned by the authorities at Oxford. "I take what has been done rather as a recommendation of the book," he wrote to his young friend Anthony Collins, a neighboring Essex squire, then a frequent visitor at Oates, and afterwards a leader of free thought, "and when you and I next meet we shall be merry on the subject." One attack only moved him. In 1704 his adversary Jonas Proast unexpectedly revived their old controversy. Locke in consequence began a *Fourth Letter on Toleration.* The few pages in the posthumous volume, ending in an unfinished sentence, seem to have exhausted his remaining strength in the weeks before he died. Thus the theme which had employed him at Oxford more than forty years before, and had been his ruling idea throughout the long interval, was still dominant in the last days of his life. All that summer of 1704 he continued to decline, tenderly nursed by Lady Masham and her step-daughter. On the 28th of October he passed away, as he declared, "in perfect charity with all men, and in sincere communion with the whole church of Christ, by whatever names Christ's followers call themselves." The tomb of Locke may be seen on the south side of the parish church of High Laver, in which he often worshipped, near the tombs of the Mashams, and of Damaris, the widow of Cudworth, bearing a Latin inscription prepared by his own hand. At the distance of a mile are the garden and park where the manor house of Oates once stood, surrounded by a green undulating country, in the lanes of which the slender delicate figure, with the refined reflective countenance made familiar to us by Kneller, was so often seen in the last years of the 17th century.

Locke's history, combined with his writings, has made his intellectual and moral features not less familiar. The reasonableness of taking probability for our ultimate guide in all the really important concerns of life was the essence of his philosophy. The desire to see for himself what is really true in the light only of its reasonable evidence, and that others should do the like, was his ruling passion, if the term can be applied to one so calm and judicial. "I can no more know anything by another man's understanding," he would say, "than I can see by another man's eyes." The knowledge which one man possesses is "a treasure which cannot be lent or made over to another." This repugnance to believe blindly what rested on authority, as distinguished from what was seen to be sustained by self-evident reason or by demonstration or by good probable evidence, runs through his life. He is typically English in his reverence for facts, whether facts of sense or of rational consciousness, in his tendency to turn away from purely abstract speculation and merely verbal reasonings, in his suspicion of mysticism, in his calm reasonableness, and in his ready submission to truth, even when the truth was incapable of being reduced to system, provided only that it served a human purpose. The delight he took in making use of his reason in everything he did, and a wise use of it too, was what his friend Pierre Coste found most prominent in Locke's daily life at Oates. "He went about the most trifling thing always with some good reason. Above all things he loved order, and he had got the way of observing it in everything with wonderful exactness. As he always kept the useful in his eye in all his disquisitions, he esteemed the employments of men only in proportion to the good they were capable of producing; for which cause he had no great value for the critics who waste their lives in composing words and phrases, and in coming to the choice of a various reading in a passage that has after all nothing import-

ant in it. He cared yet less for those professed disputants who, being taken up with the desire of coming off with victory, justify themselves behind the ambiguity of a word, to give their adversaries the more trouble. And whenever he had to deal with this sort of folks, if he did not beforehand take a strong resolution of keeping his temper, he quickly fell into a passion, for he was naturally choleric, but his anger never lasted long. If he retained any resentment it was against himself, for having given way to so ridiculous a passion, which, as he used to say, may do a great deal of harm, but never yet did any one the least good." Large, "round-about," even prosaic common sense, with intellectual strength solidly directed by a virtuous purpose, much more than subtle or daring speculation sustained by an idealizing faculty, in which he was deficient, is what we find conspicuous in Locke's conduct, correspondence, and books. A defect in speculative imagination undoubtedly appears when he encounters the vast and complex problem of human knowledge in its organic unity, and when he is obliged to recognize the need for philosophy as an additional inquiry to that within the scope of any one, or all, of the special sciences.

In the inscription on his tomb Locke refers to his printed works as the truo representation of what he really was. They are concerned with SOCIAL POLITY, CHRISTIANITY, EDUCATION, and PHILOSOPHY. It may be convenient to arrange them under these four heads, in the order in which they were published, and then to give some account of his opinions under each head.

I. SOCIAL POLITY.—(1) *Epistola de Tolerantia*, 1689, (translated into English in the same year). (2) *Two Treatises on Government*, 1690 (the *Patriarcha* of Filmer, to which the *First Treatise* was a reply, appeared in 1680). (3) *A Second Letter concerning Toleration*, 1690. (4) *Some Considerations on the Consequence of Lowering the Rate of Interest and Raising the Value of Money*, 1691. (5) *A Third Letter for Toleration*, 1692. (6) *Short Observations on a printed paper entitled, "For Encouraging the Coining of Silver Money in England, and after for Keeping it here,"* 1695. (7) *Further Considerations concerning Raising the Value of Money*, 1695 (this was occasioned by a *Report* containing an "Essay for the Amendment of Silver Coins," published that year by William Lowndes, a secretary for the Treasury; Locke anticipates some later views in political economy). (8) *A Fourth Letter for Toleration*, 1706 (posthumous).

II. CHRISTIANITY.—(1) *The Reasonableness of Christianity as delivered in the Scriptures*, 1695. (2) *A Vindication of the Reasonableness of Christianity from Mr. Edwards's Reflections*, 1695. (3) *A Second Vindication of the Reasonableness of Christianity*, 1697. (4) *A Paraphrase and Notes on the Epistles of St. Paul to the Galatians, First and Second Corinthians, Romans, and Ephesians. To which is prefixed an Essay for the understanding of St. Paul's Epistles by consulting St. Paul himself*, 1705–7 (posthumous).

III. EDUCATION.—(1) *Some Thonghts concerning Education*, 1693. (2) *The Conduct of the Understanding*, 1706 (posthumous). (3) *Some Thoughts concerning Reading and Study for a Gentleman*, 1706 (posthumous). (4) *Instructions for the Conduct of a Young Gentleman*, 1706 (posthumous). (5) *Of Study* (written in France in Locke's journal, and published in L. King's *Life of Locke* in 1830).

IV. PHILOSOPHY.—(1) *An Essay concerning Human Understanding*, in four books, 1690. (2) *A Letter to the Bishop of Worcester concerning some passages relating to Mr. Locke's Essay of Human Understanding in a late Discourse of his Lordship's in Vindication of the Trinity*, 1697. (3) *Mr. Locke's Reply to the Bishop of Worcester's Answer to his Letter*, 1697. (4) *Mr. Locke's Reply to the Bishop of Worcester's Answer to his Second Letter*, 1699. (5) *A Discourse of Miracles*, 1706 (posthumous). (6) *An Examination of Father Malebranche's opinion of Seeing all Things in God*, 1706 (posthumous). (7) *Remarks upon Some of Mr. Norris's Books, wherein he asserts Father Malebranche's opinion of Seeing all Things in God*, 1720 (posthumous).

The following are Miscellaneous Tracts:—(1) *A New Method of a Common Place Book*, 1686 (this was Locke's first article in the *Bibliothèque* of Le Clerc; his other contributions to it are uncertain, except the *Epitome of the Essay*, in 1688). (2) *The Fundamental Constitutions of Carolina* (prepared when Locke was Lord Shaftesbury's secretary at Exeter House about 1673; remarkable for its recognition of the principle of toleration, and published in 1706, in the posthumous collection). (3) *Memoirs relating to the Life of Anthony, First Earl of Shaftesbury*, 1706. (4) *Elements of Natural Philosophy*, 1706. (5) *Observations upon the Growth and Culture of Vines and Olives*, 1706. (6) *Rules of a Society which met once a Week, for their improvement in Useful Knowledge, and for the promotion of Truth and Christian Charity*, 1706. (7) *A Letter from a Person of Quality to his Friend in the Country*, published in 1875 (included by Des Maizeaux in his *Collection of Several Pieces of Mr. John Locke's*, 1720), and soon afterwards burned by the common hangman by orders from the House of Lords, was disavowed by Locke himself. It may have been dictated by Shaftesbury.

There are also various writings of Locke first published in the biographies of Lord Haig and of Mr. Fox Bourne.

Locke's numerous *Letters* to Thoynard, Limborch, Le Clerc, Guenellon, Molyneux, Collins, Sir Isaac Newton, the first and the third Lord Shaftesbury, Lords Peterborough and Pembroke, Clarke of Chipley, and others, many of them unpublished, are models in their kind. They express the courtesy and humor which were natural to him, and his varied interests in human life. Those to Molyneux and Limborch in particular throw light on the *Essay*, and his works on Toleration and Christianity.

I. It has been truly said that all Locke's writings, even the *Essay on Human Understanding* itself, were "occasional, and intended directly to counteract the enemies of reason and freedom in his own age." This is obviously true of his works on Social Polity written in an age when the principles of democracy and toleration were struggling with passive obedience and divine right of kings, and when even "the popular assertors of public liberty were the greatest engrossers of it too." The state with Locke was the issue of free contract, and was not a natural organism. That the people, in the exercise of their sovereignty, have the right to govern themselves in the way they judge expedient for the common good, and that the civil government, whatever form it assumes, has no right to interfere with religious beliefs not expressed in actions inconsistent with civil society, is the essence of his political philosophy. He based the ultimate sovereignty of the people on a virtual consent or contract on the part of the people themselves to be so governed. The precise terms of contract, he allowed, might and should be modified by the sovereign people from time to time, in accommodation to ever changing circumstances. He saw that things in this world were in so constant a flux that no society long remained in the same state, and that "the grossest absurdities" must be the issue of "following custom when reason has left the custom." With an English love of compromise in the working of political affairs, he was always disposed towards liberal ecclesiastical concessions for the sake of religious unity and peace, and recommended obedience to the civil magistrate in all indifferent things in worship and government, not otherwise expressly determined by supernatural revelation.

His attack on Sir Robert Filmer in the *First Treatise on Government* was an anachronism, even when it was published; in the democratic principle argued for in the *Second Treatise*, while in advance of the practice of his age, he was anticipated by Aquinas and Bodin, as well as by Grotius and Hooker. His philosophical defence of the social rights of religious beliefs was the most original and important of his contributions to polity, and the most far-reaching in its ultimate assumptions. Locke had a more modest estimate of human resources, natural and supernatural, for forming true judgments in religion, and a less pronounced judgment of the immorality of religious error, than either the Catholic or the Puritan. The toleration which he spent his life in arguing for meant a revolution from the absolute to a relative point of view in the theory of knowledge. It was a protest against those who in theology "peremptorily require demonstration, and demand certainty where probability only is to be had." The practice of universal toleration amidst increasing religious differences was the most important application to the circumstances of his own age of the theory about human knowledge which pervaded his *Essay*. This paradox is now a commonplace, and the superabundant argument and irony in the *Letters on Toleration* fatigue the modern reader. The change of opinion is more due to Locke himself than to any one else. The rights of free thought and liberty of conscience had indeed been pleaded for, on various grounds, throughout the century in which he lived. Chillingworth, Jeremy Taylor, Cudworth, Glanvill, and other philosophical thinkers in the Church of England urged toleration in the state, in conjunction with a wide comprehension in the church, on grounds which implied intellectual limitation and even uncertainty in religious matters. Puritan Independents and Baptists, like Owen, Goodwin, and Richardson, whose idea of ecclesiastical comprehension was dogmatic and narrow, were

ready to accept sectarian variety within the state, on the ground that it was possible to have many religions in the land, but only their owu form within their sect. The existence of separate Christian nationalities, on the other hand, was the only justification of separate religious societies to the latitudinarian churchmen with whom Locke associated; iu each nationality they would have a comprehensivo church coextensive with the nation. Locke went far to unite in a higher prineiple what was best in the broad Anglican and in the Puritan theories, while he recognized the individual liberty which has ever distinguished the national church of England. (*a*) Iu his reasonings for toleration he insists on the fact that all human theologies must consist moro of beliefs determined on presumptions of probability thau of knowledge founded on what is either self-evident or demonstrablo in the light of reason. A profound sense of the limits of human reason was at tho bottom of his arguments for a tolerant comprehensiou by the stato and also by the church. He had no objections to a national establishment of some form of religion, provided it was comprehensive enough, and was really tho nation organized to promote goodness, aud not to proteet the metaphysieal subtleties by which professional theologians spoil the original simplicity of Christiauity. The recall of the national religion to this primitive simplicity, he hoped, would make toleration of nonconformists unnecessary, as few would then remain to ask for it. (*b*) The speculative, and therefore iudividually and socially harmless, nature of most persecuted beliefs and forms of worship is another point on whieh he insists. "No man is hurt becauso his neighbor is of a different religion from his own, and no civil society is hurt because its members are of differeut religions from one another." The more various our beliefs are, the more probable it becomes that a complete view of truth may by degrees be reached at last by the humau race. Iu the meantime beliefs in religion conceru tho individual only and not society. To the atheist alono Locke absolutely refuses toleration, on the ground that the social bonds can have no hold over him, for "the taking away of God dissolves all." If atheism means tho denial that reason is the ultimate regulative principle in tho universe, then the eonsistent atheist without doubt "dissolves all," and must reject physical scienee even, as well as morality, in an absolute nescience, so that he is iueapable of citizenship as one who is insane. In Locke's own philosophy, as we shall see, the existence of God is represeuted as demonstrable, but the distiuctive articles of Christianity are founded only on presumptions of probability. Ho argued too against full toleration to the Church of Rome, at least in the circumstances of the age in which the Toleration Act was passed, on the ground of its allegianee to a foreign sovereigu. (*c*) The unfitness of force as a means of sending the light of truth into a human mind is a third argument urged by Locke, founded on the psychology of human understauding. Persecution can only transform a man into a hypocrito; belief must be formed by individual discernmeut of evidence. Apart from evidence, a mau cannot command his own understanding; he canuot determine arbitrarily what opinious he is to hold. Thus all Locke's pleas for a universal toleration resolve at last iuto a philosophical view of the limits and origin of knowledge.

II. The principles which determined Locke's soeial polity largely determined his way of looking at Christianity. His "latitudiuarianism" was really the result of an extraordinary reverenee for truth, aud of his perception that in matters of religion knowledge may be sufficient for practice while it falls far short of perfection aud demonstration. He insists on referring questions in religion to the reasoniug iudividual, and never loses sight of the essential reasonableness of Christianity as tho only ground on which it can rest. Locke accepted the Scripture as infallible with the reverenee of a Puritan, but he did not, like so mauy Puritans, mean only Scripture as interpreted by himself. Coufidence in Biblical infallibility was also combined in Locke with a distrust in tho pretensions of "enthusiasm," which predisposed him to regard miracles as a eriterion needed for distinguishiug reasonable religious convictions from mere "inclinatious, fancies, aud strong assurances." Assent in religion as in everythiug else he could only justify on the grounds of its evideut rationality; "illumination without search, and certainty without proof and without examinatiou," was to him a sign of the absence of the divine spirit. Fanatical confidence that we are right, he would say, is no proof that we are right; when God makes us assent to tho truth of a proposition in religion, he either discovers to us its intrinsic rationality by the ordinary means of scientific insight, or offers miraculous signs, of the existenee of which we must have sufficiently probablo presumption. Reasonableness somehow must at last be our guide. His own faith in Christianity rested on its moral exeellence when it is rightly understood in its primitivo simplieity, and on the extraordinary signs in nature which he believed to have accompanied its first promulgation. "Even in those books which have the greatest proof of revelation from God, and the attestation of miraeles to confirm their being so, the miracles," he says, "are to be judged by the doctrine, and not the doctrino by the miracles." All this sort of argument became eommonplace in books about the "evidences" in the 18th century. The *Reasonableness of Christianity* was an attempt to recall religion from vorbal reasonings of theologieal schools, destructive of peace among Christians, to its original simplicity, but it no doubt involved an abatement of its transcendent mystery and ultimate incomprehensibility. The book was probably written to promote a comprehension of the dissenters. All who practieally acknowledge the supremacy of Jesus as the Messiah accept all that is essential to the Christianity of Locke, whatever other theological opiuions they may individually or collectively add to this only catholic ono.

Christian teachers aud apologists in the suceeeding age, as well as the assailants of Christianity, alike appealed to the *Essay on Human Understanding*, and the eatholic tradition of Angliean theology was thus iuterrupted in the church for more than a hundred years. His owu Christian belief, siucere and earnest, was more the outcome of the sort of common senso sagaeity which through him moulded the prudential theology of England in the 18th century, than of the nobler elements present in More, Cudworth, and other religious philosophers of the preeeding age, or afterwards in Law and Berkeley, Coleridge and Schleiermacher.

III. Locke takes his place in the succession of great writers on the theory and art of Education. His eduea-tional writings might be regarded either as an immediate introduction to or as an application of the *Essay on Human Understanding*. In his *Thoughts on Education* imaginative sentiment is never allowed to weigh against prudential utilitarianism; information aud mere learning are subordinated to the formation of character and practical wisdom; the part which habit plays in individuals is always kept in vicw; the dependence of eonscious mind, which it is the purpose of education to improve, upon the health of the eorporeal organism is steadily inculcated; to make those happy who are undergoing education is a favorite precept; accumulating facts in the memory without using the power to think, and without accustoming the youthful mind to apply reason to the evidenee by which individual thoughts must be tested, is always referred to as the eardinal vice in teaching. Wisdom more than learning is what he requires in the teacher. In tho knowledgo to be communieated he gives the first plaee to "that which may direct us to heaven," and the second to "the study of prudenee, or discreet couduct aud management of ourselves in the several oecurrenees of our lives," whieh most assists our "quiet prosperous passago through this present life." The infinity of knowable existence in contrast with the narrowuess of human understauding and experience is always in his thoughts. This "disproportionateness" is one reason given for due deliberation in the choice of studies, and for deelining those which lie out of the way of a really wise man, however much they may have been favored by custom. Among theso last he warns especially against "that mazo of words and phrases which have been employed only to instruct and amuse people in the art of disputing, and which will be found perhaps, when looked into, to have little or no meaning, . . . words being of no value nor use but as they are the signs of things; when they stand for nothing they are less than ciphers, for instead of augmenting the value of those they are joined with, they lessen it and make it nothing." Knowledge of what the opinions of other men have been is another study whieh Locke depreciates. "Truth needs no recommendation, and error is not mended by it; in our inquiry after knowledge it little coneerns us what other men have thought. . . . It is an idle and useless thing to make it one's business to study what have been other men's sentiments in matters where reason is only to be judge." Realism and individual rationality are two essential eduea-tional principles with Locke. In his *Conduct of the Understanding* the pupil is to be led to the point at which "a full view of all that relates to a questiou" is to be had, and at whieh alono a rational discernment of the truth is possible. The uneducated mass of mankind, on the contrary, either "seldom reason at all," or else "put passion in the place of reason," or "for want of large, sound round-about senso" they direct their minds only to one part of the evidence, "converse with but one sort of men, read but one sort of books, and will not come in the hearing of

but one sort of notions, and so carve out to themselves a little Goshen in the intellectual world, where light shines, and, as they conclude, day blesses them; but the rest of the vast *expansion* they give up to night and darkness, and avoid coming near it." It is a treatise on the wisdom needed for the management of the individual mind, so that it may overcome the *idola* or common tendencies to error against which Bacon had warned mankind. Hasty judgment, bias, or want of an *a priori* "indifference" to what evidence may require us to conclude, undue regard for authority or love for custom and antiquity, indolence and sceptical despair, are among the states of mind marked by him as most apt to interfere with the formation of our individual thoughts in harmony with the Universal Thought that is latent in nature. The development of vigorous intellect in each person is the aim of this admirable tract.

IV. The *Essay Concerning Human Understanding* contains Locke's Metaphysical Philosophy. It was the first attempt, on a great scale, and in the Baconian spirit, to show the certainty and inadequacy of human knowledge. This enterprise seemed to Locke to hold out the most reasonable hope of a solution of some sort for the perplexities which encompassed every department of inquiry.

The introduction to the *Essay* is the keynote to the whole. The ill fortune of mankind in their endeavors to comprehend themselves and their surroundings is there attributed to their disposition to extend their inquiries into matters beyond the reach of our intelligence, letting their thoughts wander into depths where we can have no footing. "Whereas, were the capacities of our understandings well considered, the extent of our knowledge once discovered, and the horizon found which sets the bounds between the enlightened and the dark parts of things, between what is and what is not comprehensible by us, men would perhaps with less scruple acquiesce in the avowed ignorance of the one, and employ their thoughts and discourse with more advantage and satisfaction on the other." To inquire into "the original, certainty, and extent of human knowledge, together with the grounds and degrees of belief, opinion, and dissent," is Locke's own account of the design of his *Essay*. He expressly excludes from his inquiry "the physical consideration of the mind,"—the natural causes (and, one might add, the transcendental reasons) for our conscious experience being what in his own "plain historical method" he might find it to be. He wanted to be able to make a faithful report, based on what he actually found, as to how far a merely human understanding of the universe can extend, to what extent human beings can share in pure knowledge, and "in what cases they can only judge and guess" on grounds of probability. Although his report might show that the knowledge attainable by the individual must be "narrow," and far short of a "universal or perfect comprehension of whatsoever is," it might also convince us that it is "sufficient," because "suited to our individual state." The "light of reason," the "candle of the Lord" that is set up in us, "shines bright enough for all our purposes. If we will disbelieve everything because we cannot certainly know all things, we shall do much as wisely as he who would not use his legs, but sit still and perish because he had no wings to fly." Locke thus opens his *Essay* in a tone which, with a more homely cheerfulness, reminds one in parts of the sublime conceptions of Pascal, and in others of the wise moderation of Bishop Butler. The outcome is that, if it should turn out on investigation that human understanding cannot solve the metaphysical problem of the universe, we may at least find that at no stage of our individual existence are we the sport of chance or of an evil power,—that there is a way by which we can secure our final wellbeing, even within the inexorable causal connections, conditioned by space and time, with their imperfectly calculable issues, by which we are environed.

The fourth book alone is concerned directly with the professed design of the *Essay*. It has been suggested by Stewart that Locke may have commenced with this book, especially as it contains few references to preceding parts of the *Essay*, so that "it might have been published separately without being less intelligible than it is." The inquiries in the preceding books are of a more abstract and scholastic nature, which probably opened gradually on his mind as he studied his subject more closely. The second and third books both relate to our individual ideas or thoughts. That each person has thoughts, and that without thoughts or consciousnesses there could be no knowledge for him, is Locke's postulate. This, he presumes, "will be easily granted;" for "every one is conscious of ideas in himself, and men's words and actions will satisfy him that they are in others." Questions about knowledge and its extent therefore presuppose questions about ideas or thoughts. But our mere ideas are, as Locke reminds us, "neither true nor false, being nothing but bare appearances in our own minds." Truth and falsehood belong only to the assertions or denials of the mind. The idea of a centaur has no more falsehood in it, when it appears in our minds, than the name centaur has falsehood in it when it is pronounced by our mouths, or written on paper. Truth and falsehood lie always in affirmations or negations, and the mere thoughts of which as individuals we happen to be conscious are not *per se* either true or false. They do not become either real knowledge or error "till the mind affirms or denies something of them."

That none of our knowledge is "innate" is the conclusion argued for in the First Book. But the drift of this famous argument has been overlooked by Locke's critics. It has been criticised as if it was a metaphysical discussion about the existence of transcendental elements in human knowledge, like that at issue in the present day between empiricism and intellectualism. If it were so it would be an example of the fallacy of irrelevant conclusion. For this Locke himself is no doubt partly responsible. It is not easy to determine who or what he had in view in this polemic. Lord Herbert alone is made prominent as the defender of innateness, and Locke was perhaps too little read in the literature of ancient and modern philosophy to do full justice to those who, from Plato downwards, have recognized the intuitions of reason as well as the phenomena of sense in the constitution of knowledge. The positions which he assails would have been disclaimed by the most eminent defenders of the transcendental elements. "Innate," as Lord Shaftesbury says, "is a word Mr. Locke poorly plays on,"—at least if he is to be understood as engaged in an intellectual struggle against Plato or Descartes. "The right word, though less used, is *connatural*. For what has birth, or the progress of the fœtus, to do in this case?" The real question, as Shaftesbury adds, is not about the time when the supposed innate knowledge entered, but "whether the constitution of man be such that, being adult and grown up, the ideas of (rational) order and administration of a God will not infallibly and necessarily spring up in him." But this Locke himself does not deny. "That there are certain propositions," we find him saying, "which, though the soul from the beginning, or when a man is born, does not know, yet, by assistance from the outward senses, and the help of some previous cultivation, it may afterwards come certainly to know the truth of, is no more than what I have affirmed in my first book" (see "Epistle to Reader," in second edition). This further appears from the fact that, although the *Essay* opens with an attack on innateness in human knowledge, yet the self-evidence, in the light of educated reason, of much that we know is asserted elsewhere not less strenuously. Much of our knowledge he reports in the fourth book to be reached by purely rational insight and demonstration. What he really argues against in the first book is that any of it should be supposed to have a claim to protection against a free criticism of its reasonableness. He argues there against the innateness of our knowledge of God and of morality; yet in the fourth book he reports, as a result of his search into our rational consciousness, in the "plain historical method," that the existence of God is a demonstrable rational conclusion, involved in that causal necessity without which there could be no knowledge at all; and he maintains in various places that morality may be found to be as demonstrably necessary as mathematics. The two positions are quite consistent. The demonstrable rational necessity of these and other sorts of knowledge often remains latent, he might say, in the share of reason that is potentially present in individuals, and therefore cannot be called "innate" knowledge; but, for all that, such truths "carry their own evidence along with them" in every mind that is rationally awake. Even in the first book he appeals to what might be called common reason, which he calls "common sense." "He would be thought void of common sense who asked, on the one side, or, on the other, went to give a reason, why 'it is impossible for the same thing to be and not to be.' It carries its own light and evidence with it, and needs no other proof; he that understands the terms assents to it for its own sake, or else nothing else will ever be able to prevail with him to do it" (bk. i. chap. 3, § 4). The truth is neither Locke nor the intellectualists of the 17th century expressed their meaning with enough of precision; if they had, Locke's first book would probably have taken a form more consistent with its true intention. It is really to be read as an energetic argumentative protest against anything in human knowledge being supposed to be independent of rational criticism. Locke believed that in attacking innate principles he was really substituting conscious self-evidence and rational demonstration instead of blind repose on authority, and was thus, as he says him-

self, not "pulling up the foundations of knowledge," but "laying those foundations surer." Truth is to be found in "the contemplation of things themselves," that is, by actual rational insight on the part of each individual. But when men heard of "some general propositions that could not be doubted as soon as understood," it was a short and easy way to conclude that such propositions are "innate," and that a personal perception of their rational self-evidence is unnecessary. This being once received, "it eased the lazy from the pains of search, and stopped the inquiry of the doubtful concerning all that was once styled innate." Dogmas became protected against rational criticism. "It was no small advantage to those who affected to be masters and teachers to make this the principle of principles—that principles must not be questioned." The mere assumption that they are "innate" was enough "to take men off the use of their own reason and judgment, and to put them upon believing and taking upon trust without further examination. . . . Nor is it a small power it gives a man over another to have the authority to make a man swallow that for an innate principle which may serve his purpose who teacheth them" (bk. i. chap. 4, § 24). Locke's examination of the way in which the rational consciousness of self-evident truths is actually reached refers them to "the being of things themselves duly considered, and to the application of those faculties that are fitted to receive and judge of them when duly employed." Thus the reasoning which runs through the first book is a return, in a more general and therefore more philosophical way, to that defence of individual rational insight against blind dependence on authority which was offered in the *Letters on Toleration*.

The Second Book opens with the suggestion of a general proposition regarding the genesis and constitution of ideas or thoughts; it closes after a labored endeavor to verify it. This hypothetical proposition is that all human thoughts, even the most complex and abstract, are due to "experience." If so, the significance of all abstract words, and the objective truth of all individual thoughts, must be tested by the elements of which "experience" consists, and cannot in any instance claim protection against this test.

The important point is what "experience" consists of. Locke says that it all comes either from external sources or from the mind itself; and he promises to show that even our most abstract thoughts, which seem to reach to infinity, may be traced to one or other or both of these constituents. In his own words, our most "complex ideas" are all made up of "simple ideas," either from without or from the mind; they are due to phenomena of which we are percipient in the five senses, or else due to reflection upon "the operations of mind." The "verification" of this position, in the central chapters of the second book, is to the effect that even those thoughts which are "most abstruse, how remote soever they may seem from sense, or from any operations of our minds, are yet only such as the understanding frames to itself by repeating and joining together ideas that it had either from objects of sense, or from its own operations about objects of sense,"—so that even large and abstract ideas are derived from one or other of the two sources (bk. ii. chap. 12, § 8). For this purpose our thoughts of space, time, infinity, power, substance, personal identity, causality, and several others which "seem most remote from the supposed original," are examined one after another, in the "historical plain method," and their complex constitution is resolved into (*a*) perceptions of things external, through the five senses, or into (*b*) perceptions of operations of our own minds.

The source of experience which depends upon the five senses Locke calls *sensation*; the other, through which mind is reflectively aware of its own operations, he calls *reflection*. This last, "though it be not sense, as having nothing to do with external objects," is yet, he says, "very like it, and might properly enough be called internal sense." The suggestion that "sense" might designate both the springs of experience is misleading, when we find in the sequel how much Locke tacitly credits "reflection" with,—in the way of rational tendencies and intellectual obligations; it may be objected to on grounds like those on which the somewhat analogous employment by Reid and others of "common sense" for common reason has been condemned. They both mean to say that we may call that "sense" in which reason *at once* carries the light of its own evidence, and does not even admit of external proof. Reason in its own evidence is thus analogous to what sense is popularly assumed to be. The elasticity of Locke's language in explaining his thesis makes the most opposite interpretations of the *Essay* possible, and all we can do is to compare one part with another, and in doubtful cases to give him the benefit of the doubt. His vacillation in the use of words is unfortunate. It was partly caused by a determination to avoid rigid technicality and pedantry. "Sensation" for instance is, in one definition, confined to "impressions or motions made in some part of the body which produce perceptions in the understanding" (bk. ii. 1, § 23); yet, when treated as one of the two springs of experience, it is made equivalent to what philosophers now call *sense-perception*, while "reflection" turns out to be another name for *self-consciousness*. Accordingly, although the second book is professedly limited to the examination of our ideas or thoughts only, it by implication makes the (provisional) assumption that the "ideas" of which we are conscious in "sensation" are at the same time to be regarded as "qualities" of sensible things which in some sort of way exist "without us," and also that the successive "operations" presented in "reflection" are those of an individual mind, presumed to exist somehow independently of them. Locke thus starts as a *common sense perceptionist*, and likewise relieves himself of the difficulty of having at the outset to show how the data abstracted by each sense are united in real things and persons. In order to make his theory work, he begins by assuming a *hypothetical duality* beneath phenomena,—some phenomena referable to external things, others referable to the conscious self,—and in fact confesses that this dual experience is *the* ultimate fact, the denial of which would make it impossible to speak about the growth and constitution of our thoughts.

In the early chapters of the second book, the "simple" thoughts into which he promises to resolve all possible "complex" ones are arranged in classes. Some of them, he reports, are conditioned "by one sense only," as colors by sight, or heat, cold, and solidity by touch; others "by more senses than one," as space or extension and motion, which are perceivable both by the eyes and by touch; a third class are got from reflection only, when "the mind turns its view inward upon itself," and by this means we get our ideas of perception or thinking itself, and also of willing, as well as the "modes of these two," such as remembrance, discerning, reasoning, knowledge, faith, etc.; lastly, there are simple ideas which we have both from sensation and reflection, for instance, our thoughts of bodily and mental pleasures and pains, as well as thoughts of existence, unity, power, and succession. Such, according to Locke, are the elements of the sublimest human thoughts. While the mind is becoming gradually stored with simple ideas like these (which are, however, somehow complex for us, when we "are conscious of them"), we find a growing power to elaborate them for ourselves at pleasure in an almost infinite variety; we are in fact obliged to do this in our tentative endeavors inductively to bring the thoughts of our individual minds into harmony with the actual complexity of thought that is presented to us in the order of nature. "But it is not in the power of the most exalted wit or enlarged understanding to invent or frame any new simple idea not taken in in one or other of these two ways,"—in proof of which Locke would have any one try to fancy any taste which had never affected his palate, or to frame the thought of a scent he had never smelt; and when he can do this he is ready to concede that a born blind man has ideas of colors, and a born deaf man notions of sounds.

The contrast and correlation of these two fountains of individual experience is suggested in the eighth chapter of this book, on the "qualities" of matter, in which we are introduced to a noteworthy vein of speculation running through the *Essay*. A chapter on "qualities of things" looks like an interpolation in an examination of our individual thoughts; its relevancy appears when we remember Locke's provisional hypothesis, according to which simple ideas of sense may also be viewed as qualities of things. Now, our original sense-thoughts are, we find, partly revelations of *external things themselves* in their essential externality or extension, and partly *sensations*, boundless in their variety, which are somehow raised in us through contact with the things. Locke calls the former primary, original, or essential qualities of matter, and the others its secondary or derived qualities. The primary, which involve mathematical relations, and might be called quantities rather than qualities, are inseparable from matter as matter, and somehow exactly correspond, he reports, to the thoughts we have of them. On the other hand, there is nothing in the mathematical relations of space-occupying body which in the least resembles our ideas or thoughts of the secondary qualities; they are qualities of bodies at all, rather than sensations in us, only in so far as our different secondary sensations somehow correlate with (unknown) sizes, shapes, and motions of the primary particles, with which they are thus in an established harmony. Therefore, if there were no sentient and intelligent beings in existence, the secondary qualities would cease to exist,—except perhaps as unknown modes of the primary, or, if not, as "something still more obscure." On the other hand, "solidity, extension, figure, motion, and rest would be

really in the world as they are, whether there were any sensible being to perceive them or not" (bk. ii. chap. 21, § 2). The outcome of what Locke teaches about the mutual relations of matter (*a*) known as occupied-space, and (*b*) known in and through the sensations caused by secondary or relative qualities, is that it is something capable of being expressed at once in terms of mathematical quantity or extension, and also in terms of sense-consciousness. A further step would have led to the conception of the correlative dependence of all the so-called qualities of bodies upon "the bulk, figures, number, situation, and motions of the solid parts of which they consist," and which "exist as we think of them whether or not they are perceived." The true conception of an individual body would then be a conception of the actual mathematical relations of the atoms of which it consists, regarded as the established "occasions" of the sensations of color, resistance, sound, taste, or smell which we refer to it as qualities; and also of the changes that it occasions in the atoms of which other individual bodies consist, which are followed by *their* operating on sentient beings differently from what they did before, as when the sun melts wax. But Locke only suggests in a hesitating way that the powers of bodies which are manifested in sensible changes *may* be conditioned by unknown changes in the mathematical relations of their insensible atoms, or, if not thus dependent upon them, conditioned by "something yet more remote from our comprehension." For, not knowing what size, figure, and texture of parts they are on which depend and from which result those qualities which make our complex idea, for example, of gold, "it is impossible *we* should know what other qualities result from, or are incompatible with, the same constitution of the insensible parts of gold, and so consequently must always coexist with that complex idea we have of it, or else are inconsistent with it."

Some of the most remarkable chapters in the second book are those which relate to the verification of its initial proposition. They carry us towards the metaphysical mysteries which so attract meditative minds. The hypothesis that our most complex thoughts are all resolvable into "experience" is tested in these chapters by the *modes* or *modifications*, and *substantiations*, and *relations* which, in various degrees of complexity, we find ourselves somehow obliged to make the simple phenomenal thoughts of sense and reflection undergo. Such, for instance, are the thoughts of finite quantity in space and time and number, in which Locke reports that we find ourselves mentally impelled towards immensity, eternity, and the innumerable, that is to say, towards Infinity, which transcends quantity; the complex thought of Substance, towards which he reports that we find ourselves impelled in another of the "operations of our minds," when the simple phenomena of the senses have to be regarded as powers or qualities of "something;" the thought of the Identity of individuals, involved in the apparently inconsistent idea of their constant phenomenal changes; and, above all, the mental tendency we find we somehow have to suppose what we call a "Cause" whenever we observe a change. Let us see how Locke deals with these crucial instances.

He dwells much on our ideas of Space, Succession, and Number. The first he says begins to appear when we use our senses of sight and touch; the second he finds "suggested" by all the phenomena of sense, but still more by "what passes in our minds;" the third is "suggested by every object of our senses, and every thought of our minds, by everything that either doth exist or can be imagined." The modifications of which these three sorts of simple ideas are susceptible he reports to be "inexhaustible and truly infinite, extension alone affording a boundless field to the mathematicians." In his own patient judicial way, he finds many curious analogies between space and time. Neither is limited by the world of individual things. We can imagine space without bodies, but we cannot perceive or imagine bodies without space. Places and periods are all relative to objects and events, but both space and time are absolutely indivisible. A trinal space extends in all directions, while time has only one dimension. All things exist in the same present time, while no two things occupy the same space. The parts of time cannot be thought to coexist; the parts of space cannot be thought to succeed one another. Whether the thought of unoccupied space is the thought of a substance or of an attribute Locke professes that he cannot tell, at least till they that ask show him "a clear distinct idea of substance."—But the real mystery which he has to report of these thoughts of space and time is that "something in the mind" hinders us from imagining any limit to either. We find ourselves, when we try, obliged to lose our positive thought of space in the negative thought of Immensity, and our positive thought of time in the negative thought of Eternity. We have never seen, and we cannot mentally imagine, an object whose extent is boundless. Yet we find when we reflect that there is an "operation of the mind" which somehow forces us to think that space and time *have no limits*. "I would fain meet with that thinking man that *can* in his thoughts set any bounds to space more than he can to duration" (§ 21). Thus Locke by implication acknowledges something added by the mind to the originally presented "simple ideas" of extension and succession, though he explains that what is added is not positively imaginable. When we reflect on our thoughts of immensity and eternity, we find them to be thoughts, yet negations of all imaginable thought; and that whether we proceed by addition or by division. He characteristically accepts the fact; he does not inquire *why* mind should find itself thus obliged to add without limit, and to divide without limit. He simply reports that immensity and eternity *are* inevitable negative ideas, and that every endeavor to transform them into positive or imaginable ones only issues in the contradictory attempt to represent as a bounded quantity what is really infinite or beyond quantity. The idea of the infinite, or unquantifiable in extent and in succession, has so far, he finds, "something that is resolvable into the simple positive ideas of space and time." For, when we try to think of the infinite in space or duration, we at first usually make some very large idea (imaginable in itself, though by men unimagiuable), as perhaps of millions of miles or ages, which possibly we multiply millions of millions of times. All that we thus amass in our thoughts is positive (*i. e.*, imaginable in its nature, although not imaginable by a human mind). But at the end of this we are as far from the infinite reality as we were at the beginning, so that what lies beyond the imaginable idea *towards* the infinite lies "in obscurity, and has the indeterminate confusion of a negative idea"—irresistible and incomprehensible.

Locke, with all his aversion to what is unrepresentable in forms of coexistence and succession, is too faithful to rational facts to overlook these mysterious elements of our rational experience. His integrity is also illustrated in his acknowledgment of the unimaginable, and in this sense incognizable, in our thought of Substance. He tries to phenomenalize it; but he finds that it cannot be phenomenalized, and yet that we cannot dispense with it. An unsubstantiated succession of phenomena, without a centre of unity to which they are referable, is unintelligible; we could not have a language consisting only of adjectives. Locke had an obscure apprehension of this intellectual obligation as a fact of rational consciousness. According to his report, "the operations of the mind" oblige us to suppose something beyond phenomena, to which as qualities phenomena must belong; but he was honestly perplexed by the "confused negative" thought of this "something," which was all that he could reach, and of which he says we "neither have nor can have any positive idea either by sensation or reflection." The word substance thus means "only an uncertain supposition of we know not what" (i. 4, § 18). All attempts to realize it is like the attempt to realize immensity or eternity, and we are involved in an endless—inevitable yet incomprehensible—regress. If one were to ask *what* the substance is in which this color and that taste and smelliug "inhere," and was told that they belong to the solid and extended parts, or primary qualities, of the thing, he must again ask what *their* substance is, and so on for ever. "He would be in a difficulty like the Indian, who, after saying that the world rested on an elephant, and the elephant on a broad-backed tortoise, could only suppose the tortoise to rest on 'something, *I know not what.*'" We must fail, in short, when we try either to phenomenalize our thought of substance or to dispense with it. He finds that our only positive complex ideas of substances are those in which we imagine an aggregate of attributes; it is only thus that we can rise to any positive thought even of God, in "the power we have of enlarging indefinitely some of the ideas we receive from sensation and reflection" (ii. 23, § 33). *Why* we must be in this strange mental predicament with regard to our thought of substance, Locke characteristically did not inquire. He reported the fact in his own "plain, historical way."

He struggled bravely to be faithful to facts in his report of the not unlike mental predicament in which we find ourselves when reflection awakens in us the conviction of our own Individuality and continued personal sameness. The paradoxes of expression in which he gets involved in the chapter on "personal identity" are evidence of this. He mixes the thought of our actual individual personality, given in our consciousness of something external to self, and above all in our moral experience of responsible agency, with the negative thought of the transcendental relation of substance, which, when we try to phenomenalize it, becomes "an uncertain supposition of we know not what."

But we must pass on to his report about our thoughts of Causality and Power, especially as his theory of real knowledge in the fourth book is very much an application of the principle of causality. The intellectual demand for the cause of an event is what we find we cannot help having, and yet it is a demand for what in the end we cannot grasp in a phenomenal representation. The causal thought in the form of power very much perplexed Locke, in his famed chapter on that idea (21); the perplexity is not so obvious in the sections on "cause and effect," in another chapter (26), where he considers only the circumstances in which this relational thought arises.

Locke traces the thought of "cause and effect" back to our "constant observation" that "qualities and finite substances begin to exist, and receive their existence" from other beings which produce them. Seeing, for instance, that, "in the substance which we call wax, *fluidity* is constantly produced by the application of a certain degree of heat, we somehow come to think of heat as the cause and fluidity as the effect." This is to report what happens in our minds when we observe a particular example of that causal connection which gives intelligibility to successive phenomena, converting them into the concatenated system which we call the universe. Through calculated observations we, in this way, learn that *this* is the cause of *that*, and that *such as this* is the cause of *such as that*. But Locke's words in the 26th chapter do not explain the rational need for this causal expectation. Anything, as far as "constant observation" tells us, might have been the cause of anything; no finite number of instances of an "observed" sequence—in the strict meaning of the term "observation"—can guarantee its universality. Elsewhere, indeed, he adds to this meagre account the important statement that "our clearest idea of power is got through our consciousness of our own voluntary agency, and therefore through reflection" (chap. 21). Bodily phenomena he there reports to be incapable of presenting originative agency, this being an idea which cannot be phenomenalized in external sense. In changes among bodies we observe no origination, but only phenomenal order—significant and therefore interpretable phenomena. The thought of the "production" of motions is connected with what we are conscious of when we exert volition. Locke here approaches the view of power afterwards taken by Berkeley, which was the constructive principle of Berkeleyan philosophy. But neither Locke nor Berkeley explains the transformation of our moral consciousness of ourselves, as free or originative, and therefore, to this extent, responsible agents, into the universal rational principle, on which both proceed in explaining our knowledge of the real existence of God and of the sensible world. Locke's language sometimes suggests that the transformation is made through an induction that is either instinctive or produced by custom. Now, not to say that every inductive generalization presupposes causal connection, the particular fact that this, that, or the other person, through his moral experience, finds *himself* a free cause, does not, consistently with inductive rules, warrant the *universal* conclusion that the phenomenal changes of the universe must all be referred to power like our own personal power. That we are somehow obliged to think a caused or phenomenal cause, and ultimately an uncaused or free agent, of every change—that we are obliged to view changes as events or issues from adequate productive causes into which they may be refunded—is vaguely accepted in the *Essay* as a fact of rational consciousness; but no explanation is given of its origin, only of the circumstances in which it arises in the individual mind. The inquisitive reader still asks why the individual mind is obliged to think back all changes into sufficient causes of which they are the issues, and why each set of antecedent phenomena, into which we thus refund new phenomena, themselves occasion a fresh intellectual demand for a preceding cause, while, after all, the mind is still left dissatisfied until it rests in a truly originative or unconditioned cause. And yet if the intellectual need for a phenomenal cause were withdrawn, there could be no rationality in, and therefore no reasoning possible about, Nature; for all the physical government of the universe depends upon it; and again, if uncaused or unconditioned power were withdrawn, there could be no moral responsibility or moral government. This sort of *reductio ad absurdum* of every merely empirical analysis of the causal thought into what is strictly observable was foreign to Locke. His aversion from mysticism may have made him pass slightly over the mystery of an experience that like ours is conditioned by relations of place, which lead to the unimaginable thought of Immensity, of succession, which lead to the unimaginable thought of Eternity, and of change, which lead to the unimaginable thoughts of Substance and Power.

Locke's book about our individual ideas or thoughts leads naturally to his Third Book, which is especially about those of them that are general and abstract, and their connection with language. It is here that he describes "abstract ideas;" here also he illustrates the confusion apt to be produced in our thoughts by the imperfections of language.

But we must pass on to the Fourth Book, about knowledge, which closes the *Essay*. Knowledge, he says, is perception or discernment of relations among our thoughts; real knowledge is discernment of their relations to what is objectively real. In his books about our "ideas" he had dealt with "simple apprehensions;" here he is concerned with "judgments" and "reasonings," and largely with judgments and reasonings about matters of fact. At the end of the long and patient research among our mere thoughts or simple apprehensions, he supposes his reader apt to complain that he has been "all this while only building a castle in the air," and to ask what the purpose is of all this stir about our thoughts, or our knowledge either, if we are not thereby carried beyond our own individual thoughts, and must accordingly regard our own fancies as the universe. "If it be true that knowledge lies only in the agreement or disagreement of our own ideas, the visions of an enthusiast and the reasonings of a sober man will be equally certain. It is no matter how things themselves are" (iv. 4, § 1). This is the keynote of the fourth book. It does not, however, carry him into an analysis of the rational constitution of knowledge as knowledge, as it would carry a transcendentalist of the 19th century, or even an associative philosopher. Transcendental analysis is too remote from human affairs to interest Locke. Hume, moreover, had not yet shown the difficulties which sceptical ingenuity could suggest against those facts of rational consciousness which Locke accepted without analysis. The sceptic who doubted the very constitution of reason and experience, because it could not be supported by external proof, was less in his view than minds blindly resting on authority or on irrational instincts. Universal scepticism like Hume's he would at any rate probably have regarded as a frivolous amusement, into which no human mind could permanently subside, and therefore unworthy of the serious attention of a wise man. What he wanted was to awaken a conscious conviction of principles apt to be dormant in the individual, but to which he believed a response must be given when reflection was called forth. He was careless as to how far these principles might be developed into a reasoned system of speculative philosophy. "Where we perceive the agreement or disagreement of any of our ideas there is *certain* knowledge; and wherever we are sure these ideas agree with the reality of things, there is certain *real* knowledge" (chap. 4, § 18). He is anxious throughout to show that a great deal of commonly supposed real knowledge is not entitled to be called "knowledge," and that it is merely presumption more or less probable. Instead of the immediate or the demonstrable insight, which alone is what he intends by knowledge, it is only "assent," "opinion," "probability,"

Locke's report about human knowledge and the narrow extent of it is contained in the first thirteen chapters of the fourth book. The remainder of the book is concerned for the most part with what he found when he examined instances of "assent" or reasonable presumption, so liable to error, but on which human life really turns, as he and Butler are fond of reminding all transcendentalists. He takes for granted that "all the knowledge we have or are capable of" must be discernment of one or other of four sorts of agreement or disagreement among our thoughts themselves, or between our individual thoughts and the reality that is independent of them. All that can be conceivably known must be either (*a*) relations of identity and difference in what we are conscious of, that, for instance, "blue is not yellow;" or (*b*) this thought being mathematically related to that, as, for instance, that "two triangles upon equal bases between two parallels must be equal;" or (*c*) that one quality does or does not coexist with another in the same substance, as that "iron is susceptible of magnetical impresssion;" or (*d*) that a thought has a real objective existence, independent of our individual mind, as that "God exists," or the "earth exists." What would now be called merely analytical knowledge exemplifies the first sort; mathematical (Locke would add moral) knowledge represents the second; physical and natural science, if this can become knowledge proper at all, would come under the third head; metaphysical knowledge forms the fourth. The third and several following chapters of this concluding book of the *Essay* are really an inquiry, under these four heads, how far knowledge is possible for man in mathematics, and in morality; about nature or natural phenomena in relations of coexistence and succession; and about the hyperphenomenal reality of

our own existence, the existence of God, and the existence of matter.

Locke found a difference among the examples of what "knowledge" is that were offered in his natural experience. In some instances the known relation was at once evident, as when he judged that a circle was not a triangle, or three more than two and equal to one and two. In other cases the known relation was perceived only through the medium of something else, as in a mathematical conclusion, in which each step is taken by a rational intuition. The former is rationally intuited and the latter rationally demonstrated knowledge. In strictness all knowledge or rational certainty, he would have it, is in one or other of these two kinds. There is, however, a third sort of certainty which rather puzzled him. He found that "our perceptions of the particular existence of finite beings without us" go beyond mere probability, although they are not examples of rational necessity. There is nothing contradictory to reason in the supposition that our sense-perceptions are illusory, although we are, in fact, incapable of doubting their reality. We find ourselves "inwardly conscious of a different sort of perception," when we look on the sun by day and only imagine the sun at night. This, which is Locke's third sort of knowledge, might be called sense-perception. The difficulty that a "sense-perception" only of the present moment, divorced from the past and the future, can be other than "blind," or irrational, does not occur to him.

Locke next inquired to what extent a human knowledge —in the way either of intuitive or demonstrative rationality, or of sense perception—is possible in regard to each of the four (already mentioned) sorts of knowable relation in which must be contained all knowledge we can be supposed capable of. Our knowledge must of course be confined within our "ideas;" for it is self-evident that we cannot have knowledge of a thing if consciousness is dormant. But there is only one of the four sorts of knowable relation in regard to which our knowledge is coextensive with our thoughts. The only knowable relation which he finds to be coextensive with his thoughts is that of "identity and diversity;" we cannot be conscious at all without distinguishing, and every affirmation implies negation. The second sort of knowable relation—purely rational concatenation among our thoughts—is intuitively and also demonstrably discernible in thoughts about quantities, in forms of space, time, and number; it is through this discernment that the mathematical sciences are constructed. Morality too, Locke thinks, as well as quantity, is capable of being thus rationalized. "Where there is no property there is no injustice," he offers as an example of a proposition "as certain as any demonstration in Euclid." Only we are more apt to be biassed, and thus to have reason withdrawn from us, in dealing with problems of morality than in dealing with those of mathematics. Mankind might in consequence, in questions of morals, "with Egyptian darkness expect Egyptian bondage, were not the candle of the Lord set up by himself in their minds" (ch. 4, § 20). It is not easy to say whether the mathematics and morality which Locke finds thus demonstrable would be, as understood by him, sciences of what Kantists call analytical judgments founded on arbitrary definitions, or sciences consisting of synthetical judgments *a priori*.

In turning from mathematical and moral relations to those of coexistence and succession among phenomena,—Locke's third sort of knowable relation,—he finds the light of pure reason disappear, although the relations in question are those in which "the greatest and most important part of what we desire to know" consists. Of relations of this third kind, with which all the physical and natural sciences are concerned, he reports that "our knowledge is very short, if indeed we have any at all," and are not wholly thrown on presumptions of greater or less probability, or even left in ignorance. According to the philosophy of the *Essay* "there can be no science of bodies." All physical and natural science depends on a knowledge of the relations between the secondary qualities and other powers of bodies on the one hand, and the primary or mathematical qualities of their atoms on the other, or else "on something yet more remote from our comprehension." Now, as a rational insight of these relations, either intuitively or through demonstration, is beyond our reach, we must be satisfied with inductive presumptions, which the completest "verification" leaves, after all, only presumptions that more facts might prove to be unwarranted. Our inductive generalizations about particular things must always involve an element of possible error, or at least inadequacy, and therefore of probability only. Arbitrariness of connection, and not rational necessity, reigns over the whole realm of physical government, with its relations of constant coexistence and succession; we only presume, as reasonably as we can, what its actually established laws are, and we can only presume that these laws are sustained in a steady and uniform government. The presumption is "sufficient for our purposes."

The amount of our knowledge under Locke's fourth category of knowable relations—those of real metaphysical or metaphenomenal existence—is reduced, in his report, to —(*a*) rational perception of our own individual existence as conscious persons; (*b*) the demonstrable rationality of the existence of God or Supreme Mind; and (*c*) sense-perception of the existence of particular objects—as long as, but only as long as, they are actually present in sense. That each individual person exists is manifested to himself in memory, and no certainty beyond that of each passing thought while it passes can be greater than this. "If I doubt all other things," says Locke, after Descartes, "that very doubt makes me perceive my own existence, and will not suffer me to doubt of that" (iv. 9, 3). The eternal existence of God or Supreme Reason is with Locke only another way of expressing the principle of causality and sufficient reason in its universality, as suggested by our conviction that our own personal existence had a beginning. Each individual person knows that he now exists, and is convinced that he once had a beginning; with not less intuitive certainty of reason he knows that "*nothing* can no more produce any real being than it can be equal to two right angles." The final rational conclusion is that there must be eternally "a most powerful and most knowing Being, in which, as the origin of all, must be contained all the perfections that can ever after exist," and out of which can come only what it has in itself, so that, as the adequate cause, it must involve mind. There is thus a rational necessity for Eternal Reason, or what we call God. He cautiously adds elsewhere, "Though I call the thinking faculty in me 'mind,' yet I cannot, because of that name, equal it in any thing to that infinite and incomprehensible Being which, for want of right and distinct conceptions, is called 'mind' also, or the eternal mind."

Turning from the metaphysics of religion to the metaphysics of matter, nearly—but perhaps not quite—all that one can affirm or deny about things external to us is, according to Locke, not knowledge but only presumptive trust. We have on the whole no knowledge of the real existence of anything other than our own individual existence, that of Universal Reason, and that of particular objects of sense—while, but only while, they are present to our senses. "When I see an external object at a distance, a man for instance, I cannot but be satisfied of his existence while I am looking at him. (Locke might have added that when one thus "sees a man" it is only his *visible* qualities that are perceived; for his other qualities are as little 'actual present sensations' as if he was out of the range of the senses altogether.) But when the man leaves me alone, I cannot be certain that he still exists. There is no necessary connection between his existence a minute since (when he was present to my sense of sight) and his existence now (when he is absent from all my senses); by a thousand ways he may have ceased to be. I have not that certainty of his continued existence which we call knowledge; though the great likelihood of it puts it past doubt. But this is but probability and not knowledge" (chap. 11, § 9). Either a rationally intuitive or a rationally demonstrative science of Nature is thus, according to Locke, impossible. A conception of the coexistences and successions of phenomena which form the external world being essentially the natural expression of the Universal Mind, and therefore capable of being reasoned about by our individual minds, in our gradual scientific progress towards agreement between the objective thought in nature and our subjective thoughts, was too speculative and mystical for Locke. He prefers to urge the matter-of-fact consideration that all our interpretations of nature can be only presumed probabilities—not purely rational certainties. For him the vast region of reality—beyond our immediate sense-perceptions, memory, and the demonstrably necessary causal connection with the Universal Mind—is either presumed probability, grounded on faith, or else it is within that veil which separates what is behind it from reasonable belief as well as from knowledge. And he even fails to explain how anything at all above the world of sense can be "known" in a sense-perception that is restricted to the transitory "actual present sensation" of each moment. No past events and no future events can be *known* in the strict meaning of "knowledge." It is unreasonable to demand a knowledge of more than abstract propositions and present momentary experiences. For the rest, we can only gradually convert beliefs into certainties that are absolute for all practical purposes. Such is the outcome of the *Essay*.

We might expect to learn from Locke something as to the rationale of the probable presumptions by which, as sup-

plementary to our limited knowledge of real existence, we pass beyond the narrow sphere within which that knowledge is confined, according to his report of it, and possess ourselves so far of the unperceived past, distant and future, in our experimental reasonings. He does little to satisfy us here. The concluding chaptors of the fourth book contain judicious advice for human beings, whose lives are passed in a world of probabilities and presumptions, for avoiding the consequent risks of error or misinterpretation in their reasonings about what they see,—with or without the help of syllogism, the function of which, as an organ of discovery, he criticises in the seventeenth chapter. Nothing is done to connect "probable" interpretations of the contingent phenomena of existence with the rational relations involved in the knowable part of its constitution, with which the preceding chapters were occupied.

This subject was resumed by Hume, very much at the point where Locke left it. With a still humbler view of the possible extent of human knowledge than Locke's, Hume proposed as a subject "worthy of curiosity," to inquire what is "the nature of that evidence which assures us of any real existence and matter of fact, beyond the present testimony of our senses and the records of our memory," remarking that "this part of philosophy has been little cultivated either by the ancients or the moderns." The result of the inquiry was his announcement that Custom and the associative tendencies are a sufficient practical explanation of the formation of our experience. All beyond each present transitory "impression" is connected with it, through "ideas," by means of Custom and Association. Hume's solvent, in the form either of individual or of inherited associative tendency, has since been made the philosophical explanation of all human experience in the Empirical Philosophy to which his *Inquiry* conducted. As for Locke, the "association of ideas"—either in the individual or as inherited—was not alluded to in the first edition of the *Essay*. The short chapter on the subject—now found at the end of the second book—was introduced in the second edition, not as in any way philosophically explanatory either of the thoughts or of the knowledge and probable beliefs of men, but as the chief source of human prejudices—as a cause of human errors against which men, dependent largely on probable presumptions, need in an especial manner to be warned. This useful chapter was an afterthought *caveat*, regarding a tendency which Locke saw was apt to spoil the "quality" of our individual thoughts,—apt, if one may put it so, to make them inconsistent with the Universal Thought latent in nature, by which our personal thoughts about what the laws in nature are must be tested.

On the other hand, an analysis like Kant's of what is abstractly implied in knowledge is even more foreign to the design of Locke, and to the tone of his philosophy, than the attempts of 18th and 19th century associationists and evolutionists to account for knowledge as if it were a fact of physical science. To show, in the case of any self-evident conception or judgment, that without it knowledge could not exist at all, would be to show what Locke took for granted for all the purposes he had in view. His aim was to determine to what extent experience, presumed to be rationally constituted, could come within the individual consciousness of man. On the one hand, to analyze in the abstract the rational constitution of knowledge, into which he found that man is able only very partially to subdue the universe, or, on the other hand, to seek for the physical causes of its (partial) realization in the human individual, were neither of them inquiries properly included in his enterprise.

Locke's function was to present to the philosophical mind of the modern world, in his own "historical plain method," the largest assortment ever made by any individual of the actual facts of sense consciousness and rational consciousness in man. The further investigation of these facts, in Germany on the Transcendental Method, in England and France on the Empirical Method, as well as, by Butler and Reid, in Locke's own Common Sense Method—all under the stimulus of Hume's sceptical analysis—has employed philosophers since the *Essay on Human Understanding* collected materials for speculation.

Literature.—The *Essay concerning Human Understanding*, which was thus the philosophy of Locke's own life, and also of the century which followed, has passed through more editions than any similar book of ancient or modern times. Before the middle of the 18th century it had reached a thirteenth, and it has now passed through some forty editions, besides being translated into Latin, French, Dutch, German, and modern Greek in various versions. There are also several abridgments, in which the attempt is made to remove some of its innumerable repetitions. A considerable philosophical library might be formed out of the criticisms and comments to which it has given rise in the last hundred and ninety years. In addition to those which appeared when Locke was alive, some of which are mentioned above, among the most important are Leibnitz's *Nouveaux Essais sur l'Entendement Humain*—written about 1700, and published in 1765, in which each chapter of the *Essay* of Locke is examined in a corresponding chapter; Cousin's "Ecole Sensualiste: Système de Locke," in his *Histoire de la Philosophie au XVIII. Siècle*, 1829; and the recent criticisms in Professor Green's Introduction to the *Philosophical Works of Hume*, 1874. The *Letters on Toleration*, *Thoughts on Education*, and *Reasonableness of Christianity* have also gone through many editions, and been translated into different languages. The first collected edition of Locke's *Works* was in 1714, in three folio volumes. The best edition is that by Bishop Law, in four quartos, 1777. The one most commonly known is in ten volumes, 1812. The *Essay*, as well as the other treatises, needs textual revision and critical annotation.

The *Éloge* of Le Clere (*Bibliothèque Choisie*, 1705) has been the basis of the memoirs of Locke prefixed to the successive editions of his *Works*, and contained in the biographical dictionaries. In 1830 a *Life of Locke*, in two volumes, was published by his descendant Lord King. This adds a good deal to what was previously known, as Lord King was able to draw from the mass of correspondence, journals, and commonplace books of Locke in his possession. In the same year Dr. Thomas Foster published some interesting letters from Locke to Benjamin Furley. The most copious account of the details of Locke's life is contained in the two volumes by Mr. Fox Bourne (1876), which are the results of laborious and faithful research in the Shaftesbury Papers, Locke MSS. in the British Museum, the Public Record Office, the Lambeth, Christ Church, and Bodleian libraries, and in the Remonstrants' library at Amsterdam. (A. C. F.)

LOCKHART, John Gibson (1794–1854), was born in the manse of Cambusnethan in Lanarkshire, where his father, Dr. Lockhart, was minister. His mother was daughter of the Rev. John Gibson, minister of St. Cuthbert's, Edinburgh. In 1796 his father was transferred to Glasgow, where John Lockhart was reared and educated. He derived his rare abilities from his mother, and his first regular teaching from the High School of Glasgow. He appears to have been from the first distinguished as a clever, but by no means industrious boy. Like most clever boys he read everything that came in his way; and what he had once devoured he never forgot; for his memory was so retentive that, in after life, like Macaulay and Sir George Lewis, he seldom found it necessary to verify a passage for quotation. No livelier boy than John Lockhart ever lived; in or out of school his sense of fun and humor, expressed in joke, sarcasm, and pencil caricatures, was irrepressible. At the same time, however merry and mischievous, he was a proud and reserved boy; and this was the side he mostly turned to the outer world as a man. The struggle between a very affectionate nature and a determination not to show his feelings, or perhaps an incapacity to give way to them, cost him dear. A younger brother and sister were carried off within a few days of each other. John appeared to bear the loss like a stoic, but he fell seriously ill, and had to be removed finally from the High School. On his recovery, though still under twelve years of age, he was entered at college, where he sketched the professor for the amusement of his companions, as he had sketched the masters before. When examination time came, he astonished all by a display of erudition, especially in Greek authors, of the acquisition of which he had given no signs; a Snell exhibition, just vacant at Oxford, was accordingly offered to him and accepted.

Lockhart was not turned fourteen when he was entered at Balliol College, but he soon asserted his character and his powers. His fun and satire made him at once popular and formidable, while beyond the regular studies of the place he acquired a great store of extra knowledge. He read French, Italian, German, and Spanish, was curious in classical and British antiquities, and well versed in heraldic and genealogical lore. Lockhart went up to the schools in the Easter term of 1813—not nineteen years of age—and, notwithstanding the most audacious employment of part of his time in caricaturing the examiners, he came out first in classics. The name of Henry Hart Milman, a subsequent friend through life, stood next his. For mathematics he never had the least inclination.

He now quitted Oxford, and before settling to the study of Scottish law, for which his father had designed him, he indulged a long cherished wish to visit Germany. His knowledge of German had introduced him to the great band of poets and scholars who had suddenly exalted the fame of German literature. Lock-

hart had no means to undertake the journey; but here his reputation came to his aid. A proposal to translate Frederick Schlegel's *Lectures on the Study of History* was accepted by Mr. Blackwood, and the price of the labor paid before a line was written. Lockhart always spoke of this as a most generous act on "Ebony's" part, and his friendship with the liberal publisher lasted through life. He meanwhile paid his visit to Germany, was introduced to Goethe at Weimar, traversed France and the Netherlands, made careful observations on pictures and architecture, and returned to Edinburgh to study law by the time he was twenty-one. In 1816 he was called to the bar. But he had no friends among writers and attorneys, his brilliant powers of conversation did not comprise that of public speaking, and few, if any, briefs came in. His habits of observation, however, turned the time to a use afterwards exemplified in *Peter's Letters*.

Edinburgh was then the stronghold of the Whig party. The *Edinburgh Review* was their organ, and it was not till 1817 that the Scotch Tories found a national channel of assertion and defence—namely, in *Blackwood's Magazine*. This periodical held its way dully enough with its first numbers, when suddenly an outburst of wit and ridicule directed against the hitherto unchallenged writers of the Whig party, surpassing them in cleverness and equalling them in personalities, electrified the Edinburgh world. Wilson (Christopher North), Hogg (the Ettrick Shepherd), and Lockhart had joined the staff, and retaliation for long pent-up wrongs began. Lockhart's pen contributed scholarly papers on various subjects, including hearty criticism and eulogium on Coleridge, Wordsworth, and other victims of a *Review* which could find only scant praise even for Walter Scott. His translations also of the Spanish ballads appeared for the greater part in *Blackwood*. But his pen was more often dipped in caustic, dealing out attacks and recriminations which led to regretable consequences. Meanwhile the gifted and handsome young man, for Lockhart's head was cast in the highest type of brilliant manly beauty, had attracted the notice of Walter Scott. They met first in 1818. The acquaintance soon ripened into friendship, and that friendship led to the union between Lockhart and Scott's eldest daughter, Sophia, in April, 1820. For more than five years after his marriage Lockhart tasted the best form of domestic happiness. Winters spent in Edinburgh and summers at a cottage fitted up for them at pretty Chiefswood, near Abbotsford, gave the young couple the constant enjoyment of friendship, society, and even worldly distinction, added to the blessing of a perfect home. At Chiefswood Lockhart's two eldest children, John Hugh and Charlotte, were born; Walter, later, at Brighton.

Between 1818, when he joined the *Blackwood* staff, and 1825 Lockhart's pen was indefatigably at work. As early as 1819 *Peter's Letters to his Kinsfolk* appeared. Like Goldsmith's *Citizen of the World*, these profess to give the impressions of a stranger in a new country. Dr. Peter Morris, a Welsh physician, passes some time in Scotland, especially in Edinburgh, and describes the men and manners very freely to his relations at home. His descriptions of the chief notabilities of the day have a certain historical, almost antiquarian interest, though now the least interesting part of the work. What we enjoy most is the reflection of a young and ardent mind dealing out opinions and estimates far beyond its years, the correctness of which time has singularly verified. The amount of reading too which crops out in every page is amazing; a perpetual play of allusions, quotations, and happy nicknames—for which Lockhart to his last days was famous—is given with a raciness of tone of which the reader might tire, but for the simple, vigorous English in which it is clad. A chapter on dandies is a *chef d'œuvre* in its way. That a work describing the appearance and idiosyncrasies of many living individuals should give offence was a matter of course. His description of the northern universities was not likely to please; while for the unsparing ridicule and ruthless quizzing heaped on the General Assembly—"men," he is supposed to have said, "of like passions with ourselves, but worse manners"—it would be strange indeed if the author had escaped with impunity.

Valerius, a Roman Story, followed next (1821). As *Valerius* was intended to illustrate the manners and customs of Rome in the time of Trajan, so *Reginald Dalton*, published in 1823, aimed at exhibiting the life of an undergraduate at Oxford as he had known it. Lockhart's strength did not lie in novel writing, and, to those who read *Reginald Dalton* now, the digressions of the author are far more interesting than the adventures of the hero. But a plot of simpler construction and intenser passion showed Lockhart's strength to greater advantage. *Adam Blair* (1822) is a tale of temptation, fall, and repentance, each fearful in its way, told with tremendous power, and as far removed from all that is morbid and false in sentiment as the author was himself. It gave great offence to the Scottish Church, for the erring man is a minister, and the scene is laid in a Scottish manse.

In 1826, on the death of Mr. Gifford, the editorship of the *Quarterly Review* was offered to Lockhart, and accepted. He was singularly free in position, however far from idle. He was next heir to Milton Lockhart, the property of his unmarried half-brother, who eventually survived him; the legal profession to which he had been destined was virtually abandoned; and time had shown him that the party strife which prevailed in Edinburgh was demoralizing to both sides. This last conviction did the most to reconcile him to the separation from all Scottish surroundings. His friends gave him a farewell dinner, when, laboring with strong feelings, and with his habitual dislike or incapacity to express them, he said, on returning thanks, "You all know that I am no speaker; had I been, there would have been no occasion for this parting."

The conduct of a great periodical like the *Quarterly Review* is the touchstone of a man's capacity, knowledge, and temper. Looking back to an editorship which lasted twenty-eight years, it must be admitted that Lockhart maintained a high position in all these respects. He contributed largely to the *Review* himself, his biographical articles being especially admirable. He also found time, being a very glutton in work, for many a paper in *Blackwood;* he wrote what remains the most charming of the biographies of Burns; and he undertook the superintendence of the series called *Murray's Family Library*, which he opened in 1829 with a *Life of Napoleon*. But his chief work was the *Life of Walter Scott*, a task at once of love and duty. Lockhart knew the great and good man as no one else did, and felt that, whatever the mistakes in judgment, no life from first to last could better afford complete revelation. There have not been wanting those in Scotland who have taxed him with ungenerous exposure of his subject, but to most healthy minds the impression conveyed by the biography was, and is, one of the most opposite kind—namely, that Lockhart has almost deified Scott. The labor incurred was in so far one of love, inasmuch as the writer reaped no part of its considerable proceeds, but resigned them absolutely for the benefit of Scott's creditors.

Lockhart's life in London was a long succession of constant work, of dignified social success, and of heavy bereavements. His eldest boy, the suffering "Hugh Littlejohn" of the *Tales of a Grandfather*, died in 1831. Sir Walter died in 1832; Anne Scott, the second daughter, who had come to live with the Lockharts in London, in 1833; Mrs. Lockhart in 1837. The love for his children was for long the one bright element in his life. But the death in 1852, and, sadder still, the previous life, of his surviving son Walter, a fine youth, who had entered the army under unfortunate auspices, broke down all that remained of health and spirit in the father.

Failing health compelled Lockhart to resign the editorship of the *Quarterly Review* in 1853. He spent the next winter in Rome, but returned to England with no restoration of vital power. He was conveyed to Abbotsford, where, under the tender care of his daughter Mrs. Hope Scott, and cheered by the prattle of his grand-daughter, now the possessor of Abbotsford, he lingered till his death, November 25, 1854. He was buried in Dryburgh Abbey, at the feet of Walter Scott. (E. E.)

LOCKPORT, capital of Niagara county, New York, about 21 miles east of Niagara Falls, at the point where the New York Central Railroad crosses the Erie canal. It takes its name from the locks (ten in number) by which the canal is lowered 66 feet from the level of Lake Erie to that of the Genesee river; and its prosperity as a manufacturing centre is due to the water-power. The surrounding country is a rich agricultural district, and in the vicinity are extensive limestone and sandstone quarries. Flour-mills are prominent among the industrial establishments; there are also numerous saw-mills, cotton and woollen factories, foundries, etc. Lockport was made a city in 1865. The population in 1870 was 12,426; in 1900, 16,581. The buildings in the business part of the city are generally heated by steam on the Holly distributing system, which originated in Lockport, as did the celebrated Holly water-works system.

LOCLE, Le, a large town-like village of Switzerland, in the canton of Neuchatel, 10 miles W. N. W. from Neuchatel. Along with La Chaux de Fonds, 5 miles north-east, it is the seat of the most extensive watch-making industry in the world; and it also carries on the domestic manufacture of lace. The valley in which Le Locle is situated used to be subject to inundation, but in 1802–6 a tunnel was constructed by which the surplus waters of the Bied discharge into the Doubs. About a mile to the west of the town the stream plunges into a deep chasm, and on the almost vertical face of the rock are what are usually called the subterranean mills of Cul des Roches, situated one above the other, to turn the water-power to account. The population of the commune was 12,626 in 1900.

LOCRI, a people of Greece who are found in two different districts, on the Ægean coast opposite Eubœa and on the Corinthian Gulf between Phocis and Ætolia. The former are divided into the northern Locri Epicnemidii, so called from Mount Cnemis, and the southern Locri Opuntii, whose chief town was Opus; but the name Opuntii is applied to the whole district by Thucydides, Herodotus, etc. Homer knows no distinction of tribes among the Locri. They were considered by Aristotle to be a Lelegian tribe; but they became Hellenized at an early time, and rank in Homer along with the other Greek tribes before Troy. Their national hero is Ajax Oileus, who often appears on coins. The Locri Ozolæ on the Corinthian Gulf were a rude and barbarous race who make no appearance in Greek history till the Peloponnesian War. It is said that they separated from the eastern Locri four generations before the Trojan war, but Homer does not mention them. The most probable view is that the Locri were once a single race spread from sea to sea, that subsequent immigrations forced them into two separate districts, and that the eastern Locri advanced with the growth of civilization, while the remote Ozolæ remained ignorant and barbarous.

A colony of Locrians, probably Opuntians, though Strabo expressly calls them Ozolæ, settled at the south-west extremity of Italy about the end of the 8th century B. C. They are often called Locri Epizephyrii from the promontory Zephyrion 15 miles south of the city. The earliest and most famous event recorded in the history of the Italian Locri is the legislation of Zaleucus about the middle of the 8th century B. C. The Locri boasted that Zaleucus was the first of the Greeks to promulgate a written code of laws. A body of laws under his name existed in the city throughout the historical period, but the name of Zaleucus is almost as much surrounded with legend as that of Lycurgus. The Locrians are said to have defeated the people of Crotona in a great battle at the Sagras, perhaps some time in the 6th century B. C., and in this flourishing period they founded colonies along the south coast of the peninsula. Their nearest neighbor was Rhegium, and the continual wars that raged between the two cities often drew other states into their quarrels. They sent ships to aid Sparta in the Lacedæmonian war. They were allied with the elder Dionysius of Syracuse, who gave them great accessions of territory (389–88 B. C.); the younger Dionysius ruled them as tyrant (356 B. C.). They admitted a Roman garrison before the expedition of Pyrrhus, but sided against the Romans with him and with Hannibal (216 B. C.). The town was finally captured by Scipio (205 B. C.). From this time we hear little of Locri. It seems still to have existed in the 6th century A. D., but in the Middle Ages it had disappeared entirely. The site and remains have been described by the Duc de Luynes (*Ann. Inst. Arch.*, ii.). It possessed a famous temple of Proserpine. The town is celebrated by Pindar, *Ol.* x. and xi.

LOCUS, in Greek *τόπος*, a geometrical term, the invention of the notion of which is attributed to Plato. It occurs in such statements as these:—The locus of the points which are at the same distance from a fixed point, or of a point which moves so as to be always at the same distance from a fixed point, is a circle; conversely a circle is the locus of the points at the same distance from a fixed point, or of a point moving so as to be always at the same distance from a fixed point; and so in general a curve of any given kind is the locus of the points which satisfy, or of a point moving so as always to satisfy, a given condition. The theory of loci is thus identical with that of curves; and it is in fact in this very point of view that a curve is considered in the article Curve; see that article, and also Geometry (Analytical). It is only necessary to add that the notion of a locus is useful as regards determinate problems or theorems: thus, to find the centre of the circle circumscribed about a given triangle ABC, we see that the circumscribed circle must pass through the two vertices A, B, and the locus of the centres of the circles which pass through these two points is the straight line at right angles to the side AB at its mid-point; similarly the circumscribed circle must pass through A, C, and the locus of the centres of the circles through these two points is the line at right angles to the side AC at its mid-point; thus we get the ordinary construction, and also the theorem that the lines at right angles to the sides, and their mid-points respectively, meet in a point. The notion of a locus applies, of course, not only to plane but also to solid geometry. Here the locus of the points satisfying a single (or onefold) condition is a surface; the locus of the points satisfying two conditions (or a twofold condition) is a curve in space, which is in general a twisted curve or curve of double curvature.

LOCUST. In its general acceptation this term is strictly applicable only to certain insects of the order *Orthoptera*, family *Acrydiidæ* (see Insects); and it is advisable to reiterate that according to modern classification the family *Locustidæ* is now viewed in a sense that does not admit of what are popularly termed "locusts" being included therein. We universally associate with the term the idea of a very destructive insect; therefore many orthopterous species that cannot be considered true locusts have had the term applied to them: in North America it has even embraced certain *Hemiptera-Homoptera*, belonging to the *Cicadidæ*, and in some parts of England cockchafers are so designated. In a more narrow definition of the term we are wont to associate with the destructive propensities the attribute of migration, and it therefore becomes necessary that a true locust should be a migratory species of the family

Acrydiidæ. Moreover, the term has yet a slightly different signification as viewed from the Old or New World. In Europe by a locust is meant an insect of large size, the smaller allied species being ordinarily known as "grasshoppers," hence the notorious "Rocky Mountain locust" of North America is to Eastern ideas rather a grasshopper than a locust.

In Europe, and a greater part of the Old World, the best known migratory locust is that which is scientifically termed *Pachytylus migratorius*, to which is attached an allied (but apparently distinct) species known as *P. cinerascens*. Another locust found in Europe and neighboring districts is *Caloptenus italicus*, and still another, *Acrydium peregrinum*, has once or twice occurred in Europe (even in England in 1869), though it can only be considered a straggler, its home (even in a migratory sense) being more properly Africa and Asia. These practically include all the locusts of the Old World, though a migratory species of South Africa known as *Pachytylus pardalinus* (presumed to be distinct from *P. migratorius*) should be mentioned. The Rocky Mountain locust of North America is *Caloptenus spretus*, and in that continent there occurs an *Acrydium* (*A. americanum*) so closely allied to *A. peregrinum* as to be scarcely distinct therefrom, though there it does not manifest migratory tendencies. In the West Indies and Central America the absolutely true *A. peregrinum* is also reported to occur.

As to general biology, a few words will suffice. The females excavate holes in the earth in which the eggs are deposited, regularly arranged in a long cylindrical mass enveloped in a glutinous secretion. The young larvæ hatch, and immediately commence their destructive career. As these insects are "hemimetabolic" (see INSECTS), there is no quiescent stage; they go on increasing rapidly in size, and as they approach the perfect state the rudiments of the wings begin to appear. Naturally in this stage they are incapable of flight, but their locomotive powers are nevertheless otherwise extensive, and their capacity for mischief very considerable, for their voracity is great. Once winged and perfect, these powers become infinitely more disastrous, redoubled by the development of the migratory instinct. The laws regulating this instinct are not yet perfectly understood. Food and temperature have a great deal to do with it, and there is a tendency for the flights to take a particular direction, varied by the physical circumstances of the breeding districts. So likewise it is certain that each species has its area of constant location in which it always exists, and its area of extraordinary migration to the extremes of which it only occasionally extends. Perhaps the most feasible of the suggestions as to the causes of the migratory impulse is that locusts naturally breed in dry sandy districts in which food is scarce, and are thus impelled to wander in order to procure the necessaries of life; but against this it has been argued that swarms bred in a highly productive district in which they have temporarily settled will seek the barren home of their ancestors. Another ingenious suggestion is that migration is intimately connected with a dry condition of the atmosphere, urging them to move on until compelled to stop for food or procreative purposes. The distance particular swarms may travel depends upon a variety of circumstances, such as the strength of impulse, the quantity of food, and many other causes. Certain it is that 1000 miles may, in particular cases, be taken as a moderate estimate; probably it is often very much less, certainly sometimes very much more. As a rule the progress is only gradual, and this adds vastly to the devastating effects, which may be likened to those caused by a foreign army levying black-mail upon the inhabitants of an invaded country through which it is marching. When an extensive swarm temporarily settles in a district, all vegetation rapidly disappears, and then hunger urges them on another stage. Such is their voracity that it has been tolerably well ascertained that the large Old World species, although undoubtedly phytophagous, are often compelled by hunger to attack at least dry animal substances, and even cannibalism has been asserted as an outcome of the failure of all other kinds of food. The length of a single flight must depend upon circumstances. From certain individual peculiarities in the examples of *Acrydium peregrinum* that were taken in England in 1869, it has been asserted that they must of necessity have come direct by sea from the west coast of Africa; and what is probably the same species has been seen in the Atlantic at least 1200 miles from land, in swarms completely covering the ship, and obscuring the air; thus, although it is no doubt usual for the swarms to rest during the night, it undoubtedly happens in certain cases that flight must be sustained for several days and nights together. The height at which swarms fly, when their horizontal course is not liable to be altered by mountains, has been very variously estimated at from 40 to 200 feet, or even in a particular case to 500 feet. A "dropping from the clouds" is a common expression used by observers when describing the apparition of a swarm. The extent of swarms, and the number of individuals in a swarm, are matters that must of neeessity be purely speculative. That the sun may sometimes be utterly obscured, and the noise made by the rustling of the wings be deafening, is confirmed by a multitude of observers. We prefer to decline the attempt to grapple with so vast a subject,—not unnaturally so when one observer says of a particular swarm that, when driven out to sea and drowned, the dead bodies washed up formed a bank 50 miles long and 3 or 4 feet high.

No special periodicity appears to have governed these flights (which, it is necessary to state, happily do not occur to an alarming extent every year), still an American writer (Mr. Thomas) makes the interesting remark that the interim between the years of superlatively extraordinary appearance is both in Europe and America "very nearly a multiple of 11."

In Europe the best known and ordinarily most destructive species is *Pachytylus migratorius* (fig. 1), and it is to it that the numerous records of devastations in Europe mainly refer, but it is probably not less destructive in many parts of Africa and Asia. Eastern Europe, and especially the plains of southern Russia, appear to be more especially liable to its attacks. That the arid steppes of Central Asia are the home of this insect appears probable; still much on this point is enveloped in uncertainty. In any case the area of permanent distribution, according to Köppen (who published an elaborate memoir on the subject in 1871), is enormous, and that of occasional distribution is still greater. The former area extends from the parallel of 40° N. in Portugal, rising to 48° in France and Switzerland, and passing into Russia at 55°, thence continuing across the middle of Siberia, north of China to Japan; thence south to the Fiji Islands, to New Zealand, and North Australia; thence again to Mauritius and over all Africa to Madeira. But Köppen remarks that the southern distribution is uncertain and obscure. Taking exceptional distribution, it is well known that it occasionally appears in the British Isles, and has in them apparently been noticed as far north as Edinburgh; so also does it occasionally appear in Scandinavia, and it has probably been seen up to 63° N. in Finland. Looking at this vast area, it is easy to conceive that an element of uncertainty must always exist with regard to the exact determination of the species, and in Europe especially is this the case, because (as before stated) there exist an apparently distinct species, known as *P. cinerascens*, which Köppen does not take into account. This latter species is certainly the most common of the "locusts" occasionally found in the British Isles, and De Selys-Longchamps is of opinion that it breeds regularly in Belgium, whereas the true *P. migratorius* is only accidental in that country. In the case of this, as of all other locusts, it is impossible within the limits of this article to chronicle even the years of greatest abundance. That they are probably as destructive now as formerly appears within the bounds of belief. At any rate we read that a year or two ago a detachment of Russian soldiers in Turcomania was so beset that a stampede at last took place, and eventually the men were held prisoners by the insects forty-eight hours until the villagers killed them and carried them away for manure, locomotion being as difficult as if the men had been on ice.

Acrydium peregrinum (fig. 2) can scarcely be considered

even an accidental visitor to Europe; yet it has been seen in the south of Spain, and, most extraordinarily, in many

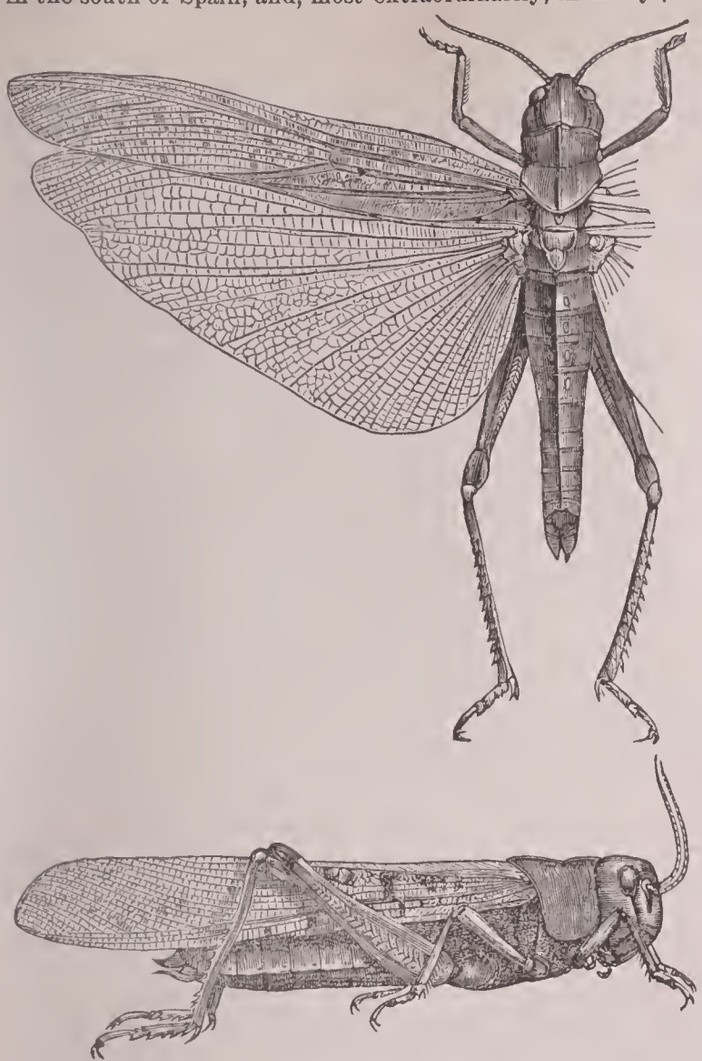

FIG. 1.—*Pachytylus migratorius.*—This and the other figures are all natural size.

examples spread over a large part of England in the year 1869. It is a larger insect than *P. migratorius.* No serious attempt to define the range of this species has yet been made, but there is every reason to believe that it is the most destructive locust throughout Africa and India and other parts of tropical Asia, and its ravages are not one whit less important than are those of *P. migratorius.* Presumably it is the species that, on more than one occasion, has been noticed in a vast swarm in the Atlantic, very far from land, and presumably also it occurs in the West Indies and some parts of Central America. But it has been already remarked that *A. americanum* of North America, although so closely allied as to be scarcely distinguishable, is said not to be migratory, and is therefore scarcely a true "locust." In the Argentine Republic a (possibly) distinct species (*A. paranense*) is the migratory locust.

Caloptenus italicus (fig. 3) is a smaller insect, with a less extended area of migration; and, though from this cause its ravages are not so notable, still the destruction occasioned in the districts to which it is limited is often scarce less than that of its more terrible allies. It is essentially a species of the Mediterranean district, and especially of the European side of that sea, yet it is also found in North Africa, and appears to extend far into southern Russia.

Caloptenus spretus (fig. 4) is the "Rocky Mountain locust" or "hateful grasshopper" of the North American continent. Though a comparatively small insect, not so large as some of the grasshoppers of English fields, its destructiveness has procured for it within the last twenty years a notoriety scarcely excelled by that of any other. It is only recently that the persistent migration of American settlers westward extended into the home of this creature. Travellers and prospectors in these regions had previously spoken of enormous swarms of a destructive grasshopper as existing there, and no doubt these occasionally extended into regions already civilized, but the species was not recognized as distinct from some of its non-migratory congeners to which it is so closely allied as to require a practised entomological eye to separate it therefrom. As time drew on, the various "State entomologists" made it their special duty to report on the insect, and at length, in 1877, the matter had become so serious that Congress appointed a United States Entomological Commission to investigate the subject, and to report upon the best (if any) means of counteracting the evil effects of the pest. The result, so far as published, consists of two enormous volumes, teeming with information, and taking up the whole subject of locusts both in America and the Old World. *C. spretus* has its home or permanent area in the arid plains of the central region east of the Rocky Mountains, extending slightly into the southern portion of British North America; outside this is a wide fringe to which the term sub-permanent is applied, and this is again bounded by the limits of only occasional distribution, the whole occupying a large portion of the North American continent; but it is not known to have crossed the Rocky Mountains westward, or to have extended into the eastern States.

As to remedial or preventive measures tending to check the ravages of locusts, little unfortunately can be said, but anything that will apply to one species may be used practically with all. One point is certain; direct remedies must always be of small avail. Something can be done (as is now done in Cyprus) by offering a price for all the egg-tubes collected, which is certainly the most direct manner of attacking them. Some little can be done by destroying the young larvæ while yet in an unwinged condition, and by digging trenches in the line of march into which they can fall and be drowned or otherwise put an end to. Infinitesimally little can be done with the winged hordes having the migratory instinct upon them; starvation, the outcome of their own work, probably here does much. It has been shown that with all migratory locusts the breeding places, or true homes, are comparatively barren districts (mostly elevated plateaus); hence the progress of civilization and colonization, with its concomitant necessity for converting those heretofore barren plains into areas of fertility, may (and probably will) gradually lessen the evil.

Locusts, like all other animals, have their natural enemies. Many birds greedily devour them, and it has many times been remarked that migratory swarms of the insects were closely followed by myriads of birds. Predatory insects of other orders also attack them, especially when they are in the unwinged condition. Moreover, like

FIG. 2.—*Acrydium peregrinum.*

all other insects, they have still more deadly insect foes as parasites. Some attack the fully developed winged insect.

But the greater part adopt the more insidious method of attacking the eggs. To such belong certain beetles, chiefly of the family *Cantharidæ*, and especially certain two-winged flies of the family *Bombyliidæ*. These latter, both in the Old and New World, must prevent vast quantities of eggs

Fig. 3.—*Caloptenus italicus.*

from producing larvæ. Popular ignorance on this subject is yet great, and within a few months before this article was written it was exemplified in a remarkable manner by a suggestion from the Government officials of Cyprus that a certain parasite known to be destructive to the eggs in

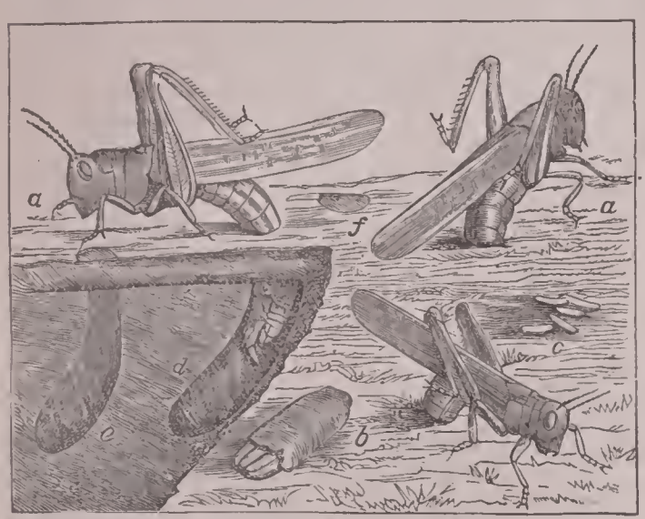

Fig. 4.—Rocky Mountain Locust (*Caloptenus spretus*). *a*, *a*, *a*, female in different positions, ovipositing; *b*, egg-pod extracted from ground, with the end broken open; *c*, a few eggs lying loose on the ground; *d*, *e* show the earth partially removed, to illustrate an egg-mass already in place, and one being placed; *f* shows where such a mass has been covered up. (After Riley.)

Asia Minor might be introduced into the island, a suggestion immediately followed by the discovery that what is probably the same parasite already existed there.

A flight of locusts would appear not to be always an unmixed evil, even to man. The larger Old World species form articles of food with certain semi-civilized and savage races, by whom they are considered as delicacies, or as part of ordinary diet, according to the race and the method of preparation.

Literature.—Kirby and Spence, *Introduction to Entomology*, 7th ed. London, 1856; Köppen, "Die geographische Verbreitung der Wanderheuschrecke," in *Geograph. Mittheilungen*, vol. xvii., 1871; Gerstäcker, *Die Wanderheuschrecke*, Berlin, 1876; *Reports of the United States Entomological Commission on the Rocky Mountain Locust*, by Riley, Packard, Thomas, and others, 2 vols., Washington, 1878–80. (R. M'L.)

LOCUST-TREE, *Ceratonia Siliqua*, L., the carob-tree, of the tribe *Cassieæ* of the order *Leguminosæ*, is the sole species, widely diffused spontaneously and by cultivation from Spain to the eastern Mediterranean regions, and from Egypt to Bornou in Central Africa (Hogg, Hooker's *Journ. of Bot.*, i. 113), and imported to Hindustan (Graham, p. 254). It differs from all leguminous plants by the dilated disk to the calyx. It has no petals, and flowers are polygamous or dioecious. The legume is compressed, often curved, indehiscent, and coriaceous, but with sweet pulpy divisions between the seeds, which, as in other genera of the *Cassieæ*, are albuminous. The pods are eaten by men and animals, and in Sicily a spirit and a syrup are made from them. These husks being often used for swine are called swine's bread, and are probably referred to in the parable of the Prodigal Son. It is also called St. John's bread, from a misunderstanding of Matt. iii. 4. The carob-tree was regarded by Sprengel as the tree with which Moses sweetened the bitter waters of Marah (Exod. xv. 25), as the *kharrúb*, according to Avicenna (p. 205), has the property of sweetening salt and bitter waters. Gerard (*Herball*, p. 1241) cultivated it in 1597, it having been introduced in 1570 (Loudon's *Arb.*, ii. 660). For various names, extent of distribution, historical references, etc., see Pickering's *Chron. Hist. of Pl.*, p. 141.

LODÈVE, capital of an arrondissement of the department of Hérault, France, lies at an elevation of 674 feet, under a range of hills rising to 2790 feet, in a small valley where the Soulondré joins the Lergue, a tributary of the Hérault, 34 miles east-north-east from Montpellier. A bridge over the Lergue connects the town with the faubourg of Carmes on the left bank of the river, and two bridges over the Soulondré lead to the extensive ruins of the Château de Montbrun. There is railway communication with Agde by a line following the Hérault valley. The old cathedral of St. Fulcran, founded by him in 950, was rebuilt in the 14th century and restored in the 16th; the cloister, dating from the 15th century, is ornate in style. In the picturesque environs of the town stands the well-preserved monastery of St. Michel de Grammont, dating from the 12th century; it is now used as farm buildings. In the neighborhood are three fine dolmens. Lodève is one of the most important industrial centres of the south of France, upwards of 7000 workmen being employed in the manufacture of woollens for army clothing; the aggregate horse-power of the factories is 1500. Wool is imported in large quantities from the neighboring provinces, and from Morocco; the exports are cloth to Italy and the Levant, wine, brandy, chemicals, and wood. The population in 1901 was 6,724.

Luteva existed prior to the invasion of the Romans, who for some time called it *Forum Neronis*. The inhabitants were converted to Christianity by St. Flour, first bishop of the city, about 323. After passing successively into the hands of the Visigoths, the Franks, the Ostrogoths, the Arabs, and the Carlovingians, it became in the 9th century a separate countship, and afterwards the domain of the bishops of Lodève. During the religious wars it suffered much, especially in 1573, when it was sacked. It ceased to be an episcopal see in 1789.

LODGE, Thomas (*c.* 1556–1625), dramatist, novelist, pamphleteer, poet,—but *not* player,—was born about the year 1556 at West Ham, and was possibly the son of a namesake, shortly afterwards lord mayor of London. He was educated at Trinity College, Oxford, and then entered as a student at Lincoln's Inn, where, as in the other Inns of Court, a love of letters and a crop of debts and difficulties alike grew as matters of course. Thus already as a young man he preferred the looser ways of life and the lighter aspects of literature. When the penitent Stephen Gosson had (in 1579) published his *Schoole of Abuse*, Lodge took up the glove in his *Defence of Poetry, Music, and Stage-plays* (1579 or 1580), which shows some of the moderation as well as of the learning befitting a scholar and a gentleman. The publication was, however, prohibited, besides being answered by Gosson in his *Playes Confuted in Five Actions*, as by a man sure of his ground if not of his cause. Having fleshed his pen, Lodge displayed a strong inclination for continuing its use. In 1584 he published his *Alarum Against Usurers*, a pamphlet to which he no doubt gave the benefit of his personal experience, and in which he mentions the fate of his previous literary venture. Soon after this his years of wandering seem

to have begun. It is clear that their primary cause lay in the straits to which he had been reduced, or had reduced himself; that he ever took so bold a leap into disreputableness as to become an actor is improbable in itself, and the assertion which has been made to that effect has been shown to rest on something less satisfactory than conjecture. Lodge joined Captain Clarke in his raid upon Terceira and the Canaries, and seems, in 1591, to have made another similar voyage with Cavendish. During the former expedition, he, to beguile the tedium of his voyage, composed his prose tale of *Rosalynde, Euphues' Golden Legacie*, which, published in 1590, afterwards suggested the story of *As You Like It*. The novel, which in its turn owes some, though no very considerable, debt to the *Tale of Gamelyn*, is a pleasing example of the Euphuistic manner, but proves how slight an advance an individual author of secondary rank is able to effect in a branch of composition of which the genius of his age has not taken hold. In the year before (1589) Lodge had already given to the world a volume of poems, including the delectable *Scillaes Metamorphosis*. One would gladly resign this and much else of Lodge's sugared verse, together with some of his perfumed prose, for the lost *Sailor's Kalender*, in which he must after some fashion have told of his sea adventures. During the last decade of the century he produced a *farrago* of literary products—a Juvenal, if not a very "Young Juvenal," at least in the readiness of his wit and in the robustness of his moral indignation. In conjunction with Greene he produced, in a popular vein, the odd but far from feeble play of *A Looking Glasse for London and England*. Probably about the same time he wrote his *Tragedy of the Wounds of Civil War lively set forth in the True Tragedies of Marius and Sylla* (published 1594), a good second-rate piece in the fashion of its age, and deficient neither in rhetorical nor in comic vigor. His *Life and Death of William Longbeard* (1593), and his *History of Robin the Divell*, are among his contemporary non-dramatic works; to which should be added *Phillis* (1593), a collection of lyrical pieces, and a *Fig for Momus* (on the strength of which he has been rather loosely termed the earliest English satirist). In his later years,—possibly about 1596, when he published his *Wits Miserie*, which is dated from Low Leyton, and the prose *Prosopopeia* (if, as seems probable, it was his), in which he repents him of his "lewd lines" of other days,—he was engaged in the practice of medicine, for which he is said to have qualified himself by a degree at Avignon. His works henceforth have a sober cast, comprising a translation of Josephus (1602) and another of Seneca (1614), besides a *Treatise of the Plague* (1603), and a popular manual, still in manuscript, on *Domestic Medicine*. He was abroad on urgent private affairs of one kind or another in 1616, from which time to his death from the plague, in 1625, nothing further concerning him remains to be noted. His life is one of those which attract the curiosity of the literary student, who knows that it is precisely in the mental and moral phases and experiences of able and active men devoid of original genius, such as he, that much of the history of an age of literature is to be read.

Lodge's works have not yet been completely reprinted, though the satisfaction of this want may no longer be far distant. His *Rosalynde* is accessible in Hazlitt's *Shakespeare's Library* (vol. ii.) and elsewhere. Its relation to Shakespeare's comedy is exhaustively discussed in an essay by Delius in the *Jahrbuch* of the German Shakespeare Society (1871). Other works of his are scattered through the publications of the old Shakespeare, the Hunterian, and possibly other Societies; lists of them will be found in the edition of *Glaucus and Silla*, etc., printed at the Chiswick Press in 1839, in Hazlitt, and elsewhere. The question, *Was Thomas Lodge an Actor?* has been set at rest by Dr C M. Ingleby in his pamphlet bearing that title (1868), of which the main conclusion is embodied in this notice.

(A. W. W.)

LODI, a city of Italy, in the province of Milan, lies on the right bank of the Adda, in 45° 18′ N. lat. and 9° 30′ E. long. The site of the city is an eminence rising very gradually from the Lombard plain, and the surrounding country is one of the richest dairy districts in Italy. A rather plain and ungainly cathedral (1158) with a huge lateral tower, the church dell' Incoronata erected by Bramante in 1476, the Palazzo Modegnani with a fine gateway in the style of Bramante, the episcopal palace dating from 1202, and the great hospital with its cloistered quadrangle, are the most noteworthy buildings. Besides an extensive trade in cheese (Lodi making more Parmesan than Parma itself) and other dairy produce, there are manufactures of linen, silk, majolica, and chemicals. The population of the city in 1901 was 20,730.

The ancient Laus Pompeia lay about 5 miles west of the present city, and the site is still occupied by a considerable village, Lodi Vecchio. In the 11th century, according to Landulphus Junior, Lodi was second to Milan among the cities of northern Italy. A dispute with the archbishop of Milan about the investiture of the bishop of Lodi (1024) proved the beginning of a bitter and protracted feud between the two cities. In 1111 the Milanese laid the whole place in ruins and forbade their rivals to restore what they had destroyed, and in 1153, when in spite of this prohibition a fairly flourishing settlement had again been formed, they repeated their work in a more thorough manner. A number of the Lodigians had settled on Colle Eghezzone and their village, the Borgo d'Isella, soon grew up under the patronage of Frederick Barbarossa into a new city of Lodi. At first subservient to the emperor, Lodi was before long compelled to enter the Lombard League, and in 1198 it formed alliance offensive and defensive with Milan. The strife between the Sommariva or aristocratic party and the Overgnaghi or democratic party was so severe that the city broke into two distinct communes. The Overgnaghi, expelled in 1226, were restored by Frederick II. who took the city after three months' siege. During the rest of the Guelf and Ghibelline struggle, and down to the beginning of the 16th century, the annals of Lodi are crowded with stirring events, connected for the most part with the general troubles of the country. In the main it was dependent on Milan. The duke of Brunswick captured it in 1625 in the interests of Spain; and it was occupied by the French (1701), by the Austrians (1706), by the king of Sardinia (1733), by the Austrians (1736), by the Spaniards (1745), and again by the Austrians (1746). On 10th May, 1796, was fought the battle of Lodi between the Austrians and Napoleon, which made the latter master of Lombardy.

LODZ (*Lodzi*), a town of Russian Poland, in the province of Piotrokow, lies 40 miles by rail to the north of the chief town of the province, on a branch railway of the line between Warsaw and Vienna. Only a small hamlet with 800 inhabitants in 1821, when its woollen manufactures were first introduced by Germans, it is now the second town of Poland, both by population and by the importance of its cotton-mills, the annual production of which amounts to a value of about £150,000, that is, five-sixths of the whole production of cottons in Poland. This, as well as the other less important industries of the place (woollen cloth manufacture, dyeing, and so on), is chiefly in the hands of Germans, and thus the German language predominates in the town. Although its population in 1900 amounted to 351,570, Lodz still maintains its village character, consisting of one broad street 7 miles long, on which are situated alike the factories, the houses of the merchants, and the dwellings of the working men.

LOFOTEN AND VESTERAALEN, a "fogderi" or bailiwick in the "amt" of Nordland, Norway, consists of a large and picturesque group of islands lying north-east and south-west off the north-west coast of Norway, between 67° 30′ and 69° 20′ N. lat., and between 12° and 16° 35′ E. long. The extreme length of the group from Andenæs, at the north of Andö, to Röst, is about 130 English miles; the aggregate area amounts to about 1560 square miles, supporting a permanent population of about 30,000. It is separated from the mainland by the Vestfjord, Tjældsund, and Vaagstjord, and is itself divided into two sections by the Raftsund between Hindö and Öst-Vaagö: to the west and south of the Raftsund lie the Lofoten Islands proper, of which the most important are Öst-Vaagö, Gimsö, Vest-Vaagö,

Flakstadö, Moskenæsö, Mosken, Värö, and Röst; east and north of the Raftsund are the islands of Vesteraalen, the chief being Hindö, Ulvö, Langö, Skogsoö, and Andö. The islands, which are all of granite or metamorphic gneiss, are precipitous and lofty; the highest peaks are in the Lofoten group, Vaagekallan on Öst-Vaagö rising directly from the sea to a height of 3090 feet. The channels which separate them are narrow and tortuous, and generally of great depth; they are remarkable for the strength of their tidal currents, particularly the Raftsund mentioned above, and the once famous Malström or Moskenström between Moskenæs and Mosken. Though situated wholly within the Arctic Circle, the Lofoten and Vesteraalen group enjoys a climate that cannot be called rigorous when compared with that of the rest of Norway. The isothermal line which marks a mean January temperature of 32° F. runs south from the Lofotens, passing a little to the east of Bergen onwards to Gothenburg and Copenhagen. The prevailing winds are those from the south and west; the mean temperature for the year is 38°·5 F., and the annual rainfall is 43·34 inches. In summer the hills have only patches of snow, the snow limit being about 3000 feet. The natural pasture produced in favorable localities permits the rearing of cattle to some extent; but the growth of cereals (chiefly barley, which here matures in ninety days) is insignificant. A few potatoes are planted. The islands yield no wood. The great and characteristic industry of the district, and an important source of the national wealth, is the cod fishery which is carried on along the east coast of the Lofotens in the Vestfjord from January to April. It employs about 18,000 men from all parts of Norway; the annual take of cod amounts to an average of twenty millions, worth on the spot about £250,000. The fish, which is dried during early summer, is exported principally to Spain (where it is known as bacalao), but also to Holland, Sweden, and Belgium. Other industries arising out of the fishery are the manufacture of cod-liver oil and of artificial manure. The summer cod fisheries and the lobster fishery are also valuable. The herring is frequently taken in large quantities off the west coasts of Vesteraalen, but is a somewhat capricious visitant. The bailiwick contains no towns properly so called, but Kabelvaag on Öst-Vaagö and Svolvær on a few rocky islets off that island are considerable centres of trade and (in the fishing season) of population; Lödingen also, at the head of the Vestfjord on Hindö, is much frequented as a port of call. Regular means of communication are afforded by the steamers which trade between Hamburg or Christiania and Hammerfest, and also by local vessels; less accessible spots can be visited by means of boats, in the management of which the natives are adepts. There are some roads on Hindö, Langö, and Andö. The largest island in the group, and indeed in Norway, is Hindö, with an area of 864 square miles. The south-eastern portion of it belongs to the amt of Tromsö. In the island of Andö there is a bed of coal at the mouth of Ramsaa which is likely to prove ultimately of some practical value.

LOG. The ordinary log for ascertaining the speed of a ship consists of four parts, viz., the log-glass, log-line, log-reel, and log-ship. The word log may have been derived from the fact that a piece of wood was thrown overboard, to lie as a log in a fixed position, motionless; now the same name is applied to many contrivances and ingenious inventions for indicating directly, or for registering, the ship's progress through the water.

Though such information now appears to be so essential, nay, imperatively necessary to the safe conduct of a ship, it is a fact that no such simple means as the log and line was devised before the 17th century, or the subject even thought of theoretically before 1570. At least nothing can be found in ancient writings, or even in the works professedly treating upon navigation, till after 1620, while, on the contrary, various passages occur from which we may fairly infer that there was nothing better at the command of the mariner than a rough unassisted estimate. The work of Martin Cortes (Seville, 1556), after giving much valuable information for that day, including a description and use of the cross-staff, astrolabe, etc., a table of the sun's declination, with much else, makes no other reference to the ship's motion through the water than this,—the pilot must estimate the distance, making allowance for the effects of winds and currents, every day, and as the estimation "is imperfect, especially in a long voyage and long time, it is convenient that he should rectify his position by the corresponding position of the heavens." Mr. J. Tapp, who published a translation and improved edition of Martin Cortes fifty-three years after (1609), made no alteration in that part of the work.

In 1578 William Bourne published *Inventions and Devices*. There are one hundred and thirteen subjects treated of, many of them highly interesting, as they contain the crude germ of useful inventions. The twenty-first device is a close approach to Massey's self-registering log, which was found so useful two hundred and sixty years later. The credit of the device is ascribed to Humfray Cole; the probable date is 1570. The proposal was to have a "little small close boat" with a wheel, or wheels, and an axletree, to turn clock-work in the little boat, with dials and pointers to indicate respectively fathoms, leagues, scores of leagues, and hundreds of leagues. If a small screw rotator had been used instead of a wheel, this might have been a great success. It was only a suggestion, perhaps untried; and in common with seamen and writers about that time the author allows only 5000 feet to a mile. Edward Wright's *Certain Errors in Navigation Detected and Corrected* (1610) gives much new and useful information, but the nearest allusion to the ship's speed is in the part translated from the Spanish of Roderigo Samorano, under the head of finding the ship's place on the chart, called the "point of imagination." "This point doth presuppose the knowledge of two things: to wit, the rhumb by which we have sailed, and that is known by the compass, and the leagues which we have run; and this hath no certainty, but is a little more or less than a good mariner according to his imagination supposeth that he hath sailed; whereof the said point took its name." In 1624 an edition of Gunter by Edward Weaver, after much valuable geometric information, proposes at chap. vi., in a long rambling manner, that an account should be kept of the ship's way. "The way that a ship maketh may be known to an old seaman by experience, by others it may be found," as he recommends, with the log-line or by known marks on the ship's side, bearing the proportion to a league or mile, that a certain number of seconds do to an hour. So far good; but he reckons a mile as 5866 feet (214 too little), and states that seamen count in paces of 5 feet each, and 1000 to a mile, *i. e.*, only 5000 feet. He also proposes to divide the degrees into one hundred parts, each to be called "centesmes." The whole subject is treated as a new thing. It is stated by Purchas (1625) that Christopher Columbus (1492) deceived his crew with respect to the distance sailed from home, and that "even the pilots did not know how far they had gone" as they glided so smoothly with a continuous fair wind. Had any kind of log been hove, the ship's speed would have been publicly known. Mr. Burnaby (*Ancient Geography*, p. 554) states that "no ancient writer has preserved any account of the mode in which ancient navigators computed distance." Following such an authority and the quotations above, we may safely agree with the statement of Purchas that it was first used in 1607. Also we know that it did not become general till many years after. In one of our best works on navigation, printed in 1843, the log is inaccurately described.

If we are surprised that so many centuries passed, and that long voyages were made, after the discovery of the compass, without any means of measuring the

distance sailed, we may be almost as much so at the diversity of opinion which prevailed among seamen with regard to the length of the log-line and the length of a mile. At the present day the principle upon which this log is arranged is easily understood. The mean degree of the meridian (see vol. x. p. 177) is assumed to be 69·09 statute miles, which gives 6080 feet to the mean nautical mile,—an estimate sufficiently accurate for navigating upon any part of the sphere. The distances upon the log-line being marked by pieces of line placed between the strands and carrying the requisite number of knots, this has given the name of knot to the nautical mile. The line is marked to knots and half knots (a single knot) only; the intermediate fractions are estimated. Two measurements are now in common use; that in the British navy is 47 feet 3 inches of line for each knot made per hour, which corresponds with a twenty-eight second glass,—thus $(28 \times 6080) \div 3600 = 47{,}288$ feet; in the merchant service a knot is 50 feet 7 inches, which is the correct proportion to a mile with the half minute glass. When a ship is going more than five or six knots, a short glass is used, fourteen or fifteen seconds, then the indications by the line are doubled. The shorter measure was probably chosen in consequence of the custom in vogue till about 1833 of marking the run on the log-board, or book, in knots and fathoms (or sea furlongs); the fractions are now invariably entered as tenths. The whole length of line is 60 to 80 fathoms, according to the speed anticipated; 10 to 20 fathoms of which is allowed as stray line, that the log ship may be in a fair position, before the rag of bunting called the turn mark passes the hand. The line should be stretched and well wet before it is measured, and should be remeasured every day at sea. The inner end of the line is made fast to a light reel upon which it is wound.

The "log-ship" (fig. 1) is a piece of wood about ½ inch thick and the fourth part of a circle, having a radius of 5 or 6 inches, weighted with lead round the curve in order to keep it upright in the water, but not to sink it. Two holes are bored, about 1½ inches from the lower angles; through one a short piece of line is passed and knotted; the other end of the line has a bone or hard peg spliced to it, which is inserted in the other hole, thus forming a span by which it is attached to the log-line, and hangs square.

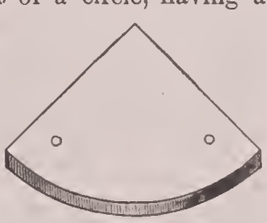

Fig. 1.

When the log is used, a man holds the reel over his head, the officer places the peg in the log-ship, and throws it well clear of the wake, then allows it to run the "stray line" off without assistance, steadying it just before the turn mark comes to hand; as the mark passes he calls to his assistant with the glass to "turn." As the sand runs pay out freely till the word "stop" is expected, then bring the line into a state of tension similar to what it was in when the turn mark passed. At the word "stop" nip the line instantly, count the nearest knots, and estimate the tenths. When the line is stopped the strain should cause the peg to draw from the log-ship, and it can easily be hauled in. In ships of war it is hove every hour. The value of the operation depends, of course, entirely upon the care bestowed.

Ground-Log.—In large rivers, such as Rio de la Plata, where a strong current runs, and shoals are found out of the sight of land, a lead of four or five pounds weight is used instead of the log-ship; the lead rests on the bottom, the line and sand-glass being used in a manner similar to that above described. This is called the ground-log, and indicates the speed at which the ship is passing over the ground, irrespective of currents or tides; it will show also the lateral effect of current as it is hauled in; this is the only log which can do so.

The sand-glasses are very primitive contrivances for measuring the requisite number of seconds; they are much affected by damp and change of temperature, and no reliance can be placed on their accuracy. In 1868 a timepiece sounding a gong at the required intervals was devised by the late Admiral Sir Walter Tarleton, and was tried on board some of Her Majesty's ships, but failed after a short time from damp or other causes. The writer of this article was then attempting to produce a log-gong, but abandoned it on being told that they could be obtained below his estimated cost.

Screw Logs.—In 1725 Henry de Saumarez described a machine which was to supersede the ordinary log. This was on the principle of the screw, having vanes which caused it to revolve and communicate a rotary motion to a piece of rope; this most probably went inboard to clockwork; hence the failure. Mr. Smeaton made many experiments about 1751; he found the results very irregular, especially at high velocities, just as the writer of this article did with one of Massey's flies and a line or wire attached to a spindle, supported by large friction rollers inboard; both experiments were dead failures on account of the friction. In 1773 two screw logs were tried on board H. M. ship "Racehorse" during a short voyage to the Polar Sea; each was made to communicate motion to a counter inboard. In 1792 Mr. Gower took out a patent for a screw log. None of these experiments were sufficiently successful to gain the confidence of seamen.

We see that the principle was not new in 1834 when Mr. Massey patented a screw log, which has been so generally adopted that it deserves special notice and description. Though Massey took out other patents, and others have followed with modifications, the principle of all is the same, and likely to remain in use with the "common log"

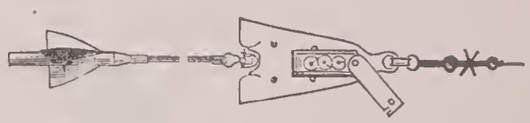

Fig. 2.

for many years to come. Massey fitted his log to the sternpost of a few vessels, a vertical spindle conveying the rotations of the fly to a register in the cabin above, but it did not answer.

The log of 1836 which came into general use is represented in fig. 2. It consists of two parts united by 2 or 3 feet of rope. The "fly" consists of a hollow copper cylinder about 9 or 10 inches long with four fins or blades placed at a given angle, causing it to rotate once in a certain distance. The rope is attached to the fly and to a spindle which freely revolves in a brass box; an endless screw acting upon a system of wheel-work records the fractions of a mile on one dial, units upon a second, and tens up to one hundred on the third, on the same principle with the index of a gas meter.

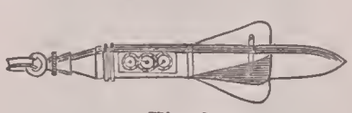

Fig. 3.

The last patent was for the "frictionless log" shown in fig. 3, which is similar to the former except that, by dispensing with the piece of rope and part of the heavy box, it is much more compact and less liable to foul,—an accident to which all logs when towed after a ship are very liable. Walker's harpoon log is very similar to the last of Massey's, but has a plate at the back in the shape of a harpoon to prevent the upper part from revolving. This log is now supplied to Her Majesty's ships. The fins or blades which cause the rotation in each of the logs above described are flat pieces of brass (not portions of a screw) soldered to a cylinder, which is hollow in order to diminish the tendency to sink when going slowly; but if the log be left overboard when the ship stops, the tow-line will allow it to sink about 100 feet, the pressure of water will then fill it, and there is no means provided for getting the water out. Screw logs will also at slow speeds hang obliquely and be useless. Mr. Friend tried a log with paddles protruding from a brass box instead of using a screw; but the plan was not adopted. However accurate the registering logs may be, an hourly log cannot be dispensed with, unless the ship be on one course during the whole twenty-four hours, or her speed be uniform; even then the old log and line should not be neglected. Both Massey and Walker are now trying logs the rotators of which are towed, while the dials for registering are on the ship's stern.

Pressure Log.—In 1849 the Rev. E. L. Berthon patented a log (fig. 4), indicating the speed of the ship by means of the pressure of water due to the velocity acting upon a

tube about ¼ of an inch diameter in the clear, closed at the end, protruding some 8 inches below the ship's bottom, with an aperture of about an ⅛ of an inch in diameter in the front side, near the closed end. A vane was used to turn the aperture in the direction of the ship's progress (course and leeway combined). At the upper end of the same pipe a pointer indicated the amount of leeway. To take into account the effect which change of draught would produce, another pipe was used having the aperture in a neutral direction (41°30) with regard to the ship's progress, so that the water was neither forced in nor drawn out. The two pipes communicated with air vessels, which were allowed to be about half full of water; thence two flexible tubes conveyed the pressure to the ends of an inverted siphon partly filled with mercury, one leg of which forms a glass index tube, a graduated scale being placed behind it, calculated upon the principle that the pressure will increase according to the square of the velocity. As the specific gravity of mercury is so great, the scale even up to 16 knots is brought within a convenient compass; and it can be hung in gimbals (as a barometer) in any part of the ship. The leeway indicator in more recent fittings has been abandoned. The writer of this article first saw it in one of the Jersey packets, when she was steaming about 13 knots; it appeared to be very sensitive, and he was strongly impressed in its favor. For details respecting this log see paper by Vaughan Pendred, before the Society of Engineers, December 6, 1869.

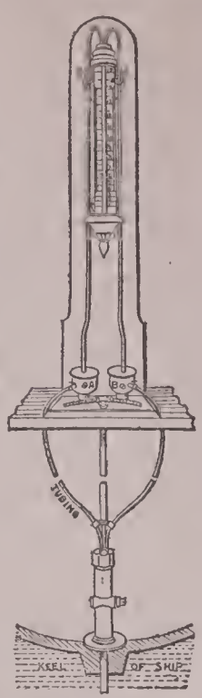

Fig. 4.

The motions or disturbances imparted to the water by the body of the ship passing through it at high velocity must vitiate in a great degree all attempts to measure the speed by instruments placed near the hull of the ship, and under varying circumstances of draught, speed, and foulness of bottom. For the results of experiments and opinions on this point, by the late William Froude, F. R. S., and Mr. R. Edmund Froude, see *Brit. Assoc. Rep.*, 1874, p. 225, and 1879, p. 210.

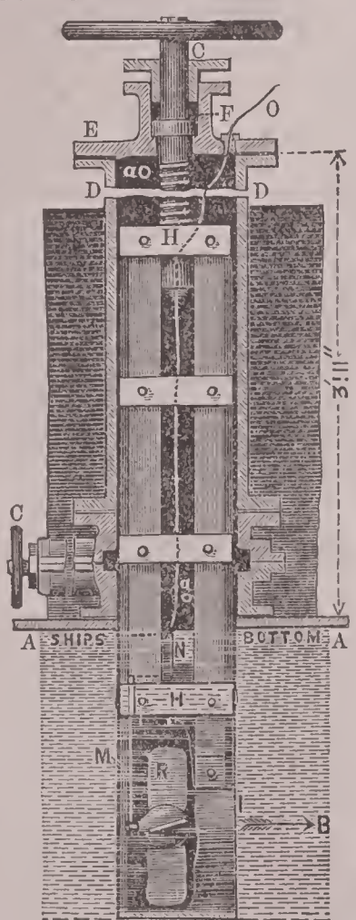

Fig. 5.

Electric Log. — In the chronological order in which we have taken various descriptions of log, the last deserving notice is Kelway's "electric log," the only such log known to the public. Its chief feature is the making and breaking of an electric circuit by means of a screw revolving in the water and an electric battery connected with the step motion indicator. One of the difficulties to be overcome was that of securing a chamber wherein to form the electric contacts, which should remain watertight under the pressure due to its depth below the surface of the sea, particularly in the event of the ship stopping and suffering it to sink when being towed with 50 fathoms of line. Mr. Kelway now believes that he has overcome that difficulty, and his log has been tried on board several of Her Majesty's ships at Portsmouth, with satisfactory results, a screw similar to Massey's being towed, while in electric connection with a dial on board.

What is considered by Mr. Kelway to be an improved application of the principle is now (1882) on view in the International Exhibition at the Crystal Palace. It is intended that a hole should be cut in the ship's bottom, by preference in the engine-room, large enough to allow a short cylinder (fig. 5) containing the screw K to pass down below the ship's bottom. The cylinder is open in the fore-and-aft line and attached to a cage H, which is drawn up or lowered by means of a large screw G working through a stuffing box F. The iron box D containing the cage is 4 feet in height, made in three parts; the lower part (high enough to receive a sluice valve C) is to be bolted to the ship's bottom, and must, with the rest of the box, be nearly as strong; the central part is secured to the valve box and covered by a lid E, there being space enough above the sluice valve for the cage and screw.

To place the log, let the sluice valve C be lightly closed; open two small taps to let the water out of the box and to prove that the valve is acting. Open the lid, run the lowering screw through the cage, place it, secure the lid, open the sluice valve, and lower the rotator to the desired distance. The blades of the rotator are portions of a true screw. An endless screw on the spindle of the rotator communicates the revolutions to a vertical spindle M, which moves a train of wheels in a watertight box N; the last of these wheels revolves once in a mile, and on the same spindle is a wheel having eight ratchet teeth, which by moving a lever complete an electric current, which passes by the wire O to a dial placed in any part of the ship, sounding a bell and causing one hand of the dial to make a step and mark an eighth; one revolution indicates a mile, and other dials carry the register up to 100 miles. This form of electric log has, however, the disadvantage pointed out as affecting the Berthon or any log placed under the hull of a ship.

The electric towing log (by Kelway) promises to show continuously on board the ship what she is doing, while keeping a record of what has been done. A rating table would be at the dial, in any part of the ship; or several dials could be worked by the same electric current. It will be exposed to the danger of fouling seaweed, etc., as other towing logs are.

The logs now generally used are Massey's, Walker's, and a few of Berthon's, generally in conjunction with the old log-ship and line. (H. A. M.)

LOGAN, John (1748–88), a Scottish poet of some reputation, was born in 1748, and was son of George Logan, a farmer at Soutra, in East Lothian. Being destined for the church, he was in 1762 sent to study at the university of Edinburgh. After finishing his course, Logan was in 1768–69 tutor at Ulbster to the well-known Sir John Sinclair, and in 1770 he edited some of the poems of his college friend Michael Bruce (*q. v.*). This publication was for the benefit of Bruce's parents, who were in humble circumstances. In order to make up a volume he inserted some poems of his own, with some from other sources, and in his preface he stated that these could be easily distinguished without any names being attached. Of the seventeen pieces in the volume five were by Bruce, two by Bruce and Logan, eight by Logan, one by Sir James Foulis, and of one the authorship is unknown. One of the poems by Logan was "The Ode to the Cuckoo."

In 1770 Logan was licensed as a preacher by the presbytery of Edinburgh, and in 1771 was presented to the charge of South Leith, but was not inducted till 1773. In 1779 he delivered a course of lectures on the philosophy of history in St. Mary's Chapel, Edinburgh. An analysis of these lectures was published in 1781 under the title of *Elements of the Philosophy of History*, and was followed by one of the lectures *On the Manners and Government of Asia*, 1781.

Logan was an active member of the committee of the General Assembly of the Church of Scotland appointed in 1775 to revise the "Translations and Paraphrases" drawn up in 1745 for use in private families, and to adapt them for public worship. The committee finished its labors in 1781, and their collection of paraphrases is still in use. Eleven of them are the composition of Logan, and others were revised or altered by him. In the same year he published his poems in a volume which attracted so much attention that a second edition was issued in 1782. It also included the "Ode to the Cuckoo," with which Edmund Burke was so pleased that when in Edinburgh he

sought out Logan and complimented him as the author of the finest ode in the English language.

In 1783 he published a tragedy called *Runnamede*, which met with little success. In 1786 he resigned his charge at South Leith, retaining part of his stipend. He then went to London, where he devoted himself to literature. He was engaged on the management of the *English Review*, and in 1788 published a pamphlet on the charges against Warren Hastings. He died in December, 1788.

A work on ancient history, published that year under the name of Dr. Rutherford, rector of an academy at Uxbridge, is believed to have been the lectures written by Logan. His sermons were published in 1790-91, in two volumes, and have been several times reprinted. His poems were collected and published in 1812, with a memoir understood to be by the Rev. R. Douglas of Galashiels.

About forty years after Logan's death what may be called the Bruce-Logan controversy arose by the publication in 1836 of the life of Michael Bruce, prefixed to an edition of his poems by the Rev. Dr. MacKelvie. In this work there is claimed for Bruce the authorship of sixteen of the pieces in the volume issued by Logan in 1770. Logan was at the same time charged with having retained some of Bruce's MSS. entrusted to him, which he used in the revision of the paraphrases. These statements have been reiterated with much abuse of Logan in a memoir of Bruce prefixed to an edition of his works published in 1865, by the Rev. Dr. Grosart. In this edition the paraphrases written by Logan are inserted as having been written by Bruce. The evidence, however, brought against Logan in these biographies of Bruce, being nearly altogether of a hearsay character, is not of much value, and it may be urged that Logan was not blamed during his life for any such literary delinquencies. If anything can be brought against him with justice, it is his publishing as his own, with very few alterations, the second Paraphrase, which is the composition of Dr. Doddridge.

Within the last few years the various pieces in the volume of Bruce's poems issued by Logan in 1770 have been subjected to careful criticism, and the statements made from personal knowledge by the Rev. Dr. Robertson of Dalmeny, the college friend of Bruce and Logan, who was often referred to on the subject, must be held to be substantially correct. These will be found in a *brochure* by Dr. David Laing, *Ode to the Cuckoo* (Edinburgh, 1770), *with remarks on its authorship, in a letter to J. C. Shairp*, LL.D., 1873. See also a paper by J. Small in the *Brit. and For. Evan. Rev.*, 1877, and especially two papers by the Rev. R. Small, *ibid.*, 1878.

LOGANSPORT, capital of Cass county, Indiana, U. S., is situated at the confluence of the Wabash and the Eel rivers, and on the Wabash and Erie canal, 75 miles north-west of Indianapolis. It is an important railway junction, and the trading-centre of an extensive agricultural district—dealing in grain, pork, and timber (poplar and black walnut). The Pittsburg, Cincinnati, and St. Louis railroad maintains at this point large carriage-works, occupying 25 acres, and employing 600 men. The population was 16,204 in 1900.

LOGARITHMS. The definition of a logarithm is as follows:—if a, x, m are any three quantities satisfying the equation $a^x = m$, then a is called the base, and x is said to be the logarithm of m to the base a. This relation between x, a, m, may be expressed also by the equation $x = \log_a m$.

Properties.—The principal properties of logarithms are given by the equations

$$\log_a (mn) = \log_a m + \log_a n, \quad \log_a \frac{m}{n} = \log_a m - \log_a n,$$

$$\log_a m^r = r \log_a m, \quad \log_a \sqrt[r]{m} = \frac{1}{r} \log_a m,$$

which may be readily deduced from the definition of a logarithm. It follows from these equations that the logarithm of the product of any number of quantities is equal to the sum of the logarithms of the quantities, that the logarithm of the quotient of two quantities is equal to the logarithm of the numerator diminished by the logarithm of the denominator, that the logarithm of the rth power of a quantity is equal to r times the logarithm of the quantity and that the logarithm of the rth root of a quantity is equal to $\frac{1}{r}$th of the logarithm of the quantity.

Logarithms were originally invented for the sake of abbreviating arithmetical calculations, as by their means the operations of multiplication and division may be replaced by those of addition and subtraction, and the operations of raising to powers and extraction of roots by those of multiplication and division. For the purpose of thus simplifying the operations of arithmetic, the base is taken equal to 10, and use is made of tables of logarithms in which the values of x, the logarithm, corresponding to values of m, the number, are tabulated. The logarithm is also a function of frequent occurrence in analysis, being regarded as a known and recognized function like $\sin x$ or $\tan x$; but in mathematical investigations the base generally employed is not 10, but a certain quantity usually denoted by the letter e, of value 2.71828 18284 . . . .

Thus in arithmetical calculations if the base is not expressed it is understood to be 10, so that $\log m$ denotes $\log_{10} m$; but in analytical formulæ it is understood to be e.

The logarithms to base 10 of the first twelve numbers to 7 places of decimals are

$\log 1 = 0{\cdot}0000000$	$\log 5 = 0{\cdot}6989700$	$\log 9 = 0{\cdot}9542425$
$\log 2 = 0{\cdot}3010300$	$\log 6 = 0{\cdot}7781513$	$\log 10 = 1{\cdot}0000000$
$\log 3 = 0{\cdot}4771213$	$\log 7 = 0{\cdot}8450980$	$\log 11 = 1{\cdot}0413927$
$\log 4 = 0{\cdot}6020600$	$\log 8 = 0{\cdot}9030900$	$\log 12 = 1{\cdot}0791812$

The meaning of these results is that

$$1 = 10^0, \quad 2 = 10^{0{\cdot}3010300}, \quad 3 = 10^{0{\cdot}4771213}, \ \ldots$$
$$10 = 10^1, \quad 11 = 10^{1{\cdot}0413927}, \quad 12 = 10^{1{\cdot}0791812}.$$

The integral part of a logarithm is called the index or characteristic, and the fractional part the mantissa. When the base is 10, the logarithms of all numbers in which the digits are the same, no matter where the decimal point may be, have the same mantissa; thus, for example,

$$\log 2{\cdot}5613 = 0{\cdot}4084604, \quad \log 25{\cdot}613 = 1{\cdot}4084604,$$
$$\log 2561300 = 6{\cdot}4084604, \text{ etc.}$$

In the case of fractional numbers (*i. e.*, numbers in which the integral part is 0) the mantissa is still kept positive, so that, for example,

$$\log {\cdot}25613 = \bar{1}{\cdot}4084604, \quad \log {\cdot}0025613 = \bar{3}{\cdot}4084604, \text{ etc.},$$

the minus sign being usually written over the characteristic, and not before it, to indicate that the characteristic only and not the whole expression is negative; thus

$$\bar{1}{\cdot}4084604 \text{ stands for } -1 + {\cdot}4084604.$$

The fact that when the base is 10 the mantissa of the logarithm is independent of the position of the decimal point in the number affords the chief reason for the choice of 10 as base. The explanation of this property of the base 10 is evident, for a change in the position of the decimal points amounts to multiplication or division by some power of 10, and this corresponds to the addition or subtraction of some integer in the case of the logarithm, the mantissa therefore remaining intact. It should be mentioned that in most tables of trigonometrical functions, the number 10 is added to all the logarithms in the table in order to avoid the use of negative characteristics, so that the characteristic 9 denotes in reality 1, $\bar{8}$ denotes $\bar{2}$, 10 denotes 0, etc. Logarithms thus increased are frequently referred to for the sake of distinction as *tabular logarithms*, so that the tabular logarithm = the true logarithm + 10.

In tables of logarithms of numbers to base 10 the mantissa only is in general tabulated, as the characteristic of the logarithm of a number can always be written down at sight, the rule being that, if the number is greater than unity, the characteristic is less by unity than the number of digits in the integral portion of it, and that if the number is less than unity the characteristic is negative, and is greater by unity than the number of ciphers between the decimal point and the first significant figure.

It follows very simply from the definition of a logarithm that

$$\log_a b \times \log_b a = 1; \quad \log_b m = \log_a m \times \frac{1}{\log_a b}.$$

The second of these relations is an important one, as it shows that from a table of logarithms to base a, the corresponding table of logarithms to base b may be deduced by multiplying all the logarithms in the former by the constant multiplier $\frac{1}{\log_a b}$, which is called the *modulus* of the system whose base is b with respect to the system whose base is a.

The two systems of logarithms for which extensive tables have been calculated are the Napierian, or hyperbolic, or natural system, of which the base is e, and the Briggian, or decimal, or common system, of which the base is 10; and we see that the logarithms in the latter system may be deduced from those in the former by multiplication by the constant multiplier $\frac{1}{\log_e 10}$, which is called the modulus of the common system of logarithms. The numerical value of this modulus is 0·43429 44819 03251 82765 11289 . . . , and the value of its reciprocal, $\log_e 10$ (by multiplication by which Briggian logarithms may be converted into Napierian logarithms) is 2·30258 50929 94045 68401 79914. . . .

The quantity denoted by e is the series,

$$1 + \frac{1}{1} + \frac{1}{1.2} + \frac{1}{1.2.3} + \frac{1}{1.2.3.4} + \cdots$$

the numerical value of which is,

2·71828 18284 59045 23536 02874 . . .

The mathematical function $\log x$, or $\log_e x$, is one of the small group of transcendental functions, consisting only of the circular functions (direct and inverse) $\sin x$, $\cos x$, etc., $\arcsin x$, $\arccos x$, etc., e^x, and $\log x$, which are universally treated in analysis as known functions. It is the inverse of the exponential function e^x, the theory of which may be regarded as including that of the circular functions, since

$$\sin x = \frac{1}{2i}(e^{ix} - e^{-ix}), \quad \cos x = \tfrac{1}{2}(e^{ix} + e^{-ix}).$$

There is no series for $\log x$ proceeding either by ascending or descending powers of x, but there is an expansion for $\log(1+x)$, viz.:—

$$\log(1+x) = x - \tfrac{1}{2}x^2 + \tfrac{1}{3}x^3 - \tfrac{1}{4}x^4 + \text{etc.};$$

the series, however, is convergent for real values of x only when x lies between $+1$ and -1. Other formulæ which are deducible from this equation are given in the portion of this article relating to the calculation of logarithms.

We have also the fundamental formulæ—

(i.) Limit of $\frac{x^h - 1}{h}$, when h is indefinitely diminished, $= \log x$;

(ii.) $$\int \frac{dx}{x} = \log x + \text{const.}$$

Either of these results might be regarded as the definition of $\log x$; they may be readily connected with one another, for we have in general

$$\int x^n dx = \frac{x^{n+1}}{n+1} + \text{const.};$$

but if $n = -1$, this formula no longer gives a result. Putting, however, $n = -1 + h$, where h is indefinitely small, we have

$$\int \frac{dx}{x} = \frac{x^h}{h} + \text{const.} = \frac{x^h - 1}{h} + \text{const.} = \log x + \text{const. by (i.)}.$$

The result (ii.) establishes a relation, which is of historical interest, between the logarithmic function and the quadrature of the hyperbola, for, by considering the equation of the hyperbola in the form $xy = \text{const.}$, we see at once that the area included between the arc of a hyperbola, its nearest asymptote, and two ordinates drawn parallel to the other asymptote from points on the first asymptote distant a and b from their point of intersection is proportional to $\log \frac{b}{a}$.

The function $\log x$ is not a *uniform* function, that is to say, if x denotes a complex variable of the form $a + ib$, and if complex quantities are represented in the usual manner by points in a plane, then it does not follow that if x describes a closed curve $\log x$ also describes a closed curve; in fact we have

$$\log(a + ib) = \log \sqrt{(a^2 + b^2)} + i(\alpha + 2n\pi),$$

where α is a determinate angle, and n denotes any integer. Thus, even when the argument is real, $\log x$ has an infinite number of values; for, putting $b = 0$ and taking a positive, in which case $\alpha = 0$, we obtain for $\log a$ the infinite system of values $\log a + 2n\pi i$. It follows from this property of the function that we cannot have for $\log x$ a series which shall be convergent for all values of x, as is the case with $\sin x$, $\cos x$, and e^x; as such a series could only represent a uniform function, and in fact the equation

$$\log(1+x) = x - \tfrac{1}{2}x^2 + \tfrac{1}{3}x^3 - \tfrac{1}{4}x^4 + \text{etc.},$$

is true only when the analytical modulus of x is less than unity.

The notation $\log x$ is generally employed in English works, but Continental writers usually denote the function by lx or $\lg x$.

History.—The invention of logarithms has been accorded to John Napier, baron of Merchiston, in Scotland, with a unanimity which is rare with regard to important scientific discoveries. The first announcement was made in Napier's *Mirifici logarithmorum canonis descriptio* (Edinburgh, 1614), which contains an account of the nature of logarithms, and a table giving natural sines and their logarithms for every minute of the quadrant to seven or eight figures. These logarithms are not what would now be called Napierian or hyperbolic logarithms (*i. e.*, logarithms to the base e), though closely connected with them, the relation between the two being

$$e^l = 10^7 e^{-\frac{L}{10^7}}, \text{ or } L = 10^7 \log_e 10^7 - 10^7 l,$$

where l denotes the logarithm to base e and L denotes Napier's logarithm. The relation between N (a sine) and L its Napierian logarithm is therefore

$$N = 10^7 e^{-\frac{L}{10^7}},$$

and the logarithms decrease as the sines increase. Napier died in 1617, and his posthumous work *Mirifici logarithmorum canonis constructio*, explaining the mode of construction of the table, appeared in 1619, edited by his son.

Henry Briggs, then professor of geometry at Gresham College, London, and afterwards Savilian professor of geometry at Oxford, admired the *Canon mirificus* so much that he resolved to visit Napier. In a letter to Ussher he writes, "Naper, lord of Markinston, hath set my head and hands at work with his new and admirable logarithms. I hope to see him this summer, if it please God; for I never saw a book which pleased me better, and made me more wonder." Briggs accordingly visited Napier in 1615, and stayed with him a whole month. He brought with him some calculations he had made, and suggested to Napier the advantages that would result from the choice of 10 as a base, having explained them previously in his lectures at Gresham College, and written to Napier on the subject. Napier said that he had already thought of the change, and pointed out a slight improvement, viz., that the characteristics of numbers greater than unity should be positive and not negative, as suggested by Briggs. In 1616 Briggs again visited Napier and showed him the work he had accomplished, and, he says, he would gladly have paid him a third visit in 1617 had Napier's life been spared.

Briggs's *Logarithmorum chilias prima* was published, probably privately, in 1617, after Napier's death, as in the short preface he states that why his logarithms are different from those introduced by Napier "sperandum, ejus librum posthumum abunde nobis propediem satisfacturum." The *liber posthumus* was the *Canonis constructio* already mentioned. This work of Briggs's, which contains the first published table of decimal or common logarithms, is only a small octavo tract of sixteen pages,

and gives the logarithms of numbers from unity to 1000 to 14 places of decimals. There is no author's name, place, or date. The date of publication is, however, fixed as 1617 by a letter from Sir Henry Bourchier to Ussher, dated December 6, 1617, containing the passage—"Our kind friend, Mr. Briggs, hath lately published a supplement to the most excellent tables of logarithms, which I presume he has sent to you." Briggs's tract of 1617 is extremely rare, and has generally been ignored or incorrectly described. Hutton erroneously states that it contains the logarithms to 8 places, and his account has been followed by most writers. There is a copy in the British Museum.

Briggs continued to labor assiduously at the calculation of logarithms, and in 1624 published his *Arithmetica logarithmica*, a folio work containing the logarithms of the numbers from 1 to 20,000, and from 90,000 to 100,000 (and in some copies to 101,000) to 14 places of decimals. The table occupies 300 pages, and there is an introduction of 88 pages relating to the mode of calculation of the tables, and the application of logarithms.

There was thus left a gap between 20,000 and 90,000, which was filled up by Adrian Vlacq, who published at Gouda, in Holland, in 1628, a table containing the logarithms of the numbers from unity to 100,000 to 10 places of decimals. Having calculated 70,000 logarithms and copied only 30,000, Vlacq would have been quite entitled to have called his a new work. He designates it, however, only a second edition of Briggs's *Arithmetica logarithmica*, the title running *Arithmetica logarithmica sive logarithmorum chiliades centum, . . . Editio secunda aucta per Adrianum Vlacq, Goudanum.* This table of Vlacq's was published, with an English explanation prefixed, at London in 1631 under the title *Logarithmicall Arithmetike . . . London, printed by George Miller*, 1631. There are also copies with a French title page and introduction (Gouda, 1628).

Briggs had himself been engaged in filling up the gap, and in a letter to Pell, written after the publication of Vlacq's work, and dated October 25, 1628, he says:—

"My desire was to have those chiliades that are wantinge betwixt 20 and 90 calculated and printed, and I had done them all almost by my selfe, and by some frendes whom my rules had sufficiently informed, and by agreement the busines was conveniently parted amongst us; but I am eased of that charge and care by one Adrian Vlacque, an Hollander, who hathe done all the whole hundred chiliades and printed them in Latin, Dutche, and Frenche, 1000 bookes in these 3 languages, and hathe sould them almost all. But he hathe cutt off 4 of my figures throughout; and hathe left out my dedication, and to the reader, and two chapters the 12 and 13, in the rest he hath not varied from me at all."

The original calculation of the logarithms of numbers from unity to 101,000 was thus performed by Briggs and Vlacq between 1615 and 1628. Vlacq's table is that from which all the hundreds of tables of logarithms that have subsequently appeared have been derived. It contains of course many errors, which have gradually been discovered and corrected in the course of the two hundred and fifty years that have elapsed, but no fresh calculation has been published. The only exception is Mr. Sang's table (1871), part of which was the result of an original calculation.

The first calculation or publication of Briggian or common logarithms of trigonometrical functions was made in 1620 by Gunter, who was Briggs's colleague as professor of astronomy in Gresham College. The title of Gunter's book, which is very scarce, is *Canon triangulorum*, and it contains logarithmic sines and tangents for every minute of the quadrant to 7 places of decimals.

The next publication was due to Vlacq, who appended to his logarithms of numbers in the *Arithmetica logarithmica* of 1628 a table giving log sines, tangents, and secants for every minute of the quadrant to 10 places; these were obtained by calculating the logarithms of the natural sines, etc., given in the *Thesaurus Mathematicus* of Pitiscus (1613).

During the last years of his life Briggs devoted himself to the calculation of logarithmic sines, etc., and at the time of his death in 1631 he had all but completed a logarithmic canon to every hundredth of a degree. This work was published by Vlacq at his own expense at Gouda in 1633, under the title *Trigonometria Britannica*. It contains log sines (to 14 places) and tangents (to 10 places), besides natural sines, tangents, and secants, at intervals of a hundredth of a degree. In the same year Vlacq published at Gouda his *Trigonometria artificialis*, giving long sines and tangents to every 10 seconds of the quadrant to 10 places. This work also contains the logarithms of the numbers from unity to 20,000 taken from the *Arithmetica logarithmica* of 1628. Briggs appreciated clearly the advantages of a centesimal division of the quadrant, and by dividing the degree into hundredth parts instead of into minutes, made a step towards a reformation in this respect, and but for the appearance of Vlacq's work the decimal division of the degree might have become recognized, as is now the case with the corresponding division of the second. The calculation of the logarithms not only of numbers but also of the trigonometrical functions is therefore due to Briggs and Vlacq; and the results contained in their four fundamental works—*Arithmetica logarithmica* (Briggs), 1624; *Arithmetica logarithmica* (Vlacq), 1628; *Trigonometria Britannica* (Briggs), 1633; *Trigonometria artificialis* (Vlacq), 1633—have never been superseded by any subsequent calculations.

A translation of Napier's *Descriptio* was made by Edward Wright, whose name is well known in connection with the history of navigation, and after his death published by his son at London in 1616 under the title *A Description of the admirable Table of Logarithmes* (12mo); the edition was revised by Napier himself. Both the *Descriptio* (1614) and the *Constructio* (1619) were reprinted at Lyons in 1620 by Bartholomew Vincent, who thus was the first to publish logarithms on the Continent.

Napier calculated no logarithms of numbers, and, as already stated, the logarithms invented by him were not to base e. The first logarithms to the base e were published by John Speidell in his *New Logarithmes* (London, 1619), which contains hyperbolic log sines, tangents, and secants for every minute of the quadrant to 5 places of decimals.

In 1624 Benjamin Ursinus published at Cologne a canon of logarithms exactly similar to Napier's in the *Descriptio* of 1614, only much enlarged. The interval of the arguments is $10''$, and the results are given to 8 places; in Napier's canon the interval is $1'$, and the number of places is 7. The logarithms are strictly Napierian, and the arrangement is identical with that in the canon of 1614. This is the largest Napierian canon that has ever been published.

Kepler took the greatest interest in the invention of logarithms, and in 1624 he published at Marburg a table of Napierian logarithms of sines, with certain additional columns to facilitate special calculations.

The first publication of Briggian logarithms on the Continent is due to Wingate, who published at Paris in 1625 his *Arithmétique logarithmétique*, containing seven-figure logarithms of numbers up to 1000, and log sines and tangents from Gunter's *Canon* (1620). In the following year, 1626, Denis Henrion published at Paris a *Traicté des Logarithmes*, containing Briggs's logarithms of numbers up to 20,001 to 10 places, and Gunter's log sines and tangents to 7 places for every minute. In the same year De Decker also published at Gouda a work entitled *Nieuwe Telkonst, inhoudende de Logarithme voor de Ghetallen beginnende van 1 tot 10,000*, which contained logarithms of numbers up to 10,000 to 10 places, taken from Briggs's *Arithmetica* of 1624, and Gunter's log sines and tangents to 7 places for every minute. Vlacq rendered assistance in the publication of this work, and the privilege is made out to him.

The preceding paragraphs contain a brief account of the main facts relating to the invention of logarithms. In describing the contents of the works referred to the language and notation of the present day have been adopted, so that for example a table to radius 10,000,000 is described as a table to 7 places, and so on. Also, although logarithms have been spoken of as to the base e, etc., it is to be noticed that neither Napier nor Briggs, nor any of their successors till long afterwards, had any idea of connecting logarithms with exponents.

The invention of logarithms and the calculation of the earlier tables form a very striking episode in the history of exact science, and, with the exception of the *Principia* of Newton, there is no mathematical work published in the country which has produced such important consequences, or to which so much interest attaches as to Napier's *Descriptio*. The calculation of tables of the natural trigonometrical functions may be said to have formed the work of the last half of the 16th century, and the great canon of natural sines for every 10 seconds to 15 places which had been calculated by Rheticus was published by Pitiscus only in 1613, the year before that in which the *Descriptio* appeared. In the construction of the natural trigonometrical tables England had taken no part, and it is remarkable that the discovery of the principles and the formation of the tables that were to revolutionize or supersede all the methods of calculation then in use should have been so rapidly effected and developed in a country in which so little attention had been previously devoted to such questions.

The only possible rival to Napier in the invention of logarithms is Justus Byrgius, who about the same time constructed a rude kind of logarithmic or rather anti-logarithmic table; but there is every reason to believe that Napier's system was conceived and perfected before that of Byrgius; and in date of publication Napier has the advantage by six years. The title of the work of Byrgius is *Arithmetische und geometrische Progress-Tabulen;* in his table he has log $1=0$ and log $10=230270022$. The only contemporary reference to Byrgius is contained in the sentence of Kepler, "Apices logistici Justo Byrgio multis annis ante editionem Neperianam viam præiverunt ad hos ipsissimos logarithmos," which occurs in the "Præcepta" prefixed to the *Tabulæ Rudolphinæ* (1627); the *apices* are the signs °, ′, ″, used to denote the orders of sexagesimal fractions. The system of Byrgius is greatly inferior to that of Napier, and it is to the latter alone that the world is indebted for the knowledge of logarithms. The claims of Byrgius are discussed in Kästner's *Geschichte der Mathematik*, vol. ii. p. 375, and vol. iii. p. 14; Montucla's *Histoire des Mathématiques*, vol. ii. p. 10; Delambre's *Histoire de l'Astronomie moderne*, vol. i. p. 560; De Morgan's article on "Tables" in the *English Cyclopædia;* and Mr. Mark Napier's *Memoirs of John Napier of Merchiston* (1834).

An account of the facts connected with the early history of logarithms is given by Hutton in his *History of Logarithms*, prefixed to all the early editions of his logarithmic tables, and also printed in vol. i. pp. 306–340 of his *Tracts* (1812); but unfortunately Hutton has interpreted all Briggs's statements with regard to the invention of decimal logarithms in a manner clearly contrary to their true meaning, and unfair to Napier. This has naturally produced retaliation, and Mr. Mark Napier has not only successfully refuted Hutton, but has fallen into the opposite extreme of attempting to reduce Briggs to the level of a mere computer. It seems strange that the relations of Napier and Briggs with regard to the invention of decimal logarithms should have formed matter for controversy. The statements of both agree in all particulars, and the warmest friendship subsisted between them. Napier at his death left his manuscripts to Briggs, and all the writings of the latter show the greatest reverence for him. The words that occur on the title page of the *Logarithmicall arithmetike* of 1631 are; "These numbers were first invented by the most excellent Iohn Neper, Baron of Merchiston; and the same were transformed, and the foundation and use of them illustrated with his approbation by Henry Briggs." No doubt the invention of decimal logarithms occurred both to Napier and to Briggs independently; but the latter not only first announced the advantage of the change, but actually undertook and completed tables of the new logarithms. For more detailed information relating to Napier, Briggs, and Vlacq, and the invention of logarithms, the reader is referred to the life of Briggs in Ward's *Lives of the Professors of Gresham College*, London, 1740; Thomas Smith's *Vitæ quorundam eruditissimorum et illustrium virorum* (Vita Henrici Briggii), London, 1707; Mr. Mark Napier's *Memoirs of John* Napier already referred to, and the same author's *Naperi libri qui supersunt* (1839); Hutton's *History;* De Morgan's article already referred to; Delambre's *Histoire de l'Astronomie Moderne;* the report on mathematical tables in the *Report of the British Association* for 1873; and the *Philosophical Magazine* for October and December, 1872, and May, 1873. It may be remarked that the date usually assigned to Briggs's first visit to Napier is 1616, and not 1615 as stated above, the reason being that Napier was generally supposed to have died in 1618; but it was shown by Mr. Mark Napier that the true date is 1617.

For a description of existing logarithmic tables, and the purposes for which they were constructed, the reader is referred to the article TABLES (MATHEMATICAL). In what follows only the most important events in the history of logarithms, subsequent to the facts connected with their invention and the original calculations, will be noticed.

Nathaniel Roe's *Tabulæ logarithmicæ* (1633) was the first complete seven-figure table that was published. It contains seven-figure logarithms of numbers from 1 to 100,000, with characteristics unseparated from the mantissæ, and was formed from Vlacq's table (1628) by leaving out the last three figures. All the figures of the number are given at the heads of the columns, except the last two, which run down the extreme columns,—1 to 50 on the left hand side, and 50 to 100 on the right hand side. The first four figures of the logarithms are printed at the tops of the columns. There is thus an advance half way towards the arrangement now universal in seven-figure tables. The final step was made by John Newton in his *Trigonometria Britannica* (1658), a work which is also noticeable as being the only extensive eight-figure table that has ever been published; it contains logarithms of sines, etc., as well as logarithms of numbers.

In 1705 appeared the original edition of Sherwin's tables, the first of the series of ordinary seven-figure tables of logarithms of numbers and trigonometrical functions such as are in general use now. The work went through several editions during the last century, and was at length superseded in 1785 by Hutton's tables, which have continued in successive editions to maintain their position up to the present time.

In 1717 Abraham Sharp published in his *Geometry Improv'd* the Briggian logarithms of numbers from 1 to 100, and of primes from 100 to 1100, to 61 places; these were copied into the later editions of Sherwin and other works.

In 1742 a seven-figure table was published in quarto form by Gardiner, which is celebrated on account of its accuracy and of the elegance of the printing. A French edition, which closely resembles the original, was published at Avignon in 1770.

In 1783 appeared at Paris the first edition of Callet's tables, which correspond to those of Hutton in England. These tables, which form perhaps the most complete and practically useful collection of logarithms for the general computer that has been published, have passed through many editions, and are still in use.

In 1794 Vega published his *Thesaurus logarithmorum completus*, a folio volume containing a reprint of the logarithms of numbers from Vlacq's *Arithmetica logarithmica* of 1628, and *Trigonometria artificialis* of 1633. The logarithms of numbers are arranged as in an ordinary seven-figure table. In addition to the logarithms reprinted from the *Trigonometria*, there are given logarithms for every second of the first two degrees, which were the result of an original calculation. Vega devoted great attention to the detection and correction of the errors in Vlacq's work of 1628. He

also published in 1797, in 2 vols. 8vo, a collection of logarithmic and trigonometrical tables which has passed through many editions, a very useful one volume stereotypo edition having been published in 1840 by Hülsse. The tables in this work may be regarded as to some extent supplementary to those in Callet.

If we consider only the logarithms of numbers, the main line of descent from the original calculations of Briggs and Vlacq is Roe, John Newton, Sherwin, Gardiner; there are then two branches, viz., Hutton founded on Sherwin and Callet on Gardiner, and the editions of Vega form a separate offshoot from the original tables. Among the most useful and accessible of modern ordinary seven-figure tables of logarithms of numbers and trigonometrical functions may be mentioned those of Bremiker, Schrön, and Bruhns. For logarithms of numbers only perhaps Babbage's table is the most convenient.

In 1871 Mr. Sang published a seven-figure table of logarithms of numbers extending from 20,000 to 200,000; and the logarithms of the numbers between 100,000 and 200,000 were calculated *de novo* by Mr. Sang as if logarithms had never been computed before. In tables extending from 10,000 to 100,000 the differences near the beginning of the table are large, and they are so numerous that the proportional parts must either be very crowded, or some of them have to be omitted; and to diminish this inconvenience many tables extend to 108,000. By beginning the table at 20,000 instead of at 10,000, the differences are halved in magnitude, while the number of them in a page is quartered. In this table multiples of the differences, instead of proportional parts, are given.

As regards the logarithms of trigonometrical functions, the next great advance on the *Trigonometria artificialis* took place more than a century and a half afterwards, when Michael Taylor published in 1792 his seven-decimal table of log sines and tangents to every second of the quadrant; it was calculated by interpolation from the *Trigonometria* to 10 places and then contracted to 7. On account of the great size of this table, and for other reasons, it never came into very general use, Bagay's *Nouvelles tables astronomiques* (1829), which also contains log sines and tangents to every second, being preferred, but this work is now difficult to procure. The only other logarithmic canon to every second that has been published forms the second volume of Shortrede's *Logarithmic Tables* (1849). It contains also proportional parts, and is the most complete and accessible table of logarithms for every second. Shortrede's tables originally appeared in 1844 in one volume, during the author's absence in India; but, not being satisfied with them in some respects, he made various alterations, and published a second edition in two volumes in 1849. There have been subsequent editions of the volume containing the trigonometrical canon. The work is an important one, and the pages are clear, although the number of figures on each is very great.

On the proposition of Caruot, Prieur, and Brunet, the French Government decided in 1784 that new tables of sines, tangents, etc., and their logarithms, should be calculated in relation to the centesimal division of the quadrant. Prony was charged with the direction of the work, and was expressly required "Non seulement à composer des tables qui ne laissassent rien à désirer quant à l'exactitude, mais à en faire le monument de calcul le plus vaste et le plus imposant qui eût jamais été exécuté ou même conçu." Those engaged upon the work were divided into three sections: the first consisted of five or six mathematicians, including Legendre, who were engaged in the purely analytical work, or the calculation of the fundamental numbers; the second section consisted of seven or eight calculators possessing some mathematical knowledge; and the third comprised seventy or eighty ordinary computers. The work, which was performed wholly in duplicate, and independently by two divisions of computers, occupied two years. As a consequence of the double calculation, there are two manuscripts in existence, one of which is deposited at the Observatory, and the other in the library of the Institute, at Paris. Each of the two manuscripts consists essentially of seventeen large folio volumes, the contents being as follows:—

Logarithms of numbers up to 200,000	8 vols.
Natural sines	1 "
Logarithms of the ratios of arcs to sines from 0r·00000 to 0r·05000, and log sines throughout the quadrant	4 "
Logarithms of the ratios of arcs to tangents from 0r·00000 to 0r·05000, and log tangents throughout the quadrant	4 "

The trigonometrical results are given for every hundred-thousandth of the quadrant (10″ centesimal or 3‴·24 sexagesimal) The tables were all calculated to 14 places, with the intention that only 12 should be published, but the twelfth figure is not to be relied upon. The tables have never been published, and are generally known as the *Tables du Cadastre*, or, in England, as the great French manuscript tables.

A very full account of the *Tables du Cadastre*, with an explanation of the methods of calculation, formulæ employed, etc., has been published by M. Lefort in vol. iv. of the *Annales de l'Observatoire de Paris*. The printing of the table of natural sines was once begun, and M. Lefort states that he has seen six copies, all incomplete, although including the last page. Babbage compared his table with the *Tables du Cadastre*, and M. Lefort has given in his paper just referred to most important lists of errors in Vlacq's and Briggs's logarithms of numbers which were obtained by comparing the manuscript tables with those contained in the *Arithmetica logarithmica* of 1624 and of 1628. These are almost the only uses that have been made of the French tables, the calculation of which involved so great an expenditure of time and money.

It may be mentioned here that the late Mr. John Thomson of Greenock made an independent calculation of the logarithms of numbers up to 120,000 to 12 places, and that the manuscript of the table was presented in 1874 to the Royal Astronomical Society by his sister. The table has been used to verify the errata which M. Lefort found in Vlacq and Briggs by means of the *Tables du Cadastre*. An account of Mr. Thomson's table, and of this and other comparisons between it and the printed tables, is to be found in the *Monthly Notices* of the Society, vol. xxxiv. pp. 447–75 (1874).

Although the *Tables du Cadastre* have never been published, other tables have appeared in which the quadrant is divided centesimally, the most important of these being Hobert and Ideler's *Nouvelles tables trigonométriques* (1799), and Borda and Delambre's *Tables trigonométriques décimales* (1800–1). The former work contains natural and log sines, cosines, tangents, and cotangents to 7 places, up to 3° (centesimal) at intervals of 10″ (centesimal), and thence to 50° at intervals of 1′. The latter gives log sines, cosines, tangents, and cosines for centesimal arguments, viz., from 0′ to 10′ at intervals of 10″, and from 0° to 50° at intervals of 10′, to 11 places, and also, in another table, log sines, cosines, tangents, cotangents, secants, and cosecants from 0° to 3° at intervals of 10″, and thence to 50° at intervals of 1′ to 7 places. After the work was printed it was read by Delambre with the *Tables du Cadastre*, and a number of last-figure errors which are given in the preface were thus detected. Callet's tables already referred to contain in a convenient form logarithms of trigonometrical functions for centesimal arguments.

Two tables of logarithms of numbers which have been recently published may be noticed, as they involve points of novelty. The first of these is Pineto's *Tables de logarithmes* (St. Petersburg, 1871). The tables are intended to give in a small space (56 pages) all the results that can be obtained from a complete ten-figure table by means of the following principle:—only the logarithms of the numbers from 1,000,000 to 1,011,000 are given directly, all other numbers being brought within the range of this table by multiplication by a factor, the logarithm of which factor is to be subtracted from the logarithm in the table. A list of the most convenient factors and their logarithms is given in a separate table. The principle of multiplying by a factor which is subsequently cancelled by subtracting its logarithm is one that is frequently employed in the calculation of logarithms, but the peculiarity of the present work is that it forms part of the process of using the table. The other tables, which occupy only ten pages, were published in a tract entitled *Tables de logarithmes à 12 décimales jusqu' à 434 milliards* by MM. Namur and Mansion at Brussels in 1877. The fact that the differences of the logarithms of numbers near to 434294 (these being the first figures of the modulus of the Briggian logarithms) commenced with the figures 100..., so that the interpolations in this part of the table are very easily and accurately performed, is ingeniously made use of. A table is given of logarithms of numbers near to 434294, and other numbers are brought within the range of the table by multiplication by one or two factors which are indicated.

In the ordinary tables of logarithms the natural numbers are all integers, while the logarithms tabulated are incommensurable. In an antilogarithmic table, the logarithms are exact quantities such as ·00001, ·00002, etc., and the numbers are incommensurable. The earliest and largest table of this kind that has been constructed is Dodson's *Antilogarithmic canon* (1742), which gives the numbers to 11 places, corresponding to the logarithms from ·00001 to ·99999 at intervals of ·00001. The only other extensive tables of the same kind that have been published occur in Shortrede's *Logarithmic tables* already referred to, and in Filipowski's *Table of antilogarithms* (1849). Both are

similar to Dodson's tables, from which they were derived, but they only give numbers to seven places.

The most elaborate table of hyperbolic logarithms that exists is due to Wolfram, a Dutch lieutenant of artillery. His table gives the logarithms of all numbers up to 2200, and of primes (and also of a great many composite numbers) from 2200 to 10,009, to 48 decimal places. The table appeared in Schulze's *Neue und erweiterte Sammlung logarithmischer Tafeln* (1778), and was reprinted in Vega's *Thesaurus* (1794), already referred to. Six logarithms omitted in Schulze's work, and which Wolfram had been prevented from computing by a serious illness, were published subsequently, and the table as given by Vega is complete. The largest hyperbolic table as regards range was published by Zacharias Dase at Vienna in 1850 under the title *Tafel der natürlichen Logarithmen der Zahlen.* It gives hyperbolic logarithms of numbers from 1000·0 to 10500·0 at intervals of ·1 to 7 places, with differences and proportional parts, arranged like an ordinary seven-figure table of Briggian logarithms. The table appeared in the thirty-fourth part (new series, vol. xiv.) of the *Annals of the Vienna Observatory* (1851); but separate copies were issued.

Hyperbolic antilogarithms are simple exponentials, *i. e.*, the hyperbolic antilogarithm of x is e^x. A seven-figure table of e^x and its Briggian logarithm from $x = ·01$ to $x = 10$ at intervals of ·01 is given in Hülsse's edition of Vega's *Sammlung*, and in other collections of tables; but by far the most complete table that has been published occurs in Gudermann's *Theorie der potenzial-oder cyklisch-hyperbolischen Functionen*, Berlin, 1833. This work consists of reprinted papers from Crello's *Journal*, and one of the tables contains the Briggian logarithms of the hyperbolic sine, cosine, and tangent of x from $x = 2$ to $x = 5$ at intervals of ·001 to 9 places, and from $x = 5$ to $x = 12$ at intervals of 0·01 to 10 places. Since the hyperbolic sine and cosine of x are respectively $\frac{1}{2}(e^x - e^{-x})$ and $\frac{1}{2}(e^x + e^{-x})$, the values of e^x and e^{-x} may be deduced from the results given in the table by simple addition and subtraction.

Logistic numbers is the old name for what would now be called ratios or fractions. Thus a table of $\log \frac{a}{x}$, where x is the argument and a a constant, is called a table of logistic or proportional logarithms; and since $\log \frac{a}{x} = \log a - \log x$ it is clear that the tabular results differ from those given in an ordinary table of logarithms only by the subtraction of a constant and a change of sign. The first table of this kind appeared in Kepler's *Chilias logarithmorum* (1624) already referred to. The object of a table of $\log \frac{a}{x}$ is to facilitate the working out of proportions in which the third term is a constant quantity a. In most collections of tables of logarithms, and especially those intended for use in connection with navigation, there occurs a small table of logistic logarithms in which $a = 3600''$ ($= 1°$ or 1^h), the table giving $\log 3600 - \log x$, and x being expressed in minutes and seconds. It is also common to find tables in which $a = 10800'' (= 3°$ or $3^h)$, and x is expressed in degrees (or hours), minutes, and seconds. Such tables are generally given to 4 or 5 places. The usual practice in books seems to be to call logarithms logistic when a is $3600''$, and proportional when a has any other value.

Gaussian logarithms are intended to facilitate the finding of the logarithms of the sum and difference of two numbers whose logarithms are known, the numbers themselves being unknown; and on this account they are frequently called addition and subtraction logarithms. The object of the table is in fact to give $\log (a \pm b)$ by only one entry when $\log a$ and $\log b$ are given. The utility of such logarithms was first pointed out by Leonelli in a book entitled *Supplément logarithmique*, printed at Bordeaux in the year XI. (1802–3); this work being very scarce, a reprint of it was published by M. J. Houel in 1876. Leonelli calculated a table to 14 places, but only a specimen of it which appeared in the *Supplément* was printed. The first table that was actually published is due to Gauss, and was printed in Zach's *Monatliche Correspondenz*, vol. xxvi. p. 498 (1812). Corresponding to the argument A it gives, to 5 places, B and C, where

$$A = \log x, \quad B = \log\left(1 + \frac{1}{x}\right), \quad C = \log(1 + x),$$

so that $C = A + B$.

We have identically

$$\log(a + b) = \log a + \log\left(1 - \frac{b}{a}\right)$$
$$= \log a + B \text{ (for argument } \log \tfrac{a}{b}\text{)};$$

and, in using the table, the rule is to take $\log a$ to be the larger of the two logarithms, and to enter the table with $\log a - \log b$ as argument; we then have $\log(a + b) = \log a + b$, or, if we please, $= \log b + C$. The formula for the difference is $\log(a - b) = \log b + A$ (argument sought in column C) if $\log a - \log b$ is greater than ·30103 and $= \log b - A$ (argument sought in column B) if $\log a - \log b$ is less than ·30103.

The principal tables of Gaussian logarithms are (1) Mathiessen, *Tafel zur bequemern Berechnung* (Altona, 1818), giving B and C for argument A to 7 places,—this table is not a convenient one; (2) Peter Gray, *Tables and Formulæ* (London, 1849), and *Addendum* (1870), giving full tables of C and $\log(1 - x)$ for argument A to 6 places; (3) Zech, *Tafeln der Additions- und Subtractions-logarithmen* (Leipsic, 1849), giving 7-place values of B for argument A, and 7-place values of C for argument B. These tables appeared originally in Hülsse's edition of Vega's *Sammlung* (1849); (4) Wittstein, *Logarithmes de Gauss* (Hanover, 1866), giving values of B for argument A to 7 places. This is a large table, and the arrangement is similar to that of an ordinary seven-figure table of logarithms.

In 1829 Widenbach published at Copenhagen a small table of modified Gaussian logarithms giving $\log \frac{x+1}{x-1}$ (= D) corresponding to A as argument; A and D are thus reciprocal, the relation between them being in fact $10^{A+D} = 10^A + 10^D + 1$, so that either A or D may be regarded as the argument.

Gaussian logarithms are chiefly useful in the calculations connected with the solution of triangles in such a formulæ as $\cot \frac{1}{2}C = \frac{a+b}{a-b} \tan(A - B)$, and in the calculation of life contingencies.

Calculation of Logarithms.—The name logarithm is derived from the words λόγων ἀριθμός, the number of the ratios, and the way of regarding a logarithm which justifies the name may be explained as follows. Suppose that the ratio of 10, or any other particular number, to 1 is compounded of a very great number of equal ratios, as for example 1,000,000, then it can be shown that the ratio of 2 to 1 is very nearly equal to a ratio compounded of 301,030 of these small ratios, or *ratiunculæ*, that the ratio of 3 to 1 is very nearly equal to a ratio compounded of 477,121 of them, and so on. The small ratio, or *ratiuncula*, is in fact that of the millionth root of 10 to unity, and if we denote it by the ratio of a to 1, then the ratio of 2 to 1 will be nearly the same as that of $a^{301,030}$ to 1, and so on; or, in other words, if a denotes the millionth root of 10, then 2 will be nearly equal to $a^{301,030}$, 3 will be nearly equal to $a^{477,121}$, and so on.

Napier's original work, the *Descriptio canonis* of 1614, contained, not logarithms of numbers, but logarithms of sines, and the relations between the sines and the logarithms were explained by the motions of points in lines, in a manner not unlike that afterwards employed by Newton in the method of fluxions. An account of the processes by which Napier constructed his table is given in the *Constructio canonis* of 1619. These methods apply, however, specially to Napier's own kind of logarithms, and are different from those actually used by Briggs in the construction of the tables in the *Arithmetica logarithmica*, although some of the latter are the same in principle as the processes described in an appendix to the *Constructio*. It may be observed that in the *Constructio* logarithms are called artificials, and this seems to have been the name first employed by Napier, but which he subsequently replaced by logarithms. It is to be presumed that he would have made the change of name also in the *Constructio*, had he lived to publish it himself.

The processes used by Briggs are explained by him in the preface to the *Arithmetica logarithmica* (1624). His method of finding the logarithms of the small primes, which consist in taking a great number of continued geometric means between unity and the given primes, may be described as follows. He first formed the table of numbers and their logarithms:

Number.	Logarithm.
10	1
3·162277 . .	0·5
1·778279 . . .	0·25
1·333521 . . .	0·125
1·154781 . . .	0·0625
. . .	. . .

each quantity in the left hand column being the square root of the one above it, and each quantity in the right hand column being the half of the one above it. To construct this table Briggs, using about thirty places of decimals, extracted the square root of 10 fifty-four times, and thus found that the logarithm of 1·00000 00000 00000 12781 91493 20032 35 was 0·00000 00000 00000 05551 11512 31257 82702, and that for numbers of this form (*i. e.*, for numbers beginning with 1 followed by fifteen ciphers, and then by seventeen or a less number of significant figures) the logarithms were proportional to these significant figures. He then by means of a simple proportion deduced that log 1·00000 00000 00000 (1) = 0·00000 00000 00000 04342 94481 90325 1804, so that, a quantity 1·00000 00000 00000 x (where x consists of not more than seventeen figures) having been obtained by repeated extraction of the square root of a given number, the logarithm of 1·00000 00000 00000 x could then be found by multiplying x by ·00000 00000 00000 04342 . . . . .

To find the logarithm of 2, Briggs raised it to the tenth power, viz., 1024, and extracted the square root of 1·024 forty-seven times, the result being 1·00000 00000 00000 16851 60570 53949 77. Multiplying the significant figures by 4342 . . . he obtained the logarithm of this quantity, viz., 0·00000 00000 00000 07318 55936 90623 9336, which multiplied by 2^{47} gave 0·01029 99566 39811 95265 277444, the logarithm of 1·024, true to 17 or 18 places. Adding the characteristic 3, and dividing by 10, he found (since 2 is the tenth root of 1024) log 2 = ·30102 99956 63981 195. Briggs calculated in a similar manner log 6, and thence deduced log 3.

It will be observed that in the first process the value of the modulus is in fact calculated from the formula

$$\frac{h}{10^h - 1} = \frac{1}{\log_e 10},$$

the value of h being $\frac{1}{2^{54}}$, and in the second process $\log_{10} 2$ is in effect calculated from the formula

$$\log_{10} 2 = \left(2^{\frac{10}{2^{47}}} - 1\right) \times \frac{1}{\log_e 10} \times \frac{2^{47}}{10}.$$

Briggs also gave methods of forming the mean proportionals or square roots by differences; and the general method of constructing logarithmic tables by means of differences is due to him.

The following calculation of log 5 is given as an example of the application of a method of mean proportionals. The process consists in taking the geometric mean of numbers above and below 5, the object being to at length arive at 5·000000. To every geometric mean in the column of numbers there corresponds the arithmetical mean in the column of logarithms. The numbers are denoted by A, B, C, etc., in order to indicate their mode or formation.

	Numbers.	Logarithms.
$A =$	1·000000	0·0000000
$B =$	10·000000	1·0000000
$C = \sqrt{(AB)} =$	3·162277	0·5000000

$Y = \sqrt{(VX)} =$	5·000003	0·6989702
$Z = \sqrt{(XY)} =$	5·000000	0·6989700

Great attention was devoted to the methods of calculating logarithms during the 17th and 18th centuries. The earlier methods proposed were, like those of Briggs, purely arithmetical, and for a long time logarithms were regarded from the point of view indicated by their name, that is to say, as depending on the theory of compounded ratios. The introduction of infinite series into mathematics effected a great change in the modes of calculation and the treatment of the subject. Besides Napier and Briggs, special reference should be made to Kepler (*Chilias*, 1624) and Mercator (*Logarithmotechnia*, 1668), whose methods were arithmetical, and to Newton, Gregory, Halley and Cotes, who employed series. A full and valuable account of these methods is given in Hutton's "Construction of Logarithms," which occurs in the introduction to the early editions of his *Mathematical Tables*, and also forms tract 21 of his *Mathematical Tracts* (vol. i., 1812). Many of the early works on logarithms were reprinted in the *Scriptores logarithmici* of Baron Maseres (6 vols. 4to, 1791–1807).

In the following account only those formulæ and methods will be referred to which would now be used in the calculation of logarithms.

Since

$$\log_e (1+x) = x - \tfrac{1}{2}x^2 + \tfrac{1}{3}x^3 - \tfrac{1}{4}x^4 + \text{etc.},$$

we have, by changing the sign of x,

$$\log_e (1-x) = -x - \tfrac{1}{2}x^2 - \tfrac{1}{3}x^3 - \tfrac{1}{4}x^4 - \text{etc.};$$

whence

$$\log_e \frac{1+x}{1-x} = 2(x + \tfrac{1}{3}x^3 + \tfrac{1}{5}x^5 + \text{etc.}),$$

and, therefore, replacing x by $\frac{p-q}{p+q}$,

$$\log_e \frac{p}{q} = 2\left\{\frac{p-q}{p+q} + \tfrac{1}{3}\left(\frac{p-q}{p+q}\right)^3 + \tfrac{1}{5}\left(\frac{p-q}{p+q}\right)^5 + \text{etc.}\right\},$$

in which the series is always convergent, so that the formula affords a method of deducing the logarithm of one number from that of another.

As particular cases we have, by putting $q = 1$,

$$\log_e p = 2\left\{\frac{p-1}{p+1} + \tfrac{1}{3}\left(\frac{p-1}{p+1}\right)^3 + \tfrac{1}{5}\left(\frac{p-1}{p+1}\right)^5 + \text{etc.}\right\},$$

and by putting $q = p+1$,

$$\log_e (p+1) - \log_e p = 2\left\{\frac{1}{2p+1} + \tfrac{1}{3}\frac{1}{(2p+1)^3} + \tfrac{1}{5}\frac{1}{(2p+1)^5} + \text{etc.}\right\};$$

the former of these equations gives a convergent series for $\log_e p$, and the latter a very convergent series by means of which the logarithm of any number may be deduced from the logarithm of the preceding number.

From the formula for $\log_e \frac{p}{q}$ we may deduce the following very convergent series for $\log_e 2$, $\log_e 3$, and $\log_e 5$, viz.:—

$$\log_e 2 = 2(7\mathrm{P} + 5\mathrm{Q} + 3\mathrm{R}),$$
$$\log_e 3 = 2(11\mathrm{P} + 8\mathrm{Q} + 5\mathrm{R}),$$
$$\log_e 5 = 2(16\mathrm{P} + 12\mathrm{Q} + 7\mathrm{R}),$$

where

$$\mathrm{P} = \frac{1}{31} + \tfrac{1}{3}\cdot\frac{1}{(31)^3} + \tfrac{1}{5}\cdot\frac{1}{(31)^5} + \text{etc.}$$

$$\mathrm{Q} = \frac{1}{49} + \tfrac{1}{3}\cdot\frac{1}{(49)^3} + \tfrac{1}{5}\cdot\frac{1}{(49)^5} + \text{etc.}$$

$$\mathrm{R} = \frac{1}{161} + \tfrac{1}{3}\cdot\frac{1}{(161)^3} + \tfrac{1}{5}\cdot\frac{1}{(161)^5} + \text{etc.}$$

The following still more convenient formulæ for the calculation of $\log_e 2$, $\log_e 3$, etc., are given by Professor J. C. Adams in the *Proceedings of the Royal Society*, vol. xxvii. (1878), p. 91. If

$$a = \log\frac{10}{9} = -\log\left(1 - \frac{1}{10}\right), \quad b = \log\frac{25}{24} = -\log\left(1 - \frac{4}{100}\right),$$

$$c = \log\frac{81}{80} = \log\left(1 + \frac{1}{80}\right), \quad d = \log\frac{50}{49} = -\log\left(1 - \frac{2}{100}\right),$$

$$e = \log\frac{126}{125} = \log\left(1 + \frac{8}{1000}\right),$$

then

$\log 2 = 7a - 2b + 3c$, $\log 3 = 11a - 3b + 5c$, $\log 5 = 16a - 4b + 7c$,

and

$$\log 7 = \tfrac{1}{2}(39a - 10b + 17c - d) \text{ or } = 19a - 4b + 8c + e,$$

and we have the equation of condition,

$$a - 2b + c = d + 2e.$$

By means of these formulæ Professor Adams has calculated the values of $\log_e 2$, $\log_e 3$, $\log_e 5$, and $\log_e 7$ to 260 places of decimals, and he has deduced the value of $\log_e 10$ and its reciprocal M, the modulus of the Briggian system of logarithms. The value of the modulus found by Professor Adams is

M = ·43429	44819	03251	82765	11289
	18916	60508	22943	97005	80366
	65661	14453	78316	58646	49208
	87077	47292	24949	33843	17483
	18706	10674	47663	03733	64167
	92871	58963	90656	92210	64662
	81226	58521	27086	56867	03295
	93370	86965	88266	88331	16360
	77384	90514	28443	48666	76864
	65860	85135	56148	21234	87653
	43543	43573	17247	48049	05993
	55353	05			

The values of the other logarithms are given in the paper referred to.

If the logarithms are Briggian all the series in the preceding formulæ must be multiplied by M, the modulus; thus, for example,

$$\log_{10}(1 + x) = \mathrm{M}(x - \tfrac{1}{2}x^2 + \tfrac{1}{3}x^3 + \tfrac{1}{4}x^4 + \text{etc.}),$$

and so on.

As has been stated, Abraham Sharp's table contains 61-decimal Briggian logarithms of primes up to 1100, so that the logarithms of all composite numbers whose greatest prime factor does not exceed this number may be found by simple addition; and Wolfram's table gives 48-decimal hyperbolic logarithms of primes up to 10,009. By means of these tables and of a factor table we may very readily obtain the Briggian logarithm of a number to 61 or a less number of places or of its hyperbolic logarithm to 48 or a less number of places in the following manner. Suppose the hyperbolic logarithm of the prime number 43,867 required. Multiplying by 50, we have $50 \times 43{,}867 = 2{,}193{,}350$, and on looking in Burkhardt's *Table des diviseurs* for a number near to this which shall have no prime factor greater than 10,009, it appears that

$$2{,}193{,}349 = 23 \times 47 \times 2029;$$

thus

$$43{,}867 = \tfrac{1}{50}(23 \times 47 \times 2029 + 1),$$

and therefore

$$\log_e 43{,}867 = \log_e 23 + \log_e 47 + \log_e 2029 - \log_e 50 + \frac{1}{2{,}193{,}349} - \tfrac{1}{2}\frac{1}{(2{,}193{,}349)^2} + \tfrac{1}{3}\frac{1}{(2{,}193{,}349)^3} - \text{etc.}$$

The first term of the series in the second line is

0·00000 04559 23795 07319 6286;

dividing this by $2 \times 2{,}193{,}349$ we obtain

0·00000 00000 00103 93325 3457,

and the third term is

0·00000 00000 00000 00003 1590,

so that the series =

0·00000 04559 23691 13997 4419;

whence, taking out the logarithms from Wolfram's table,

$\log_e 43{,}867 = 10{\cdot}68891\ 76079\ 60568\ 10191\ 3661.$

The principle of the method is to multiply the given prime (supposed to consist of 4, 5, or 6 figures) by such a factor that the product may be a number within the range of the factor tables, and such that, when it is increased by 1 or 2, the prime factors may all be within the range of the logarithmic tables. The logarithm is then obtained by use of the formula

$$\log_e(x + d) = \log_e x + \frac{d}{x} - \tfrac{1}{2}\frac{d^2}{x^2} + \tfrac{1}{3}\frac{d^3}{x^3} - \text{etc.},$$

in which of course the object is to render $\frac{d}{x}$ as small as possible. If the logarithm required is Briggian, the value of the series is to be multiplied by M.

If the number is incommensurable or consists of more than seven figures, we can take the first seven figures of it (or multiply and divide the result by any factor, and take the first seven figures of the result) and proceed as before. An application to the hyperbolic logarithm of π is given by Burkhardt in the introduction to his *Table des diviseurs* for the second million.

The best general method of calculating logarithms consists, in its simplest form, in resolving the number whose logarithm is required into factors of the form $1 - \cdot 1^r n$, where n is one of the nine digits, and making use of subsidiary tables of logarithms of factors of this form. For example, suppose the logarithm of 543839 required to twelve places. Dividing by 10^5 and by 5 the number becomes 1·087678, and resolving this number into factors of the form $1 - \cdot 1^r n$ we find that

$$543839 = 10^5 \times 5(1 - \cdot 1^2 8)(1 - \cdot 1^4 6)(1 - \cdot 1^5 6)(1 - \cdot 1^6 3)(1 - \cdot 1^7 3) \times (1 - \cdot 1^8 5)(1 - \cdot 1^9 7)(1 - \cdot 1^{10} 9)(1 - \cdot 1^{11} 3)(1 - \cdot 1^{12} 2)$$

where $1 - \cdot 1^2 8$ denotes $1 - \cdot 08$, $1 - \cdot 1^4 6$ denotes $1 - \cdot 0006$, etc., and so on. All that is required therefore in order to obtain the logarithm of any number is a table of logarithms, to the required number of places of $\cdot n$, $\cdot 9n$, $\cdot 99n$, $\cdot 999n$, etc., for $n = 1, 2, 3, \ldots 9$.

The resolution of a number into factors of the above form is easily performed. Taking, for example, the number 1·087678, the object is to destroy the significant figure 8 in the second place of decimals; this is effected by multiplying the number by $1 - \cdot 08$, that is, by subtracting from the number eight times itself advanced two places, and we thus obtain 1·00066376. To destroy the first 6 multiply by $1 - \cdot 0006$ giving 1·000663361744, and multiplying successively by $1 - \cdot 00006$ and $1 - \cdot 000003$, we obtain 1·000000357932, and it is clear that these last six significant figures represent without any further work the remaining factors required. In the corresponding antilogarithmic process the number is expressed as a product of factors of the form $1 + \cdot 1^n x$.

This method of calculating logarithms by the resolution of numbers into factors of the form $1 - \cdot 1^r n$ is generally known as Weddle's method, having been published by him in *The Mathematician* for November, 1845, and the corresponding method for antilogarithms by means of factors of the form $1 + (\cdot 1)^r n$ is known by the name of Hearn, who published it in the same journal for 1847. In 1846 Mr. Peter Gray constructed a new table to 12 places, in which the factors were of the form $1 - (\cdot 01)^r n$, so that n had the values 1, 2, . . . 99; and subsequently he constructed a similar table for factors of the form $1 + (\cdot 01)^r n$. He also discovered a method of applying a table of Hearn's form (*i. e.*, of factors of the form $1 + \cdot 1^r n$) to the construction of logarithms, and calculated a table of logarithms of factors of the form $1 + (\cdot 001)^r n$ to 24 places. This was published in 1876 under the title *Tables for the formation of logarithms and antilogarithms to twenty-four or any less number of places*, and contains the most complete and useful application of the method, with many improvements in points of detail. Taking as an example the calculation of the Briggian logarithm of the number 43,867, whose hyperbolic logarithm has been calculated above, we multiply it by 3, giving 131,601, and find by Mr. Gray's process that the factors of 1·31601 are

(1) 1·316	(5) $1 \cdot (001)^4 002$
(2) 1·000007	(6) $1 \cdot (001)^5 602$
(3) $1 \cdot (001)^2 598$	(7) $1 \cdot (001)^6 412$
(4) $1 \cdot (001)^3 780$	(8) $1 \cdot (001)^7 340$.

Taking the logarithms from Mr. Gray's tables we obtain the required logarithm by addition as follows:—

522	878	745	280	337	562	704	972 = colog 3
119	255	889	277	936	685	553	913 = log (1)
	3	040	050	733	157	610	239 = log (2)
		259	708	022	525	453	597 = log (3)
			338	749	695	752	424 = log (4)
					868	588	964 = log (5)
					261	445	278 = log (6)
						178	929 = log (7)
							148 = log (8)
4·642	137	934	655	780	757	288	464 = $\log_{10}$ 43,867

In Shortrede's *Tables* there are tables of logarithms and factors of the form $1 \pm (\cdot 1)^r n$ to 16 places and of the form $1 \pm (\cdot 1)^r n$ to 25 places; and in his *Tables de Logarithmes à 27 Décimales* (Paris, 1867) Fédor Thoman gives tables of logarithms of factors of the form $1 \pm \cdot 1^r n$. In the *Messenger of Mathematics*, vol. iii. pp. 66–92, 1873, Mr. Henry Wace gave a simple and clear account of both the logarithmic and antilogarithmic processes, with tables of both Briggian and hyperbolic logarithms of factors of the form $1 \pm \cdot 1^r n$ to 20 places.

Although the method is usually known by the names of Weddle and Hearn, it is really, in its essential features,

due to Briggs, who gave in the *Arithmetica logarithmica* of 1624 a table of the logarithms of $1+{}^{1}/_{r}n$ up to $r=9$ to 15 places of decimals. It was first formally proposed as an independent method, with great improvements, by Robert Flower in *The Radix, a new way of making logarithms*, which was published in 1771; and Leonelli, in his *Supplément logarithmique* (1802–3), already noticed, referred to Flower and reproduced some of his tables. A complete bibliography of this method has been given by Mr. A. J. Ellis in a paper "on the potential radix as a means of calculating logarithms," printed in the *Proceedings of the Royal Society*, vol. xxxi., 1881, pp. 401–407, and vol. xxxii., 1881, pp. 377–379. Reference should also be made to Hoppe's *Tafeln zur drcissigstelligen logarithmischen Rechnung* (Leipsic, 1876), which give in a somewhat modified form a table of the hyperbolic logarithm of $1+{}^{1}/_{r}n$.

The preceding methods are only appropriate for the calculation of isolated logarithms. If a complete table had to be reconstructed, or calculated to more places, it would undoubtedly be most convenient to employ the method of differences. A full account of this method as applied to the calculation of the *Tables du Cadastre* is given by M. Lefort in vol. iv. of the *Annales de l'Observatoire de Paris*.

(J. W. L. G.)

LOGIC.

1. LOGIC, in the most general acceptation of the term, may be regarded as the systematic study of thought. So wide a definition is certainly sufficient to comprehend all that may have been at various times included within the scope of logical doctrine, but in other respects it is of small value. It does not serve to mark off logic from philosophy as a whole, which is unquestionably the systematic exposition of thought, nor from psychology, which includes within its wider range what may well be described as the study of thought. Without some more accurate discrimination of the province and method of logic, neither the extent of matter to be included within the study nor the peculiarity of the method by which such matter is treated can be determined.

Preliminary queries of a similar kind are naturally encountered in the case of all other branches of human knowledge, and are generally answered by two methods. We may refer either to the distinct characteristics of the matter to be treated, or to the essential features of the method of treatment. We may determine the province of a science either by external division, by classification of objects according to their prevailing resemblances and differences, or by internal definition, by exposition of the fundamental characters of the method employed. By neither process, unfortuuately, can an unambiguous answer be supplied, at least without much art, in the case of logic.

2. The reasons for the manifold difficulties encountered in the attempt to determine accurately the province of logic, whether by reference to a division of the sciences or by precise definition of the essential features of logical analysis, are not far to seek. The systematic classification of the sciences involves not only consideration of the contents of the seiences as empirically presented, but also certain leading principles or fundamental views, which are in essence of a philosophical character. According to the general conception of knowledge which in various kinds is manifested in the special sciences, there will be radically divergent methods of classification, and the province assigned to each member of the ensemble will, for the most part, have its limits determined according to the character of the general view adopted. Moreover, if any of the more prominent specimens of classification of the sciences be critically inspected, they will be found to presuppose a certain body of principles, of scope wider than any of these special diseiplines, and to which no place in the ensemble ean be assigned. In short, a systematic distribution of human knowledge into its distinctly marked varieties rests upon and presupposes a general philosophy, the character of whieh affeets the place and funetion of each part of the distribution. Logic, as may readily be imagined, has therefore experienced a variety of treatment at the hands of systematizers of scientific knowledge. It has appeared as one of the abstract sciences, in opposition to those disciplines in whieh the character of the concrete material is the essential fact; as a subordinate branch of a particular concrete scienee, the investigation of mental phenomena; as a nondescript receptacle for the formulation in generalized fashion of the method and logical precepts exemplified in the special seiences. By such proeesses no more has been effeeted than to bring into light, more or less clearly, some of the characteristics of the supposed science, without in any way supplying an exhaustive and comprehensive survey of its boundaries and relations to other branches of knowledge. Thus, when logic is marked off from the concrete sciences and associated with mathematics in the most general sense, as the treatment of formal relations,[1] and further differentiated from mathematics as implying no reference to the quantitative character of the most general relations under which facts of experience present themselves,[2] there is certainly brought to the front what one would willingly allow to be a commonplace respecting all logical analysis, namely, that its principles are coextensive with human knowledge, and that all objects as matters of conscious experience have an aspect in which they are susceptible of logical treatment. But no more is effected. It is still left to a wider consideration to determine what the specific aspect of things may be which shall be called the *formal* and be recognized as the peculiarly logical element in them. There may be selected for this purpose either the general relations of coincidence and succession in space and time, or the fundamental properties of identity and difference, or the existences of classes, but in any case such selection depends upon and refers to a theory of the nature of knowledge and of the constitution of things as known. In truth, the notions of *form* and *formal relations* are by no means so simple and free from ambiguity that by their aid one can at once solve a complicated problem of philosophic arrangement. To lay stress upon *form* as the special object of logical treatment still leaves undecided the nature and ground of the principles which are to be employed in evolving a science of form, and therefore leaves the logieal problem untouched.

Still less satisfaetory are the results when logic is regarded as in some way a subordinate branch of the psychological analysis of mental phenomena.[3] Neither the grounds on which such a classification rests, nor the conclusions deduced from it, seem beyond criticism. The simple facts that certain mental processes are analyzed in logic, and that psychology is generally the treatment of all mental processes, by no means necessitate the view that logic is therefore the outgrowth from and a subordinate part of psychology. For it is clear, on the one hand, that logic has a scope wider than psychology, since in any sense of the term it has to deal with all the processes (or with some aspect of all the processes) by which on any subject knowledge is formed out of disjointed or disconnected experiences. And, on

[1] As, *e.g.*, by H. Spencer, *Classification of the Sciences*, pp. 6, 12; H. Grassmann, *Die Ausdehnungslehre von 1844* (1878), Einleitung, xxii.-xxiii.

[2] Logic and mathematics, under this view, may be regarded either as generically distinct—which is apparently the opinion of Spencer, H. Grassmann, and Jevons—or as species of a more comprehensive genus, the theory of formal (symbolic) operations—which is apparently the opinion of R. Grassmann (see his *Formenlehre*, 1872) and Boole (see his *Mathematical Analysis of Logic*, 1847, p. 4, and *Differential Equations*, 1859, chap. xvi., specially pp. 388, 389). An admirable treatment of that which is implied in Boole's method is given in Mr. Venn's *Symbolic Logic*, 1881.

[3] For this extremely common arrangement, see Hamilton, *Lectures on Metaphysics*, i. p. 121–3; Ueberweg, *System der Logik*, § 6.

the other hand, since the subordination of one science to another, as species to genus, is fallacious, unless the two agree in fundamental characteristics, the position so assigned to logic would imply that in aim and method it shall be essentially one with psychology, a position equivalent to the negation of logic as a separate and independent discipline. It is not surprising therefore to find that so soon as logic has been distinguished as arising from psychology, and so dependent on it, the peculiarity of its position and functions compels the recognition of its more general scope and the reduction of its connection with psychology to an amount small enough to be compatible with absolute independence. Strong reasons, indeed, may be advanced for holding that logic is entirely to be separated from psychology, as differing from it in aim, method, and principle, that logical analysis is generally distinct from psychological, and that the two disciplines, while connected as parts of the general body of philosophical reflection, hold to one another a relation the reverse of that commonly accepted.[1]

As to the endeavor to collect from consideration of the sciences in detail a body of precepts, the rules of scientific method, and to assign the systematic arrangement of such rules to one special discipline, called logic, it seems to stand on the same footing and to be open to the same criticism as the allied attempt to treat general philosophy as the receptacle for the most abstract propositions reached in scientific knowledge. There is a peculiar assumption underlying the supposed possibility of distinguishing between scientific method and its concrete exemplifications in the special sciences, and only on the ground of this assumption could there be rested the independence of logic as the systematic treatment of method. It is taken for granted, without examination, that the characteristic features of correct and well-founded thinking are palpable and general, and that we thus possess a criterion for marking off what is common to all scientific procedure from that which is special and peculiar to the individual sciences. An elaborate philosophic doctrine lies at the root of this assumption, and the position assigned to logic may easily be seen to depend, not on what is apparent in the argument, namely, comparison of the sciences with one another, but on what lies implicit in the background, the philosophic conception of the nature of scientific knowledge in general. Without reference to the ultimate philosophic view, no definite content could be assigned to logic, and it would remain impossible to distinguish logic from the sciences in detail.[2]

3. Thus the various attempts to define the province and functions of logic from general classification of the sciences, to define, in short, by the method of division, yield no satisfactory answer, and refer ultimately to the philosophic view on which classification and division must be based. A similar result becomes apparent when we consider the various descriptions of logic that have been presented as following from more precise and accurate determination of the essential features of logical analysis and method.

"The philosophical deduction or construction of the notion of logic presupposes a comprehensive and well-grounded view, whether of the nature and mode of operation of the human mind, a definite part of which falls under logical treatment, or of the problems and objects of philosophy in general, from among which in due order may be distinguished the particular problem of logic."[3] The most elementary distinctions, by means of which, in the ordinary exposition of logic, progress is effected towards an accurate determination of the province of the science, not only refer to some such ultimate philosophic view, but lead to the most diverse results, according to the peculiarity of the views on which they are based. Of these elementary distinctions the following are at once the more usual and the more important:—the distinction between the province of logic and the province of the special sciences, as that between general and special; the distinction between natural growth of knowledge, with its natural laws, and the normal procedure whereby grounded knowledge is obtained, with its normal or regulative principles; the distinction between knowledge as a whole and its several parts, immediate and mediate, with restriction of logic to the treatment of all or portion of mediate knowledge; the distinction between the constituents of knowledge as on the one hand given from without (in experience), and on the other hand due to the elaborative action of intellect itself. To one or other of these may be traced the common definitions of logic, and a brief consideration of their contents will be sufficient to show that they severally rest upon more or less developed general philosophic doctrines, and that their significance for accurate determination of the field of logic depends not so much on what is explicitly stated in them as on what is implied in the general doctrines from which they have taken their rise.

The distinction of logic from the sciences, as dealing in the abstract with that which is concretely exemplified in each of them, is certainly a first step in the process of determination about which there can be little or no doubt. But if the distinction remain vague, it is not sufficient to differentiate logic from many other disciplines, philosophical or philological, and if it be made more precise, the new characteristics will be found to involve some special view as to what constitutes the common feature in the sciences, and to vary with the possible varieties of view. As a rule, too, the added characteristics do not serve by themselves to mark off logical treatment as an independent kind of investigation. They are most frequently obtained by a general survey of scientific procedure. Thus it may be said that in all sciences there are implied clearly defined notions, general statements or judgments, and methodical proofs; logic therefore, as the theory of the general element in science, will appear as the treatment of notions, judgments, and proofs generally, or in the abstract. If so, then, unless some implied principle further determine the course of procedure, logic would be regarded as a merely descriptive account of the parts making up scientific knowledge, and it would be not only impossible to assign to it an independent position, but hard to discriminate it from psychology, which likewise deals with the parts of knowledge. If it be understood, however, or explicitly stated, that in all scientific knowledge there is community of method, resting on common principles or laws of knowledge as such, then clearly not only the province of logic, as now made identical with the treatment of the essence of knowledge, but the special nature of the theorems making up the body of logic, must depend upon the general conception of knowledge with which the thinker starts. In the view of logic taken, *e. g.*, by Mill, the fundamental idea is that of *evidence*, under which must be included all the grounds for any judgment not resting on immediate perception. So far as verbal statement is concerned, the adoption of this as the root idea would not distinguish in any special way the treatment of logical problems resting on it, but in fact each problem is dealt with in accordance with the particular theory of what, from the nature of human knowledge, constitutes evidence. Logic thus involves, or in truth becomes, a theory of knowledge, and in the end, for general spirit and details of doctrine, refers to an ultimate philosophic view. There seems no escape from this conclusion. Start as we may, with popular, current distinctions, no sooner do logical problems present themselves than it becomes apparent that, for adequate treatment of them, reference to the principles of ulti-

[1] It is to be acknowledged that most of the writers on logic who emphasize the connection of psychology with logic introduce distinctions equivalent to the remarks above made, but the grounds for such distinctions and the conclusions to be deduced from them are not generally brought into clear light.

[2] See, for a clear statement of this impossibility, Comte, *Philos. Positive*, i. 34, 35. Definitions of logic as theory of method, which are based on general philosophic views (*e. g.*, the definition by Sigwart, *Logik*, i. § 1), stand on a different footing, and are to be examined on different principles.

[3] Twesten, *Die Logik, insbesondere die Analytik* (1825), p. 2.

mate philosophy is requisite, and logic, as the systematic handling of such problems, ceases to be an independent discipline, and becomes a subordinate special branch of general philosophy.

The attempt to avoid this conclusion must of necessity take form in some discrimination of logic from other varieties which may with it be classed under philosophy in general, and such discrimination is usually effected by laying stress on one or other of the following characteristics.

(1) In the whole process of knowledge, it may be said, we are able to distinguish and to regard in isolation the methods according to which, from a combination of various elements, cognition of things grows up, and the laws according to which these elements must be ordered, if our subjective consciousness is to represent accurately and faithfully the relations of things. The laws of knowledge, there being understood by knowledge the whole sum of mental determinations in and through which the world of external and internal experience is realized for us, are of two distinct kinds, natural and normal. For the treatment of the natural laws the most appropriate title is psychology; for that of the normal or regulative laws the title logic is peculiarly appropriate. By the one science knowledge is regarded in its relation to the subjective consciousness, as so much of what enters into and constitutes the world of inner experience; by the other knowledge is regarded in its relation to truth, to the objective system, as the means whereby, for theoretical or practical purposes, an orderly and verifiable conception of this system is realized. A definite place seems thus secured for logic, but, if one may judge merely from the various attempts to expound the body of logical doctrines from this point of view, the characteristic feature is not yet sufficient to determine the boundaries of the science or the specific nature of its problems. In fact, the feature selected might be accepted as the distinguishing mark of logical science by writers who would include under that common title the most diverse matters, and who would differ fundamentally in respect to the treatment of isolated problems. The metaphysical logic of Hegel, the empirical logic of Mill, the formal logic of Kant, might all claim to be developments of this one view of the essence of logic. So wide a divergence is clear evidence that the criterion selected, though possibly accurate, is not sufficiently specific, and that the interpretation of it, which in truth determines for each the nature and boundaries of the science, depends upon the view taken respecting knowledge as a whole in its relation to the objective order of experience, respecting the import of the so-called normal laws, and respecting the subjective elements supposed to constitute knowledge.

On all sides this particular definition of logic is beset with difficulties, which it cannot afford to dismiss by means of the simple demand that knowledge shall be accepted as somehow given. For, apart altogether from the danger that under so wide a term as knowledge many differences may be accommodated, it then becomes impossible to do more than treat in a quasi-empirical fashion mental facts, the nature and peculiarities of which are to be learned from some external source. In the later, more detailed examination of the view of logic here briefly described, it will be pointed out that the usual formula by which the several logical notions are introduced, viz., that their nature as mental facts is dealt with in psychology, from which logic borrows, is in fact much more than a formula. The logical peculiarities will be found to rest mainly upon the psychological characteristics as borrowed, while it is evident that no substantive, independent existence can be vindicated for a doctrine the succession of whose parts and their essential nature are given externally.

(2) Some of the perplexities that arise when logic is treated as the theory of the normal laws of knowledge may be obviated by the current distinction between immediate and mediate knowledge. The normal laws of knowledge might be said to apply solely to the process of mediate cognition, and their final aim would be defined as harmony between mediate knowledge and immediate experience. But it is difficult to distinguish with perfect accuracy between the two kinds of knowledge in question; it is impossible that the treatment of the logical problem should not depend entirely on the view taken as to the nature of that which differentiates mediate from immediate knowledge. Whether we express this as thought or as belief, its nature then becomes the all-important factor in determining the course of logical treatment, and further progress will manifest divergencies according as stress is laid on the subjective characteristics of thought, the laws to which, from its essential nature, all its products must conform, or on the limitations imposed by principles which have reference to the most general relations of the things thought about. In the one case a formal logic, of the type commonly known as the Kantian, would be developed, in the other either an empirical logic, like that of Mill, wherein the nature of notions, propositions, and reasonings is considered from the point of view of the empirical conception of experience, or a transcendental logic, like that involved in the *Critique of Pure Reason*, or a metaphysical logic, like that of Hegel, or a mixed doctrine, like that of Trendelenburg, Lotze, and Ueberweg. In short, the general philosophic view of thought is that upon which the character of logic as a science rests.

(3) There has above appeared, incidentally, one of the most current methods of solving the logical problem, by procedure from the distinction between that which is given to the mind in knowledge, and that which is supplied by the mind itself. No distinction seems more simple; none is in reality more complex. The opposition on which, in its popular acceptation, it rests is that between the individual concrete thinking subject and the world of objective facts, existing, as it were, to be cognized. The full significance of such an opposition, the forms in which it presents itself in conscious experience, the qualifications which must be introduced into the statement of it that it may have even a semblance of reality,—these are problems not solved by a simple reference to the distinction as existing. It may well be held that knowledge is, for the individual, the mode (or one of the modes) in which his relation to the universe of fact is subjectively seized, but it is not therefore rendered possible to effect an accurate and mechanical separation of knowledge into its matter and form. Even on lower grounds it may be held that by the employment of this criterion little or no light is thrown upon the logical question. For no determination is supplied by it of the universal characteristic of form as opposed to matter in knowledge, and a comparison of various expositions will show the most startling diversity of view respecting the nature and boundaries of the formal element in knowledge. It is of course true that in one sense any scientific treatment of knowledge is formal. Our analysis extends only to the general or abstract aspect of cognition, not to its actual details. But we are not, on that account, dealing with the form of knowledge. So soon as it is attempted to define more accurately what shall be understood by form then it is found that various views of logic arise, corresponding to the variety of principles supposed to be applied in the treatment of form. Thus the stricter followers of the Kantian logical idea, *e. g.*, Mansel and Spalding, recognize, as sole principles which can be said to be involved universally in the action of thought, the laws of identity, non-contradiction, and excluded middle, and in their hands logic becomes merely the systematic statement of these laws, and the exposition of the conditions which they impose upon notions, judgments, and reasonings. Analytical consistency, *i. e.*, absence of contradiction, is on this view the one aspect of knowledge which is susceptible of logical treatment. On the other hand, the idea of a contribution furnished by the mind itself to knowledge may lead to a more concrete and yet not less exact system of the forms of knowledge, if there be taken into account the real character of the

operation by which such contribution is made. Thus in the logic of Ulrici, from the view of thought as essentially the distinguishing faculty, by which definiteness is given to the elements entering into knowledge, there follows not simply an iteration of the principle that thought must not contradict itself, but a systematic evolution of the fundamental relations involved in the action of thought, in which the more specifically logical products, the notion, judgment, and reasoning, have a determinate place assigned to them.

Not only, then, may quite distinct provinces be assigned to logic by thinkers who start with the same idea of thought as contributing to knowledge, but, as may well be imagined, the treatment of special logical problems presents a most bewildering variety. The nature of judgment, the principle of reasoning, the characteristics of thought which is in accordance with logical rule, will be viewed differently according to the special interpretation put upon the functions of the subjective factor in knowledge. Here again we find that the really influential fact in the determination of the province and method of logical science is a general philosophic conception of knowledge or thought.[1]

4. There remains yet one method by which a clear and sufficient definition of the province and function of logic may be attainable. It may be that the separation of logic from other philosophic disciplines has come about historically, and that the assignment to logic of a special body of problems and a special kind of treatment is due to the accidents of its development. We might therefore hope to gain from a comparative survey of the field of logic, as that has been historically marked out, some definite view not only respecting the specific problems of logical theory, but also regarding the grounds for the isolated treatment of them. That in the history of logic there should be found a certain continuity of doctrine and development may, however, be compatible with entire absence of a common body of received logical matter, and the result of an historical research may be little more than a statement of distinct conceptions regarding the nature and province of the science, leading to the inclusion of very distinct materials within its scope. It requires but a superficial investigation of that which at various intervals has presented itself as logical theory to arrive at the conclusion that the differences in general spirit and in the mass of details far outbalance any agreement as to a few detached doctrines and technical symbols. If the survey were limited even to the period preceding the attempts at radical reformation of philosophy in general, and of logic as included therein, to the period in which the Aristotelian doctrines, as they may be called, formed the common basis of logical treatment, we should be able to detect differences of such a kind as to indicate radically distinct fundamental views. The scholastic logic, which, even by itself, cannot be regarded as one theory with unimportant modifications, is most falsely described as Aristotelian. The technical terminology, the general idea and plan, and some of the formal details are certainly due to the Aristotelian analysis of reasoned knowledge, but in spirit, in ruling principles, and in the mass of details the method of the scholastic logic is alien to that of Aristotle. It will be shown later that the Aristotelian analysis is saturated with the notions and aims of the Aristotelian metaphysics and general theory of knowledge, and that on this account alone, apart from the introduction of many foreign ingredients, from Stoic, Arab, and Byzantine sources, into the scholastic system, an important difference must subsist between the original doctrine and that which presents itself as but its historical development. Even more radical is the divergence of modern logic from the Aristotelian ideal and method. The thinker who claimed for logic a special pre-eminence among sciences because "since Aristotle it has not had to retrace a single step, . . . and to the present day has not been able to make one step in advance,"[2] has himself, in his general modification of all philosophy, placed logic on so new a basis that the only point of connection retained by it in his system with the Aristotelian may be not unfairly described as the community of subject. Both deal in some way with the principles and methods of human thinking, but as their general views of the constitution of thought are diverse, little agreement is to be found in the special treatment of its logical aspect. So when a later writer prefaces his examination of logical principles with the declaration that "logic is common ground on which the partisans of Hartley and of Reid, of Locke and of Kant, may meet and join hands,"[3] we are not unprepared for the result that, with a few unimportant exceptions, his views of logical principle coincide with those of no recognized predecessor in the same field, diverge widely from either the currently received or the genuine Aristotelian doctrines, and lead to a totally new distribution, in mass and detail, of the body of logical theorems and discussions. Such divergence is, indeed, most intelligible. If one reflects on the significance which would be attached in any one of these logical systems, of Aristotle, of Kant, of Mill, to the *universal* or universalizing element of thought, and on the fact that such universal must manifest itself as the characteristic feature in all the important products of thinking, the notion, the judgment, the syllogism, the conclusion is inevitable that difference of view in respect to the essence must make itself felt in difference of treatment of details. The ultimate aim of proof, and the general nature of the methods of proof, must appear differently according as the accepted ground is the Aristotelian conception of nature and thought, the Kantian theory of cognition, or subjective empiricism.

If, adopting a simpler method, one were to inspect a fair proportion of the more extensive recent works on logic, the conclusion drawn would be probably the same,—that, while the matters treated show a slight similarity, no more than would naturally result from the fact that thought is the subject analyzed, the diversity in mode of treatment is so great that it would be impossible to select by comparison and criticism a certain body of theorems and methods, and assign to them the title of logic. That such works as those of Trendelenburg, Ueberweg, Ulrici, Lotze, Sigwart, Wundt, Bergmann, Schuppe, De Morgan, Boole, Jevons, and these are but a selection from the most recent, treat of notions, judgments, and methods of reasoning, gives to them indeed a certain common character; but what other feature do they possess in common? In tone, in method, in aim, in fundamental principles, in extent of field, they diverge so widely as to appear, not so many different expositions of the same science, but so many different sciences. In short, looking to the chaotic state of logical text-books at the present time, one would be inclined to say that there does not exist anywhere a recognized, currently received body of speculations to which the title logic can be unambiguously assigned, and that we must therefore resign the hope of attaining by any empirical consideration of the received doctrine a precise determination of the nature and limits of logical theory.

5. In order to make clear the reasons for this astonishing diversity of opinion regarding the province and method of logic, and so make some advance towards a solution of what may well be called the logical problem, it seems necessary to consider some of the leading conceptions of logic, with such reference to details as will suffice to show how difference of fundamental view determines the treatment of special logical problems. In this consideration the order must be historical rather than systematic. Not, indeed, that it is needful, nor

[1] In Rosenkranz, *Die Modificationen der Logik abgeleitet aus dem Begriff des Denkens* (1846), a similar conclusion is illustrated by an elaborate classification of possible modifications of the view of logic. Compare also Braniss, *Die Logik in ihrem Verhältniss zur Philosophie geschichtlich betrachtet* (1823).

[3] Mill, *System of Logic*, i. p. 13.

is it proposed, to present an historical account of philosophy at large, or even of logic in particular; our purpose is merely to disentangle and bring clearly forward the nature of the principles respecting logical theory which have served as basis for the most characteristic logical systems. Such an inquiry will not only assist in explaining the divergencies of logical systems, but throw light upon the essence of logic itself.[1]

In this historico-critical survey, the first section must naturally be devoted to a consideration of the Aristotelian logic. The records of Oriental attempts at analysis of the procedure of thought may, for our present purpose, be disregarded.[2]

The Aristotelian Logic.

6. In a remarkable passage at the close of the tract called by us the *Sophistical Refutations*, Aristotle claims for himself distinct originality in the conception of subjecting to analysis the forms or types of argument. "The system I have expounded had not been partially, though imperfectly, elaborated by others; its very foundations had to be laid. . . . The teachers of rhetoric inherited many principles that had long been ascertained; dialectic had absolutely no traditional doctrines. Our researches were long, tentative, and troublesome. If, then, starting from nothing, it bears a comparison with others that have been developed by division of labor in successive generations, candid criticism will be readier to commend it for the degree of completeness to which it has attained than to find fault with it for falling short of perfection."[3] Although the specific reference in this passage is to the analysis of dialectical argument contained in the *Topica*, the same claim might with justice have been made in regard to the more extensive analysis of the forms of reasoning in general which makes up the substance of the other books of the *Organon*. There had been, prior to Aristotle, much discussion of problems that would under any view be included under the head of logic, but no systematic attempt had been made to analyze knowledge as a whole in its formal aspect, to throw under general heads or classes the types of reasoning, whether dialectical or scientific, and to exhibit the general relations in which the elements of all reasoning stand to one another. After Aristotle, it became possible to refer all such discussions to a common head, and to view them as component parts of one systematic doctrine. In a peculiar sense, then, Aristotle may be described as the founder of logical science.

The precise nature of the inquiries falling within the scope of the Aristotelian logic may receive some preliminary explanation supplementary to that which can only be given by a careful study of the chief theorems of the system, if there be taken into account (*a*) the advances towards a theory of logical method contained in the speculations of earlier Greek thinkers, (*b*) the classification of philosophic discipline which underlies the body of Aristotle's writings, and (*c*) the general conception of the matter of logical analysis which may be deduced from any special or incidental treatment of the question in Aristotle. Of these in order.

7. (*a*) Logical discussions prior to Aristotle.

The inquiries which find a place in the Aristotelian logic are all, in a large sense, problems of the theory of knowledge. They arise, therefore, only in connection with critical reflection on the nature, grounds, and method of knowledge. The earliest forms of Greek speculation, turning rather upon explanation of natural fact, being in essence attempts to reduce the multiplicity of known fact to unity of principle, contain, as a consequence, problems of a metaphysical character, which might involve problems of strictly logical character, but were logical only in potentiality. Of all these metaphysical questions the most important centre round the fundamental opposition between unity of principle and multiplicity of fact, between the one and the many, an opposition which under varied forms presents itself at every stage in the history of philosophic speculation. In the first period of Greek speculation, the problem presented itself in its simplest, most direct aspect, and, after a few rough attempts at a quasi-physical explanation of the genesis of many out of one, there come forward, as reasoned, ultimate solutions, the Eleatic doctrine that only unity has real being, the Heraclitic counter-doctrine that only in change, in the many, is truth to be found, and the Pythagorean notion of number, harmony, as containing *in abstracto* the union of the opposites, one and many. No one of these philosophic treatments can be said to contain specifically logical elements, but they raise questions of a logical kind, and, especially in the records of the Eleatic views, one can trace a close approximation to the critical reflection which marks the transition to a new order of ideas. Results which in these systems are stated with metaphysical reference only, reappear with new aspect among the sophists and the Socratic schools. The transition stage, indeed, partly aided by the atomic separation of objective fact from subjective sense experience, is mainly the effect of the sophistic and Socratic teaching. Socrates and the sophists have this in common that both treat the fundamental problem of philosophy as it had been handed down with special reference to the subjective experience of the individual. In the teaching of the sophists generally is to be discerned the opposition between subjective reflection and objective fact; in that of Protagoras and Gorgias in particular there appear as problems of the theory of knowledge difficulties for the older metaphysic of Heraclitus and the Eleatics respectively. The Heraclitic principle of change is the general foundation for the doctrine that the momentary perception is the only fact of cognition, and upon it may be based the conclusions that all truth is relative to the individual state of the individual subject, and that judgment, as a mode of expressing truth, is a contradiction in itself. Thus the extreme Heracliteans, as Cratylus, rejected the proposition, or combination of words, as expressing a unity and permanence not to be found in things, and reduced speech to the symbolism of pointing with the finger. Less developed but not less clear is the connection between the brief sceptical theses of Gorgias and the Eleatic doctrine of unity. As knowledge was impossible on the Heraclitean view, since it implied a synthesis not discoverable amidst incessant change, so for Gorgias knowledge was impossible, since in the synthesis was involved an element of difference, multiplicity, not reconcilable with the all-embracing unity of things. It is evident from the treatment of such views in Plato and in Aristotle, how many of the illustrations used in support of the general thesis depended for their apparent strength on neglect of some of the elementary conditions of thought, and how inevitably reflection upon these difficulties led to the construction of a theory of thought. The first outlines of such a theory are to be found in the Socratic principle of the notion (or concept, as we may call it, for the notion as viewed by Socrates is certainly the concrete class notion, the simple result of generalization and abstraction), and to Socrates is assigned by Aristotle the first statement of two important logical processes—induction, or the collection of particulars from which by critical comparison a generalized result might be drawn, and definition, or the explicit statement of the general elements disclosed by critical comparison of instances.[4] In the Socratic teaching, so far as records go, no explicit reference was made to the problems in connection with which those processes are of greatest significance, but in the lesser Socratic schools on the one hand, and in Plato on the other, we find the new principle either brought to hear upon the old difficulties, or developed into a comprehensive method.

The Socratic concept contains in itself the union of one and many, but it is in nature subjective; it is a mode of knowledge. If, then, it be regarded as only subjective, the old difficulties reappear. How is it possible to reconcile, even in thought, an opposition so fundamental as that between unity and plurality? Must there not be a like irreconcilable opposition between the subjective counterparts of these objective relations, between the individual notion, the atom of knowledge, and the proposition or definition? How, indeed, can there be a combination in thought of that which is in essence uncombinable? Whether we take Aristippus, who draws mainly for theory of knowledge on the Heraclitic-Protagorean sources, or Antisthenes, who leans towards the Eleatic, or the Megarics, who also, in accordance with the Eleatic thoughts, devoted chief attention to the polemical aspect of the theory, we find a set of problems appearing, the solution of which imperatively called for a theory of knowledge as the combination of one and many. Perhaps the most interesting of these early thinkers, so far as the history of logic is concerned, is Antisthenes, whose extreme nominalism presents the most curious analogies to some recent logical work.[5] According to Antisthenes, the world of cognizable fact consists of combinations of elementary parts (πρῶτα). These πρῶτα appear in cognition as irreducible elements denoted by the simplest elements of

[4] *Metaph.*, 1078b, 27–29.

[5] On Antisthenes, see the third part of the *Thæætetus*, which appears, beyond doubt, to refer to him (comp. Peipers, *Untersuchungen über das System Plato's*, 1874, pp. 124–48), and Aristotle, *Metaphysics*, 1024b, 32; 1043b, 24; *Topica*, 104b, 21.

speech, names. The name is the mark for the sense-impression by which each πρῶτον is communicated to us, for they are only known by sense, and are strictly individual. A composite thing is known through the combination of names of its parts, and such a combination (συμπλοκή) is a proposition or definition (λόγος). Each thing has its specific λόγος (οἰκεῖος λόγος), and a judgment is merely the expression of this. There is therefore no distinction of subject and predicate possible; even identical propositions, the only possible forms under this theory, are mere repetitions of the complex name. Predication is either impossible or reduces itself to naming in the predicate what is named in the subject. It is the simple result of so consistent a nominalism that all truth is arbitrary or relative; there is no possibility of contradiction, not even of one's self.

The theory of Antisthenes, strange as it may at first sight appear, rested on certain metaphysical difficulties, which lie at the root of all the perplexity regarding the import of propositions, and it is not too much to say that these difficulties were kept continually in mind by Plato and Aristotle in their several attempts to explain the nature of knowledge. Both thinkers find themselves confronted with the ultimate question, What is the ground of unity in things known, and in what way does thought unite the detached attributes of things into a subjective whole? What is the nature of the unity which binds things, themselves in a sense units, into classes or wholes, and how comes it that in the judgment subject and predicate are, in a sense, set at one?

In Plato, for whom the solution was found in the participation in or imitation of ideas by things, we find more distinctly conceived the series of logical processes involved obscurely in the Socratic method. So far as positive statements regarding the ideas can carry one, it may be said that in essence these processes concern only the formation of or deduction from the concrete universal concept or general notion. The ideas, in the Platonic system, at least in reference to the thought which apprehends them, resemble most closely class notions. A deeper significance often appears to attach to the relative processes of *induction*, whereby the resemblances of things, the idea in them, is disclosed, *definition*, whereby the content of the idea is made explicit, and *division*, whereby the external connection of ideas with one another, their system, is deduced, but such significance attaches to the more purely metaphysical aspects of the theory, and had no particular bearing on the Aristotelian treatment of the same problems. Not much is given in Plato towards a theory of the proposition, though sometimes an analysis of its elements is sketched; and the method of division could yield only a few of the types of deductive reasoning. But, over and above these more definite contributions towards the construction of a theory of knowledge, there are general aspects of the Platonic work of not secondary importance for the Aristotelian logic. In Plato the fundamental differences of earlier philosophic views appear in a new phase, and are elevated to a higher stage. Sophistic method is analyzed, not as in forms actually existing, but in its essential features, and the opposition between sophist and philosopher is viewed as the opposition between opinion and knowledge. Heraclitic principle of change and Eleatic doctrine of unity are resolved into the more comprehensive opposition of the universal and the particular, while hints of an ultimate solution, of a universal which is at once and *per se* particular, are not wanting. The Socratic method of thought appears as that by which alone a solution of philosophic difficulties is to be obtained, and the consideration of thought in its relation to facts is marked out for special investigation. A deeper view of thought was thus made at once possible and necessary.

8. (*b*) Much, then, had been effected by Aristotle's predecessors in the way of preparing a definite body of problems and a method of dealing with them, problems and method which might fairly be said to belong to a theory of knowledge as such, and from the occasional references in the *Organon* to opinions of contemporaries it is evident that many isolated attempts at solution of such questions were being carried on. In Aristotle we find a systematic examination of many of these problems, but it is left by him doubtful what place in the general scheme of philosophic sciences should be assigned to it. The distribution into physics, mathematics, and first philosophy, or the wider classification of doctrines as poetic, practical, or theoretical, in no way enables us to class logic or the body of speculation making up the *Organon*. That the forms of proof analyzed in these writings are of universal scope is unambiguously declared; that the first principles assumed in all proof are dealt with in first philosophy is also made clear; but the relations between the two doctrines so reciprocally related cannot be determined from any statement made by Aristotle himself. That he should have regarded the inquiries of the analytics as propædeutic in character, and should have held that those who assume to discuss problems of first philosophy ought to have made themselves acquainted with the general theory of proof, is intelligible, and more than this significance cannot, we think, be assigned to the passage in the *Metaphysics*, on the ground of which the logical inquiries have been classed as the general, common introduction to the whole system.[1] For the close connection between the analytical researches of the *Organon* and the inquiry into essence or being as such forbids us to accept, in any strict sense, a separation of these as forming distinct and independent sciences. To metaphysics is assigned the consideration of the principles of proof, and the kind of inquiry making up first philosophy is described by Aristotle in a fashion which assimilates it most closely to the researches of the analytics. That which is left undecided by the Aristotelian classification is the relation of the logical inquiries to the organic whole of which first philosophy is the main or sole part.[2] To obtain any fresh light we must turn to the consideration of indications supplied by Aristotle as to the nature of the inquiries grouped under the head *Analytics*.

9. (*c*) Such indications are unfortunately most scanty. As we probably have not the *Metaphysics* in its full extent, actual or contemplated, the want of a clear separation between the inquiries belonging especially to first philosophy and those appropriate to the analytical researches may be due in part to the deficiency of our materials. There are, however, two lines of separation discernible, from which some useful inferences may be drawn. What we call the logic of Aristotle, *i. e.*, the treatises making up the *Organon*, is roughly divisible into three parts:—(1) the formal analysis of syllogism and its allied types of reasoning, with the more particular discussion of the elementary parts of reasoning=the proposition; (2) the theory of scientific proof and definition (apodictic); (3) the theory of probable arguments, or of reasoning based on current received opinions and leading to conclusions more or less probable (dialectic). Certainly for Aristotle there was no such distinction between the first and the remaining two parts as would in any way correspond to the modern separation of general or formal logic from the theory of knowledge, or material logic; the three parts in conjunction make up one body of doctrine. Now dialectic is very specially indicated as being of a formal character, *i. e.*, as dealing with no special matter, but with κοιναί, opinions, or types of opinions, common to all sciences.[3] Apodictic, we may assume, is in like manner the formal study of what constitutes knowledge strictly so-called, the nature of the principles on which knowledge rests, the special marks distinguishing it, and the method by which knowledge is framed. But in every body of doctrine we may distinguish, according to Aristotle, three things,—the genus or class of objects with which the demonstration is concerned, the essential or fundamental attributes, qualities of these objects, which are to be demonstrated of them, and, thirdly, certain common axioms or principles of demonstration, not themselves demonstrable, and not entering as integral parts into the demonstration, but lying in the background as security for the reasoning carried out by thought employing them. Can anything corresponding to these three facts be discovered, if we assume for the moment, what certainly is not explicitly stated by Aristotle, that analytic constitutes a special body of doctrine? The genus or class about which the doctrine is concerned can only be reasoning itself, either as apodictic or dialectic, and the latter for a special reason may be left out of account; ἀπόδειξις, then, is the matter concerning which the doctrine is put forward. But ἀπόδειξις is a form of knowledge, that is to say, subjective. The properties, therefore, of apodictic science can only be made clear if we consider on the one hand the objective counterparts of necessity and universality in thought, and on the other hand the nature of universality and necessity of thought itself. The common principles or axioms, finally, can only be such presuppositions as are made in apodictic or reasoning generally respecting thought in its relation to fact, as grasping or apprehending reality. The consideration of such axioms, it has been already seen, pertains to first philosophy. Analytics then would appear as an independent doctrine, holding of first philosophy on the one

[1] *Metaph.*, iv. 1005b, 2. See Zeller, *Ph. d. Gr.*, ii. 2 (3d ed.), p. 184, *n.*; Rassow, *De Definit. Not.*, 46, 47,; Schwegler, *Comment. zur Metaph.*, iii. 161; and *contra*, Prantl, *Gesch. der Logik*, i 137. Zeller maintains the view that Aristotle intends to indicate the place occupied by the analytics in his general scheme of philosophy.

[2] On Aristotle's use of the term λογικός and its allies, see (in addition to Waitz, *Com. in Organ.*, ii. p. 353–55) Schwegler, *Commentar zu Ar. Metaph.*, vol. iv. p. 48–51.

[3] See *Anal. Post.*, i. 11; *Rhet.*, i. 1, and in many passages. *Cf* Heyder, *Method. d. Arist.*, p. 348.

hand, both in regard of the common axioms and in regard of the attributes of being, by which it is a possible object of science, and on the other hand referring to the subjective treatment of thought, whether in relation to principles or to fact generally.

A very similar result may be obtained if we follow out a line of distinction indicated in more than one portion of the *Metaphysics*.[1] Separating the modes in which being is spoken of into four—(1) τὸ ὂν κατὰ συμβεβηκός; (2) τὸ ὂν ὡς ἀληθὲς καὶ τὸ μὴ ὂν ὡς τὸ ψεῦδος; (3) τὸ ὂν κατὰ τὰ σχήματα τῆς κατηγορίας; (4) τὸ ὂν δυνάμει καὶ ἐνεργείᾳ—Aristotle excludes the second from the special researches peculiar to first philosophy, the study of being as being, but neither excludes it from general consideration in metaphysics as a whole, nor handles it at length, deferring it rather for more detailed treatment. A comparatively clear account, however, of what is understood by him under the head of being as truth and non-being as falsity may be extracted from the various passages referred to, and little doubt can remain that being so regarded is in a peculiar sense the matter of analytical (*i. e.*, logical) researches.

Being as truth and non-being as falsity refer to and rest upon combination and division of the elementary parts of thought. For truth and falsity have no significance when applied to things, but only to the connection of thought which is dominated by the one principle of non-contradiction. Nay, thinking has not even immediate and direct reference to being as such, but only to being as the existent, as qualified, or quantified, or modified in some other way (*i. e.*, according to the categories), and it is in its very essence the conjunction or unifying of elements. What cannot be conjoined, as, *e. g.*, the notions of elementary facts themselves, are not either true or false, and are not matters of thought. Thought thus moves in a definite sphere, that of the combinable or separable, the correspondence of conceptions with real relations, and has its limits on the one hand in the elementary data apprehended by intellect (νοῦς=reason), and on the other hand in the infinite sea of particular, accidental qualifications of things (συμβεβηκότα). The possibility of contradictory assertions (for true and false judgments together make up the contradiction, τὸ δὲ σύνολον περὶ μερισμὸν ἀντιφάσεως) is the distinguishing mark of thought. Now it is this very possibility that lies at the root of all the analytical researches. Not, indeed, that one can assume for Aristotle a view which has appeared in later logical works, that all forms of logical reasoning are to be deduced from the principle of contradiction. Quite the reverse. The common axioms underlie all processes of proof, direct or indirect, but they do not enter into or form part of proof. Nothing can be deduced from them; but their authority can be appealed to against any one who refuses to allow a conclusion reached by a correct syllogism from true premises.[2] (The nerve of logical proof would thus lie in the disjunctive proposition; either this conclusion is to be granted or the principle of contradiction is denied.) Now the analytical researches are in especial the treatment of combination and separation in thought. For even the syllogism may be regarded as only a complex judgment or synthesis, and in the exposition of the forms of combination and separation we shall find a complete system extending from the unproved principles and exhibiting the methods according to which thought proceeds towards the determination of the essential properties of things or the discrimination of various heads under which the transitory and accidental attributes may be advantageously classed.

So far then as one can judge, the matter of Aristotle's analytical researches may be expressed as the concrete nature of thought, characterized by its fundamental attribute, the possibility of contradiction, correlated with the real system of things, and having as its end the realization of systematic knowledge, *i. e.*, the adequate subjective interpretation of being.

10. The indication that the analytics have to do with being as conceived by thought, conducted under the general axiom of non-contradiction and expressed in language, requires to be filled up by a more detailed treatment of the Aristotelian theory of thought in relation to being. Upon the characteristics assigned to thought or knowledge in this special relation, must depend the general nature of the Aristotelian logic, the determination of the scope of logical treatment, and the essence of logical method. For from a quite similar statement regarding the province within which logic moves totally diverse conclusions might be drawn respecting the precise function of logical method. One might have either a formal doctrine or *technic*, or a real methodology, either an attempt to evolve logical principles from the axiom of contradiction, or a development of the laws according to which thought, necessarily acting under the said axiom, proceeds towards the construction of knowledge. The history of logic clearly shows how differently the matter of the analytics may be viewed. For one of the possible conclusions, that logic is a technic or quasi-mathematical exposition of formal relations, has been accepted as the undoubted result of Aristotle's teaching, and has so prevailed as to make itself the current conception.[3] The other, the view of logic as theory of the method of scientific thought, has been cast entirely into the background, so far as logical doctrines are concerned, and, if allowed at all, has been regarded as foundation for a species of applied logic, an appendix to the other.

11. Not much aid is afforded directly by any classification or division of the books now collected together as the *Organon*. As above noted, the *Prior* and *Posterior Analytics* with the *Topics* form one connected whole, while the *Categories* and the *De Enunciatione* stand apart as isolated treatments of special problems, not organically or necessarily part of the research. The genuineness of both these treatises has been doubted (see ARISTOTLE, vol. ii. p. 452), and it is not improbable that both are redactions of Aristotelian material, perhaps drawing from other lost writings of Aristotle, perhaps based on oral teaching, by some Aristotelian scholar. A summary view of the contents of the other books will be found at vol. ii. p. 453.

12. The logical researches as a whole manifest a strong unity, and at the same time refer to one fundamental opposition, that between *apodictic* and *dialectic* reasoning.[4]

The opposition between apodictic and dialectic is in the Aristotelian system the development of that which had already played so important a part in Plato and Socrates, the distinction between science and opinion. Knowledge in the strict sense had there presented itself as the generalized notion referring to being in its very essence, and resting on thought or reason. Opinion is the quasi-knowledge of the particular, referring to that which is not being but only accident, and resting on sense or imagination. In the Platonic method this distinction had come forward as the underlying basis for the opposition of philosophy and sophistical rhetoric; in Aristotle a much more precise formulation is given of the characteristics of the two opposed forms of thought, and the connection between opinion or dialectic and rhetorico-sophistical discussion is made more concrete and profound. Dialectic, with Aristotle, is the system resulting from the attempt to reduce to rule or generalize modes of argument which rest upon current received doctrines as principles, which move within the region of interests about which current opinions *pro* and *con* are to be found, and which terminate not in the decisive solution of a problem but in clearing the way for a more profound research, or at least in the establishment of the thesis as against an opponent. Dialectic, then, has no special province; it deals with κοινά or ἔνδοξα, and its methods are perfectly general. On the one hand, as being the application of reasoning, it refers to and employs the specific types of reasoning, syllogism and induction; on the other hand, as being applied to matters of opinion, and borrowing its principles from current floating dicta about matters of common interest, the types of reasoning tend in it to assume special forms resembling those employed in rhetoric (which is a kind of offshoot from dialectic—the application of dialectic to political principles). The province of dialectic being thus essentially vague, the matters about which dialectic reasoning is concerned being of the most fluctuating character, there must be, for Aristotle, the greatest difficulty in determining, *per se* and apart from the opposition to apodictic, what is the character of dialectic syllogism and induction. Nor can it be said that the interpreter of Aristotle has an easy task in the endeavor to discover what precisely is dialectical reasoning and in what way the forms which are assumed to be common both to apodictic and dialectic come to have any application to the fluctuating mass of current opinions. It is comparatively simple to say apodictic and dialectic

[1] *Metaph.*, vi. 4, v. 29, ix. 10. *Cf.* Schwegler, *Com.*, iii. 241, iv. 29 *sq.*, 186; and Brentano, *Bedeutung des Seienden nach Arist.*, 21 *sq.*

[2] *Cf.* generally *Anal. Post.*, i. 14.

[3] *Cf.* Brandis, *Gr.-röm. Phil.*, ii. 373–75.

[4] The most important treatments of the principles and details of the Aristotelian logic, which are here drawn upon freely, are (1), *instar omnium*, that of Prantl (*Gesch. d. Logik*, i. pp. 87–346); (2) that of Brandis, *Aristoteles*, pp. 148–434, and *Aristotelisches Lehrgebäude*, pp. 12–62 (in which there is sharp criticism of Prantl's view); (3) that of Grote, *Aristotle*, vols. i. and ii., pp. 1–134 (most patient and accurate, but tending continuously to minimize the speculative element); (4) that of St. Hilaire, in his essay *De la Logique d'Aristote*, 2 vols., 1838, and in his translation of the *Organon*; (5) that of Biese, *Phil. d. Arist.*, i. 44–319. Trendelenburg's *Elementa Logices Aristotelæ*, Waitz's edition of the *Organon*, and Ueberweg's *System der Logik* contain much of value. Mr. Poste's translation of the *Post. Anal.* and *Sophis. Elenchi*, Mr. E. Wallace's *Outlines of the Phil. of Aristotle*, and Mr. Magrath's *Selections from the Organon* will also be found of service.

differ in this, that the one rests on principles essential, necessary, seen to be true, while the other proceeds from data which are merely received as credible and as containing probable, received opinions on a subject about which there may be difference of view; and it may be added that in the one we reach conclusions which are essential, in which the predicate is necessarily and universally true of the subject, while in the other the conclusion remains, like the data, credible merely, and is, at best, only one of the probable answers to a question. But there remains the difficulty, which is certainly not cleared up by any direct statement from Aristotle—of what nature is the syllogistic inference that applies to material of this kind? what is the *nervus probandi* in a dialectic syllogism? There are two possible views—either that the principle of syllogistic inference is purely formal, deducible from the characteristic of thought as either affirming or denying in reference to a particular subject, and therefore capable of application either to probable or to necessary matter, or that the syllogism is explicable only as a form in which knowledge is established, and is applicable but *per accidens*, as one may express it, to probable matters. Under this second view, the possibility and reality of syllogistic inference would be traced to the correlative peculiarities of human thought and of the nature of the objects of thought, and it would follow that in strictness there is no dialectic syllogism. Such a conclusion at first sight appears to stand in sharp opposition to quite emphatic utterances of Aristotle, but if we suppose, for the sake of example, that a dialectic syllogism were framed, we should readily discern that the link of connection between data and conclusion, the *nervus probandi*, as it may be called, does not in fact differ from that involved in the apodictic syllogism. The merely probable character of the data prevents the conclusion from having a higher value than mere likelihood, but does not affect the chain of inference, which proceeds on assumptions identical with these involved in apodictic. Aristotle is chary of any examples of dialectic syllogism, and indeed, if one considers that all forms of modality are investigated in the general analysis of syllogism, it becomes difficult to see what specially distinguishes dialectic inference. It is not to be denied, however, that the investigation of the grounds for the coexistence of dialectic and apodictic is incomplete in Aristotle, as it confessedly is in Plato.

Unless, then, it can be shown beyond possibility of question that Aristotle does lay down purely formal rules for syllogism, rules deducible simply from the fundamental axiom of thought—and the evidence on which such a view is based will be examined later—we do not obtain much light from the opposition between dialectic and apodictic. More important results, however, are gained when we consider the Aristotelian doctrine of genuine knowledge, of ἀπόδειξις, for, among the numerous elements that here fall to be noted, some are of quite general import, and apply to the whole process of the formation of knowledge.

13. Apodictic knowledge generally is definable through the special marks of its content. It deals with the universal and necessary, that which is now and always, that which cannot be other than it is, that which is what it is simply through its own nature. It is the expression of the true universal in thought and things, τὸ καθόλου. Further, as a method, ἀπόδειξις is characterized by the nature of its starting point, and of the connecting link involved, as well as by the peculiarity of its result. It rests upon the first, simplest, best known, unprovable elements of thought, the πρῶτα καὶ ἄμεσα, which are not themselves in the strict sense matters of apodictic science, which are ἀναπόδεικτα. In all the intermediate processes of scientific proof there is involved, generally this dependence upon previously established principles, and, when apodictic is taken in its ultimate abstraction, these previously established principles are seen to be the prior, ultimate elements, assumptions in thought about things, as one may provisionally describe them. The peculiar connection involved is simply what we understand by the principle of syllogism. No syllogism is possible without the universalizing element, the καθόλου, and knowledge in its essence is syllogistic.[1] The conclusion of the syllogism in which essential attributes are attached to a subject is the concretion or closing together of the two aspects of all thought and being, the universal and particular.[2]

[1] *Cf. Topics*, pp. 164a, 10.

[2] See specially *Anal. Pr.*, 67a, 39 *sq.*, and compare the elaborate note of Kampe, *Erkenntnisstheorie des Aris.*, p. 220 (also p. 84). Grote, (*Aristotle*, i. p. 263a) remarks: "Complete cognition (τὸ ἐνεργεῖν, according to the view here set forth) consists of one mental act corresponding to the major premiss, another corresponding to the minor, and a third including both the two in conscious juxtaposition. The third implies both the first and the second." The connection between this and the Aristotelian doctrines of νοῦς in its relation to αἴσθησις will not escape attention.

The fuller explanation of apodictic thus refers us to three points of extreme importance in the Aristotelian theory of knowledge, the precise nature of the καθόλου, which presents itself as the characteristic feature of ἀπόδειξις, the relation of fundamental and universal in things on which the possibility of ἀπόδειξις is founded, and the forms of thought through which the universal and particular factors are subjectively realized. The three are most closely connected, and as they involve the main difficulties of the Aristotelian philosophy as a whole, a general treatment of them is indispensable. First then of τὸ καθόλου, the characteristic term in the explanation of knowledge. This notion is essentially double-sided. On the one side it is the universal of empirical knowledge, the generic or class universal—it is τὸ κατὰ παντός; on the other hand, it is the root or ground of the empirical universal—it is τὸ καθ' αὐτό καὶ ᾗ αὐτό,[3] that which is in, for, and through itself, the essential. Now the essential, καθ' αὐτό, is, in the first place, either that which enters into the being and motion of a thing as a necessary prerequisite (for example, *line* is a necessary element in the being and notion of triangle), or that which is the necessary basis of an attribute (*e. g.*, *line* in reference to *straight* and *curved*), or in the second place that which is as subject only and not as predicate, or finally that which is *per se* the cause or ground of a fact or event.[4] Thus the function of thought (of apodictic) is the exposition with reference to a determined class of objects of all that necessarily inheres in them, on account of the elementary factors which determine their existence and nature. Real things, individual objects, are the basis of all knowledge, but in these individuals the elementary parts, causally connected, and leading to ulterior consequences, form the general element about which there may be demonstrative science. Thought which operates upon them does so, as we have already seen, under the peculiar restriction of its very nature, as the subjective realization of the notion of things, and the principles expressing this restriction, the logical axioms, may be appealed to if demonstration be opposed groundlessly, but these axioms do not enter into the process of demonstration. "When the apodictic process has attained its end, that is, when all the universal propositions relating to a given class, with insight into the necessary character of the predication in each case, have been gathered up, then the καθόλου of knowledge in respect to that class has been realized."[5]

14. Probably the example of apodictic which Aristotle bears chiefly in mind is mathematical science, and in his treatment of the characteristic marks of this doctrine most of the peculiarities of apodictic occur. In mathematical science abstraction is made of the material qualities of the things considered, of those qualities which give to them a place as physical facts, but the abstracta are not to be conceived as entities, self-existing. They are not even to be conceived as existing only in mind, as ideal types; they truly exist in things, but are considered separately (ἐξ ἀφαιρέσεως). The first principles of mathematical science are few and definite, and the procedure is continuously from the simple and absolutely more known to the concrete and relatively more known. As in proof generally, so in mathematical demonstration, an essential quality (συμβεβηκός καθ' αὐτό) may be proved of a subject, and yet such quality may be still accidental, *i. e.*, not predicated of the subject on account of its generic constituent marks, but capable of being deduced from the constituent mark of that which enters into the subject, as, *e.g.*, a given figure's exterior angles are equal to four right angles. Why? Because it is an isosceles triangle. Why has an isosceles this property? Because it is a triangle. Why has a triangle? Because it is a rectilineal figure. If this reason is ultimate, it completes our knowledge, καὶ καθόλου δὲ τότε.[6] Thus the range of mathematical proof extends from the πρῶτα, the original definitions, which at the same time assume the existence of the things defined, through the determinations καθ' αὐτά to the qualities (συμβεβήκοτα), which can be shown to attach to their subjects, to be in a sense καθ' αὐτά, while a continuous series of middle notions, concerning which there cannot be much ambiguity, effects the transition. Moreover, in mathematical science, one can see with the utmost evidence the correlation of reason and sense, which will presently appear as a fundamental factor in Aristotle's general theory of knowledge. The πρῶτα are not to be conceived as innate or as possessed before experience. They

Arist.*, 310 *n.*, and *Bonitz, Com. in Met.*, pp. 265–66. On the distinction between καθόλου and γένος, see Bonitz, *Com. in Met.*, p. 299, 300; Zeller, *Ph. d. Gr.*, ii. 1, p. 205, 206.

[4] *Cf.* Prantl, *Ges. d. Logik*, i. 121, 122, who has rightly placed the function of καθόλου in the foreground.

[5] Prantl, i. 126.

[6] *Anal. Post.*, i. 24, 86a, 2.

are seen or envisaged, intuited in perception by νοῦς, and induction here as elsewhere is the process by which perceptions are gathered together for the reflective and intuiting action of νοῦς. In the mathematical individual, more evidently than in any other case, is visible the union of thought and sense. The demonstration which employs a diagram does not turn upon any properties of the diagram which are there for sense only, not for reason, but upon the general elementary relations contemplated in thought.[1] In mathematical development, that which is potentially contained in the ὕλη νοητή on which mathematical thinking operates is brought forward into actuality by the constructive processes through which the proof is mediated, and the potential knowledge contained in the intuition of mathematical elements becomes actual through the process of constructive thought.[2]

Finally, the relation of pure mathematical reasoning to that found in sciences generically one with mathematics, *e. g.*, optics, astronomy, harmonics, etc., furnishes an interesting example of the relation between reasoning based on fact and on causal ground.[3]

15. The process of ἀπόδειξις generally and of mathematical demonstration in particular has brought into clear light the prominent characteristic of knowledge according to the Aristotelian view. Knowledge must always be regarded from two sides, as having relation to the universal, and as bearing upon the particular.[4] It is in itself the union of the general and the particular, of the universal and the individual. This fundamental notion of knowledge is not only the integral element in the Aristotelian theory of science, but also the guiding principle in his scientific method.[5] In all cases we require to keep in mind the necessary correlation of the particular facts and the general grounds, the multiplicity of effects and the unity of cause. The one element is not apart from the other. Universals as such are of no avail either as explanations of knowledge or as grounds of existence. Particulars as such are infinite, indefinite, and incognizable. Only in the union of these, a union which objectively regarded is the combination of form and matter, of potentiality and actuality, of genus and ultimate difference, subjectively is the combination of the data of sense, imagination, and intuitive faculty of reason, is knowledge possible. And the methods by which knowledge is formed in us regarding things exhibit the same twofold aspect. Syllogism as the form of the process from generalia to the determination of attributes of the individual subject, induction as the method of procedure from the vaguely apprehended individuals to the generalia or principles, alike, when analyzed, exhibit the conjunction of the universal and particular.

16. In each branch of knowledge there are involved the specific genus or class, the attributes concerning which there is to be demonstration, and the common axioms or principles. Each branch, moreover, implies special principles, ἴδιαι ἀρχαί; there is no all-comprehensive science from which truths are to be deduced, and from the common maxims alone nothing can be inferred. Ἀπόδειξις involves principles, and starts therefore of necessity with what may be called definitions. Yet definitions are at the same time the final result of apodictic demonstration, and the original assumptions may be pushed farther and farther back till they appear as the πρῶται και ἄμεσοι προτάσεις which are only apprehended by νοῦς. From this distinction between knowledge as completed and knowledge as in process of formation, as from the distinction between sciences of the same genus as more or less general (*e. g.*, geometry and optics), there follow the distinctions between propositions necessary and propositions true ἐπι τὸ πολυ, between proof of fact and proof of essence, between deduction and induction, between syllogism as generic form of all proof, and the special type of syllogism in which completed knowledge is expressed. We are thus enabled to reconcile what seem at first sight discrepancies in the Aristotelian doctrine,—as, *e. g.*, the insistance upon induction as furnishing the principles of reasoning (τὰ καθόλυυ) coupled with the attempt to show that induction too is a kind of syllogism the explanation of proof as involving essence, coupled with the admission of syllogisms of fact; the treatment of propositions as necessary and contingent in themselves, coupled with the distinction between ἐπιστήμη and δόξα. In all forms of knowledge there is the twofold aspect, that which turns upon the essential connections, and that which refers to the isolated facts wherein such connections make their appearance. Syllogistic as formal analysis of what is common in all knowledge is one part of the all-comprehensive theory of knowledge, an integral but not a self-existing part.[6]

17. The general idea of the Aristotelian analytic thus obtained does not require to be supplemented by any detailed survey of the logical system into which it is evolved, but a brief summary of the most important points and indication of the relation in which the parts stand to the whole may be of advantage.

The simplest form of knowledge, that in which being as true or false is apprehended, is the judgment. The consideration of the judgment is therefore the first part of the analytical researches. Here Aristotle distinguishes more accurately than any of his predecessors (indeed for the first time with accuracy) between subject and predicate as integral parts, symbolized by the noun and verb, and signifying the relations for us of things as appearing under the schemata of the categories. The material basis of the judgment, as one may call it, is the thing as an object of possible knowledge, *i. e.*, the thing as individual (and therefore as involving matter and form, the particular and the general), as qualified, specifically, in time, space, quantity, and relation, and existing as one mode in the universal nexus of potentiality and actuality. These metaphysical forms, and, specially, the deep-lying modes of potentiality and actuality, reflect themselves in the forms whereby subjectively knowledge is realized in us, and the resulting knowledge is conditioned partly by them, partly by the modes in which intellect as a reality is developed in us. The proposition has necessarily a reference to them, and thus alongside of formal distinctions between universal, particular, singular, and indefinite judgments we have the distinctions between necessary, contingent, and possible, which appear partly as given qualities of the judgment, partly as representing differences in the conditions of knowledge, partly as referring to differences of subjective apprehension.

The essence of the judgment as the apprehension of truth or falsehood consists in its twofold aspect as affirmative and negative, the former of these in a sense prior and better known, but the latter no less necessary, and both referring to objective relations of things. The affirmative and negative character of judgments, the essential ἀντίφασις of human thought, is further defined in reference to (*a*) the quantitative distinctions already recognized (the doctrine of logical opposition), (*b*) the distinctions of necessary, contingent, and possible, which are rightly regarded as real matters *about which* the assertion is,[7] and (*c*), consequent on this, the opposition of modal judgments.[8]

[1] *Cf.* the passage from *De Memor.*, p. 450, quoted by Brandis, *Aristoteles*, p. 1133,—συμβαίνει γὰρ τὸ αὐτὸ πάθος ἐν τῷ νοεῖν και ἐν τῷ διαγράφειν· ἐκεί τε γὰρ ὑνθὲν προσχρώμενοι τῷ τὸ ποσὸν ὡρισμένον εἶναι τὸ τριγώνον, ὅμως γράφομεν ὡρισμένον κατὰ τὸ ποσόν· και ὁ νοῶν ὡσαύτως, κἂν μὴ ποσὸν νοῇ, τίθεται πρὸ ὀμμάτων ποσόν, νοει δ' οὐχ ᾗ ποσόν. ἂν δὲ ἡ φύσις ἢ τῶν ποσῶν, ἀόριστον δὲ, τίθεται μὲν ποσὸν ὡρισμένον, νοεῖ δὲ ἡ ποσόν μόνον. *Cf.* also *Met.*, vii. 10 and 11. Aristotle's view strongly resembles, in this point at least, that of Kant.

[2] See *Metaph.*, ix. c. 9, p. 1051a. Some interesting remarks on the process of mathematical construction and its relation to syllogistic proof will be found in Ueberweg's *System der Logik*, § 101, p. 273.

[3] See generally *Anal. Post.*, chap. 13. Of Aristotle's views on mathematics the best expositions seem to be those of Biese (*Ph. d. Arist.*, ii. 216–34), Brandis (*Aristoteles*, pp. 135–39, and *Aristot. Lehrgebäude*, 7–11), and Eucken (*Methode, d. Arist. Forschung*, pp. 56–66).

[4] *Cf.* specially *Anal. Pr.*, ii. 21.

[5] This is excellently put by Eucken, *op. cit.*, pp. 44–55.

[6] The passages in which an apparently formal view of logical relations is expressed are mainly the following:—*Topics*, i. chap. vi. (in which the fundamental logical forms of definition, genus, property, and accident are explained by reference to the coincidence of the spheres of subject and predicate in a proposition); *Anal. Post.*, i. chap. 26 (συλλογισμός ἐστιν ὃς ἂν οὕτως ἔχῃ ὥστε ἢ ὅλον πρὸς μέρος ἢ μέρος πρὸς ὅλον ἔχειν); *Anal. Post.*, ii. 3 (ἑτέρου δὲ ἑτέρα ἀπόδειξις, ἐὰν μὴ ὡς μέρος ᾖ τι τῆς ὅλης. τοῦτο δὲ λέγω, ὅτι δέδεικται τὸ ἰσοσκελὲς δύο ὀρθαὶς, εἰ πᾶν τρίγωνον δέδεικται· μέρος γάρ· τοδ' ὅλον); *Rhetoric*, i. 2, § 19. The general treatment of syllogism in *Anal. Pr.*, i. 4, as apparently resting on the principle of subsumption or logical substitution, has no precise bearing. But the use of the term ὅλον by Aristotle is not to be regarded as identical with its use by later logicians, and it is not rashly to be assumed that in Aristotle's view the only logical relation is that between genus and species. The distinction between extent and intent, on which later writers have laid strees, is never suffered in Aristotle to become a distinction in kind; the two elements, extent and content (κατὰ παντὸς and καθ' αὐτό), are always involved, and the difference is only in the process by which our knowledge is formed. Probably the relations of extent and content would never have been severed from one another had it not been for the error, almost a necessary failing in the attempt to treat formal logic systematically, of regarding notions and judgments as completely formed and defined products apart from the reasoning in which they appear (see, for a diametrically opposed view, Hamilton, *Lectures on Logic*, ii. p. 266).

[7] On this account the *modality* is affirmed not to attach to the copula; thus the opposite of "it is necessary-to-be," is "it is not necessary-to-be," and not either "it is necessary-not-to-be," or "it is not-necessary-to-be."

[8] There are obscurities in Aristotle's doctrine of modals, which remain even after Prantl's laborious treatment (*Ges. d. Logik*, i. 104–82). A careful survey is given in Rondelet, *Théorie logique des propositions modales*, 1861. The definitions of ἐνδεχόμενον and δυνατόν, which have given rise to much diversity of opinion (*cf.* Prantl, i. 167 *sq.*, as against Waitz, i. 376, and Bonitz, p. 387) are excellently dealt with by Ueberweg, *Logik*, § 69.

Propositions as integral parts of knowledge turn upon the ultimate relations of things known. The distinctions between first principles and deduced truths, out of which the theory of proof is developed, themselves rest upon those distinctions which have been already noted in treating of apodictic. Syllogism as the form by which the general and particular elements are mediated and conjoined is therefore of universal application, and may be analyzed formally.[1] The various modes in which syllogistic inference, pure or modal, the main types to which these modes may be reduced, their relations to one another, and the general laws implied in them are worked out in a fashion which does not admit of any brief statement. The conclusion unites the elements which in isolation appear in the premises, and is, in a sense, the complex or organic whole unfolded in the syllogistic form. To every syllogism three things are necessary, the presence of a positive element, universality in one of the premisses (resting, as above shown, on the recognized property of all proof as involving a general fact), and *consequence*, or necessary connection between conclusion and premisses. Now from this third element there follow certain interesting deductions. The necessity of consequence rests on the very nature of syllogistic thought, and if each syllogism be taken as it stands, as a simple unit, no further inquiry is needful. But the character of the premisses in themselves may be taken into account, and we then discover that syllogism proceeds continuously on the assumption that the general law of syllogistic proof is in the special case realized. It need not be in fact realized. We may have premisses in themselves false, from which a true conclusion is reached, and the falsity of the premisses only becomes apparent when they are themselves treated as conclusions of a possible syllogism, and so the regress made towards ultimate principles. Syllogistic form, in short, is the hypothetical application of the general rule of necessary connection between ground and consequent. If A (the premisses), then B (the conclusion). Quite possibly, then, we may have, in syllogistic form, conclusions drawn from premisses not ἀναγκαῖα but only ὡς ἐπὶ τὸ πολυ. Science and opinion (δόξα) are equally sources of propositions or premisses. If formal consequences be united with real uncertainty of matter, there arises a syllogism in character dialectical. Were the real uncertainty overlooked, the syllogism would be sophistic in character. Dialectical reasoning, then, dealing with the stage beneath science, may be of service, not only for practice in distinguishing true and false, but as bringing the particulars of each branch of knowledge into closer relation with the first principles special to that branch.[2] For wherever the particular element as such, the transitory and material, is present, there room is left for opinion, and reasoning is possible, not of the particular as such, but in so far as the particular manifests an underlying universal.[3] The processes of dialectic reasoning thus resemble very closely those modes by which the empirical detail, the region of given fact, is treated, viz., induction, example, use of signs and probable indications. For the universal has always its empirical side, and the complete process of scientific proof is a final result for which the way may be prepared by treatment, according to scientific form, of the empirical fact. There are syllogisms of fact as well as syllogisms of reason or ground, and the reason or ground becomes apparent through knowledge of the fact. Occasionally indeed the fact and ground are so immediately connected that transition from one to the other may be at once effected, but generally this is not the case.

Of these intermediate forms of reasoning, the only one calling for comment is induction, of the nature of which something has already been said. The obscure chapter in which the formal analysis of induction is undertaken, a chapter which has much exercised the ingenuity of commentators,[4] presents difficulties of varied kinds. An opposition is indicated between syllogism and induction, yet induction is treated as a kind of syllogism; that is, freely interpreted, induction is so analyzed as to show that in it, also, there is the union of general assumption and particular detail which is characteristic of syllogistic reasoning. Further, Aristotle seems to waver between induction as a kind of inference, through which we arrive at general principles, and as a species of proof, and his teaching is therefore perplexed by the want of some clear statement regarding a difficulty in the theory of induction, which is still far from perfect solution. For, according to Aristotle, induction as such, starting from the particulars of sense, and proceeding by comparison of similar cases and enumeration of all the similarly constituted members, never, even when the enumeration is complete, attains to probative force.[5] It is still a syllogism of fact, not of ground or reason; there is a distinction of kind between the survey of empirical detail, even when complete, and the assertion of causal connection between the characteristics of the class and its deduced properties.[6] Thus, perception of the law (τὸ καθόλου) from induction is a kind of new element in the process; it is recognition *by means of* the empirico-critical survey which is the essence of induction.[7] Induction makes clear only, and does not prove.[8] If we interpret according to more modern phraseology, this peculiarity may be expressed as the distinctive feature of inductive research based on facts or effects. We do not regard the inquiry as terminating in the establishment of a law until it is possible to reverse the process and show that from the surmised cause the effects do actually follow. Otherwise we have a conclusion of "coexistence" merely—an empirical rule or generalization. If, bearing in mind these sources of difficulty, and also the correlation which for Aristotle always obtains between empirical details and grounds of reason, we consider the example given in the obscure chapter before us, some light may be cast on the exposition there given. The example selected is one touched upon by Aristotle in other two passages, in the treatise *De Partibus Animalium*, and in the *Post. Anal.*, ii. 18.[9] As regards the first of these, reference is desirable only to bring out the fact that causal nexus is the καθόλου in question; the second is of the utmost importance as clearing up what has always seemed an obscurity in the account of the inductive syllogism. In the chapters 16–18 of *Anal. Post.*, ii., Aristotle considers the relation of cause and effect as the essential basis of proof, and he points out with much clearness the difference between the fact as cause of knowledge and the cause as ground of existence and proof. In some cases cause and effect are so united, so reciprocate, that we may infer from one to the other. But the doubt arises, may there not be more than one cause for any given attribute, in which case all such inferences from effect must become problematical. Aristotle's solution is remarkable, both in itself and in its bearing on the inductive syllogism. Suppose the attribute β is found in all individuals of a class A, and also in individuals of class B, C, etc. In order to discover the cause, investigations must be carried on until we have a defined number of classes, A, B, C, etc., in all of which β is found, and which comprehend all cases of the presence of β. Then that which is also common to A, B, C, etc., may be regarded as the cause of β, say, *e. g.*, an attribute α. If this attribute α be really the cause of β, it will enter into its definition; it will be its definition. There might, however, be a connection of α and β of this universal and reciprocating kind, and yet α might not be the cause in question; it might be only a fact from which β could be inferred; the real cause γ, which gives rise to α, lies in the background. Characteristic of causation, then, is constant reciprocal conjunction of facts. Even if it be admitted, then, that there may be more causes for a phenomenon than one, it will yet be true that each of these causes will be manifested in one class of phenomena where there will be the universal reciprocating coexistence that is characteristic of the relation in question. Thus the attribute longevity observable in quadruped animals and in birds may be due to different causes, *e. g.*, to absence of gall in the one case, to predominance of solid, dry matter in the other. But in each case there will be a definite species characterized by the constant conjunction of the cause and the causatum; the whole class long-lived animals and the class gall-less animals will coincide.

Turning now to the chapter on inductive syllogism, we find induction defined as inference through the minor that the major belongs to the middle. Here evidently major

[1] In this sense only can we recognize the distinction between Aristotle's *Technik* and his idea of *Apodiktik* on which Lange (*Logische Studien*, 1880) has laid so much stress. What underlies Aristotle's treatment must never be thrown out of account.

[2] *Topics*, i. 2, §§ 3–6.

and middle are regarded not as determined by form only but naturally distiuct, and we must assume that by middle term is to be understood the grouud or reason of the attribute (major term) eharacteristic of a defined species or group (the middle term). Were our knowledge complete and scientific, we should be able to express this in apodictic form:—whatever auimal has no gall is long-lived; man, horse, mule, etc., arc animals having no gall; therefore they are loug-lived. The progress of knowledge, however, may be from the empirical details. We may havo given to us the fact of the attribute, long-livedness, in the group of animals, man, horse, etc., and discover that theso long-lived animals are also wanting in gall. If then, in accordance with the rules above sketched, there can be discovered a reciprocating relation between want of gall in animals and long-liveduess, if we ean eonstitute a elass distinguished by coujoint presence of gall-lessness and lougevity, we have the basis for an inductive proof. We may infer therefrom that gall-lessness is, *in this species*, the cause of longevity. Such a reasoning is founded on particulars given, and as the coexistence is given, the conclusion seems to be immediately drawn; there does not appear to be mediation or use of a middlo term; nevertheless the middle term is implied, not in the supposition that the two elasses reciprocate, bnt in tho transference from empirical coexistence to eausal nexus.

Aristotle's mode of stating this argument has presented so many difficulties of interpretation that various emendations have been proposed. Groto, *e. g.*, who has not apprehended why the class long-lived animals should be taken universally,—"we are," he says, "in no way concerned with the totality of long-lived animals,"—suggests an emendation, which makes the essence of the inductive reasoning turn upon the extension of what we know regarding some gall-less animals to all of that class. But this is not the inductive step according to Aristotle. Induction has not to prove or assume that α and β, fonnd coexisting in some members of a species, coexist in all of them; Aristotle takes this universal coexistence for granted as the basis of the argument. The inductive step is the transference from this universal coexistence to causal nexus. Apodictically, we should say, if α is the cause of β, then all A which possesses α possesses β; thus reasoning from ease to easatum. Inductively we say, all A which possesses α has β; therefore α is the cause of β.[1]

Induction, as dealiug with particulars, starting with the sense data, and resting upon the more evident faet in order to point towards the essential ground or reason, is therefore more persuasive, more palpable, more adapted for popular iuquiries, and relatively more apparent. Syllogistic proof, on the other hand, is more stringent, and more efficacious in establishing a scientific conclusion or position.

[1] The following is the relative portion of chap. 23 of bk. ii. of *Anal. Pr.*:—"Now induction aud syllogism through induction is the process of concluding by means of the minor term that the major term is predicable of the middle" (that is to say, of concluding from given facts that an attribute found in all of them is the effect of some other attribute also found in all of them). "For example, if B be the middle term, A and C the extremes, we show, by means of C, that A is predicable of B; for this is the inductive proeess. Thus, let A be long-lived; B, those wanting gall; C, individual long-lived, as man, horse, mule. Then A is predicated universally of C" (that is to say, the attribute A is found in all the examples before us), "for also that which wants gall is long-lived;" (that is to say, as a given fact, gall-lessness and longevity in the species, group, before us coexist). "B, wanting gall, thus is predicated universally of C. If then B and C be reciprocating, if C do not extend beyond the middle term" (that is, if we do not find other animals than the long-lived animals enumerated which also are devoid of gall), "it is necessary that A should be predicated of B. For it has been shown previously that if two terms are predicable of the same third, and if the extreme reciprocate with one of these, then the other of those predicates will be predicable of that with which the first reciprocated; but it is necessary to know that C is the complex of all the individual cases." The last sentence is extremely hard to interpret. The expression τὸ ἄκρον occurring in it is generally the technical word for major term, but as in the syllogism before us the major term is one of the predicates, this signification would seem to contradict the words πρὸς θάτερον αὐτῶν. Hamilton reads τὸ μέσον, which makes the argument intelligible and coherent with the passage apparently referred to in δέδεικται πρότερον, viz., *Anal. Pr.*, ii. 21, p. 68a, 21–25. Probably Aristotle uses τὸ ἄκρον here as equivalent to C, the ἄκρον through which the induction proceeds. According to the view taken above, the essence of the Aristotelian induction does not at all lie in the universalizing of C, but in connecting in one proposition the attributes B and A found to coexist in the group C. There is thus in one sense no middle, for cause is not reached; in another sense there is, for C is the material link connecting A and B. Aristotle then might naturally use ἄκρον for C, and assimilate the process of induction to a syllogism in which there was reciprocation of terms. In fact, however, induction regarded after his fashion results merely in the constitution of a group or class characterized as possessing two attributes in common.

Aristotle's mode of dealing with induction, in so far at least as any specific process is desiguated by that term, seems on the surface to diverge widely from modern logical theory, and we look in vain in his aualytical researches for consideration of the methods of observation aud experiment which has come to be recognized as the essential portion of a doctriue of inductive reasoning. Yet it may fairly be argued that in modern theories the term induction is used with great laxity, so as to cover either all processes connected with scientific method or some one special feature of scientific reasoning, and that the difference between the Aristotelian and modern views lies mainly in the matter, not in the form, of the process. For there are numerous hints in Aristotle respecting scientific procedure,[2] and, if we consider what is peculiar to modern views, we shall find that it consists mainly in the increased fulness and complexity of our fundamental scientific notions, a fulness and complexity resulting from long-continued scientific research. Our modern logic of induction has profited mainly by the general advance of scientific method, and tends to increase as these methods, by constant contact with facts, become more refined and accurate. The additional cautions or limitations which we now introduce into our statement of the principles of inductive research concern not so much the form of inductive proof as the character and modes of obtaining evidence which is to satisfy the canons or rules of proof. Such limitations become apparent only through actual scientific progress, not by analysis of the form of scientific proof.

18. To Aristotle, as has been above said, proof is essentially syllogistic or deductive in character. Not every syllogism is an apodictic proof, but all proof is syllogistic. For proof or adequate knowledge is reference of effects to their causes, and the cause is the general element, τὸ καθόλου, which forms the middle term in apodictic proof. Now proof by means of the cause or reason implies the existence of the cause; the inquiry why a thing is is useless unless we know or assume that the thing is. If it exists, then the cause or reason of its so existing is that which gives it a definite character or position; it is, in technical phraseology, the form of the thing. But the form of the thing, regarded apart from the material, accidental element essential to its concrete existence, is that which we express in a definition. Proof and definition are thus most closely connected. The *terminus* to which proof tends, not realized in all cases of proof but certainly in the most perfect, is the definition, and, besides, if we closely examine proof, and find that ultimately we can force back the chain of middle terms up to certain ultimate, primary universals, disclosed by νοῦς, and that the nature of these primary universals is stated in their definition, we see further that definition is connected with proof as the *terminus* from which proof starts. The exposition of definition is thus the crowning portion of Aristotle's theory of apodictic method.[3] In it we have brought into close, though not explicit, relation, the fundamental notions on which his logic rests,—the notions of the essence, universal, genus, and specific difference. Definition, as concerned with that which is involved in demonstration, the ground or reason, is in cases where the reason and consequent are separable the sum of the demonstration; it is the compressed statement of the connection between the subject and the attribute demonstrated of it, *i. e.*, in a syllogism of the first figure, the major term.[4] Frequently a definition merely states the demonstrated attribute in relation to its subject, without indicating the rational link.[5] Such definitions, however, are defective, just as the

[2] See, for example, the discussion in *Topics*, i. 17–18; ii. 10–11, on similarity; in the *Post. Anal.*, i. 13, on deductive and inductive methods; in *Post. Anal.*, ii. 13, on the formation of definition; and in *Post. Anal.*, ii. 12, 14–18, on the relation of cause and effect.

[3] It does not seem necessary here to consider in detail the peculiarities of apodictic as these are laid out in the first book of the *Post. Anal.*, nor to deal with the doubts raised regarding definition and proof in the first chapters of the second book. The substance of these difficult chapters can be readily summarized. If definition be taken as a finished result, it seems to stand in no relation to proof, and indeed it is hard to discover how it comes about at all. For definition supposes that which is implied in proof, the existence of the thing defined, and, moreover, it is in a special sense a unity, containing no distinction of subject and predicate, whereas such distinction is of the very essence of a demonstrated proposition. Neither in province, nor in method, nor in result, do definition and proof coincide. All this follows, however, from an abstract separation of the form or essence of the thing defined from the concrete nature of the thing. The essence is not to be taken apart; the definition does not pre-exist as a given fact. The essence is the reason of the fact, and is only discoverable when there is the recognized distinction of fact and reason of the fact. We must consider definition in the same manner as being involved in and resulting from the genesis of scientific knowledge.

[4] ἀπόδειξις θέσει διαφέρουσα, *Anal. Post.*, i. 8, p. 75b, 31.

[5] συμπέρασμά τι ἀποδείξεως, *ibid.*

conclusion of a syllogism, if taken *per se*, is defective.[1] A genuine definition is the statement of the essence, which in mediated notions is the cause or middle term of the demonstration, in immediate notions is directly assumed.[2] A merely nominal definition or explanation of what a name signifies is but a preparatory stadium in the progress towards real, genetic definition.

Definition, then, like demonstration, rests on the essential or rational ground, the notion of the thing. The rational ground or notion has its empirical aspect; it determines a class, and thus, just as in demonstration we may have forms of reasoning based primarily on the empirical details, so in framing definitions we may proceed from the empirical class, and may formulate rules for defining which bear special reference to the genus or body of individuals. In such procedure there is always involved the general idea of the essence or notion as the determining universal, and without this general idea the subsidiary methods, induction and division, do not yield scientific definition.

To frame a definition, then, *i. e.*, to discover the elements whose combination as an essential unity makes up the notion of the things defined, we select the predicates belonging to the things in question, but also attaching to other species of the same genus. The combination of such predicates which is not found in any other species, which is, therefore, reciprocable with the essence or form of the species, is its definition. The definition, therefore, contains the genus and the specific attribute (or combination of attributes). Of these elements, the genus is the least important; the truly essential factor is the specific difference, and in order that our definition should be ultimate, we must follow out the line of specific difference by which a genus may be divided until we reach a final, irreducible characteristic or group of characteristics, constituting a lowest species (or natural kind, if one were to employ a term made current by J. S. Mill). The systematic following out of the specific differences is logical division; the critical comparison of points of similarity in species of the same genus, so as to obtain a higher generality, has no special title accorded to it, but it resembles the Socratic and Platonic induction (συναγωγή). Division proceeds on the oppositions actually found in nature; and, though, doubtless, the division by dichotomy has formal advantages, it has not, as a process of real cognition, any supreme value. The negative as such is the inconceivable, and presents nothing for cognition.[3] And division is not dependent on exhaustive knowledge; it is not necessary that, in order to recognize A as distinct from B, we should know the whole universe of possible objects of cognition. A and B may be recognized as identical or distinct in essence, even though they at the same time possess distinct or identical accidental marks. Knowledge, in other words, turns upon the essential, not upon the numerical universal.[4] It is only needful, then, that in the systematic process of indicating the elements of definition, all must be included that concerns the essence, that the order must be strictly from determining to determined (or from more abstract or general to more concrete or special), and finally that the enumeration be complete. The final division or species reached is the notion of the thing, and its expression is the definition.

19. The analytical researches thus manifest themselves as a real theory of knowledge and as forming an integral part of the Aristotelian system. Logical relations are throughout conditioned by the characteristics of the Aristotelian metaphysical conception, and the distinction of the formal or technical from the real in cognition has no place in them. No point is more frequently insisted on by Aristotle than the impossibility of deducing any scientific principles or results from the fundamental axiom of thought, the law of non-contradiction. In the Aristotelian system this axiom appears simply as the generalized expression for the peculiar characteristic of thought, its potentiality of truth or falsehood. Such potentiality accompanies thought throughout, and is the mark of its subjective character, but the actuality of thought is something quite distinct, and is only realized through the various processes whereby the world of fact is apprehended. Beyond a doubt knowledge has a general aspect and there is thus possible a general theory of knowledge, but this is not to be regarded as merely a development from the fundamental axiom of thought. It is the general statement of what constitutes actual cognition, and thus refers on the one hand to the ultimate properties of that which is to be known, on the other hand to the qualities of knowledge as a subjective, though not the less real, fact. For to Aristotle subjective has not the sense which it may be said to have assumed in modern logic, mainly through the Kantian analysis. The activity of thought which realizes itself in the consciousness of the individual is not a mere formal process of apprehension, mirroring or depicting reality that is totally distinct from it. It is a reality, one aspect or phase of the total sum of things, and its development is a real process correlative with the development inherent in things as a whole.

At the same time it is impossible to overlook the difficulties which attach to the Aristotelian conception, and the consequent obscurities or perplexities in his logical researches. To remain always true to the fundamental conception of thought as one factor or phase in things, to trace its form in such a mode as never to lose sight of its essential correlation to the development of reality, is in itself the hardest task for any thinker, and presupposes a more completed metaphysic than is to be found in Aristotle. Some of these difficulties may be briefly noted, as they form the turning points of certain later doctrines. The judgment or proposition is taken as the initial, the simplest phase of the activity of thought, and so as having the simplest relation to things. But the distinctions of things which are subjectively seized in the judgment are too much regarded as given facts, and Aristotle is thus involved in a difficulty respecting the import, the truth or falsity, of the judgment. The presence of this difficulty is specially discernible when he attempts to deal with the temporal reference in the judgment, with the doctrine of opposition, and with the nature of modality. Thus, he notes that the verb, the essential part of the predicate, has a temporal significance, but he also notes that in universal judgments there is no reference to any specific time, and also that the copula, the verb *is*, has no existential meaning. He is thus driven to the enunciation of a view, common among recent logicians, that the judgment is a reflective or critical act pronouncing on the truth or falsity of a contemplated separation or conjunction of facts, while, on the other hand, the very contemplation of conjunction or separation has appeared as the essence of the judgment. So, in dealing with opposition, he distinguishes contradictories from contraries, and is inclined to refer the second to the given nature of facts, wherein extreme oppositions of members falling under the same genus are presented. Modality, likewise, he treats confusedly, for the assignment of the modal relations to the predicate does not sufficiently determine their place in a theory of judgment, nor explain the relation in which they stand to the judgment as the simplest activity of thought.

Further, in dealing with the quantity of judgments, Aristotle is perplexed by his own theory of what constitutes generality. He is compelled to throw together universal judgments of a totally distinct kind,—empirical and rational, as one may call them,—and though the underlying view that empirical universality is the expression of, and is dependent on, rational connection is made sufficiently clear in the doctrine of proof, it is not carried out to its consequences in the doctrine of judgment. Finally, to note only the crowning difficulty, the theory of proof and of definition turns upon the nature of the essential connection of attributes in a subject, but the explanation of essence is precisely the lacuna in the system. Indications of a theory of essence are not wanting, but it does not seem possible so to unite them as to form a consistent whole. The greatest obscurity still hangs over the fundamental part of the system, the nature of the πρῶτα which are apprehended by νοῦς, of the specific relation of attributes καθ' αὑτα to their subjects, and of the ἴδιαι ἀρχαί from which particular sciences start. That the πρότασεις ἄμεσοι, so frequently adduced as integral parts of proof, are analytical judgments[5] cannot be accepted without such qualifications as to render the use of such a term misleading; but what their precise nature is remains in the Aristotelian system undetermined.

Logic from Aristotle to Bacon and Descartes.

20. The long history of philosophic thought from Aristotle to the beginning of the modern period furnishes no new conception of logic so complete and methodical as to require detailed treatment, but exhibits alterations in special doctrines, additions, and new points of view numerous enough to account for a certain radical change in the mode of regarding logic which is, for our present purpose,

[1] *De Anima*, ii. 2, p. 413a, 13 *sq.*

[2] ὁ δὲ τῶν ἀμέσων ὁρισμὸς θέσις ἐστὶ τοῦ τι ἐστιν ἀναπόδεικτος.

[3] Just as the ὄνομα ἀόριστον is said to have no significance save as the summary of a proposition, while a negative proposition has significance only in regard to the corresponding positive.

[4] The reference is to a theory advanced by Spensippus; see Prantl, i. 85. Aristotle here touches on a logical problem which has troubled many logicians. It is the same difficulty that arises when the question of plurality of causes is considered.

[5] As Zeller will have it; see *Ph. d. Gr.*, ii. 2, 191, *n.* Doubtless Aristotle does define an essential attribute as being one contained in the subject or one of which the subject notion is an integral part, but this relation of *entering into the definition* is not to be identified rashly with the modern view of the analytical relation of subject and predicate.

the only interesting feature. This change may perhaps be expressed not inaccurately as the tendency towards formalizing logic. Gradually logical researches came to have their boundaries extended in one way by the introduction of new matter, and narrowed in another by restriction of logical consideration to one special aspect of knowledge. Much in the history of this movement still remains in obscurity, but the general result is sufficiently clear. The periods into which the historical development of logic throughout this long interval may be naturally divided, with their main characteristics, are the following: (1) *The Peripatetic School*, represented by Theophrastus and Eudemus, following in the main the Aristotelian tradition, but deviating in certain fundamental respects, and on the whole treating the matter of logical research as though it were separate from and independent of the theory of knowledge as a whole. To this school is due the distinct recognition of the hypothetical and disjunctive proposition and syllogism, and the more complete enumeration of the possible valid modes of categorical reasoning. In both cases the additions are made to turn upon purely formal considerations. The hypothetical and disjunctive judgments are treated as given varieties, to be discerned in ordinary language and expression, not as resting upon any fundamental distinct principle or activity of thought.[1] The addition of five indirect moods to those recognized by Aristotle as belonging to the first figure proceeds on the purely formal ground of difference in position of the middle term in the two premisses. (2) *The Epicurean and Stoic Logics.* Of these the Epicurean presents no points of interest. The Stoic logic, on the other hand, is the first example of a purely formal doctrine based on and associated with a thoroughly empirical theory of cognition. In essence the Stoic doctrine is identical with that of Antisthenes, above noted, and it is interesting to observe that, under the purely nominalist theory, logic becomes almost identical with the doctrine of expression, or rhetoric. The theory of naming, and that of the conjunction of names in propositions, are the fundamental portions of the body of logic. Naturally the Stoic logicians tended to increase the bulk of logic by introducing numerous distinctions of language, and by signalizing varieties of judgment dependent on varieties of verbal expression. (3) *The acceptation of Logic among the Romans.* Here there must be distinguished the quasi-rhetorical logic, such as is found in Cicero, which is altogether Stoic in character, and the Aristotelian logic, as developed by Boetius with the additions of the later commentators. In Boetius one notes specially the technical or formal character of the treatment, which was of special importance historically, from the fact that the earlier scholastic writers derived their main knowledge of logic from certain of the treatises of Boetius. (4) *The Scholastic Logic.* On the details of the scholastic logic it is not necessary to enter, but there must be noted the following points as of interest in determining what may well be called the current conception of the Aristotelian logic in modern times. The earlier scholastics, in possession of but few of Aristotle's writings, added nothing of importance to the body of logical researches, and the permanent subject of discussion, the nature of universals, did not, through any of its solutions, affect the treatment of logical doctrines. The introduction of the body of the Aristotelian writings was contemporaneous with the introduction of the Arab writings and commentaries into western Europe, and there grew up therewith a more developed treatment of what may be called the psychological element of logic. The logic of the later scholastics is characterized by two points of interest, historically unconnected, but having a natural affinity,—the one, the introduction of an immense mass of subtle distinctions, mainly verbal, making up the body of the *Parva Logicalia*, the other, the influence of the nominalist conception of thought.[2] The peculiarity of the nominalist view is the severance of immediate apprehension from discursive thought, the assignment of all matter of knowledge to the one, and of all form to the other. But form, under this conception of discursive thought, can be found only in the generalizing function of signs or names: accordingly the fundamental processes of logical thought are regarded as so many modes of application of names. The later nominalist logicians were thus naturally led to the expenditure of immense subtlety and diligence on the thorny problems of the *Parva Logicalia*, while at the same time the peculiar inner difficulty of the theory became apparent as its consequences were worked out. (5) *The Reaction against Aristotelianism and the Humanist Modification of Logic.* Little of positive value for logical theory is offered by the numerous works representing this stage of historical developments. Valla, Agricola, and Vives, with much good criticism in general spirit and detail, present a rhetorico-grammatical logic that resembles most closely Cicero's eclectic reproduction of Stoicism. Ramus, the only logician of the period with historic renown, contributes really nothing to the history of logic, his innovations consisting mainly in the omission of the most valuable portions of the genuine Aristotelic logic, the insertion of practical and interesting examples, and finally rearrangement or redistribution of the heads under which logical doctrine was expounded. The Ramist school, most numerous and flourishing, produced no logical work of the first importance.[3]

The net result of this whole period was the severance of a certain body of doctrine, formal in character (the theory of second intentions), from theory of knowledge generally, and from all the concrete sciences. The boundaries and even the functions of this doctrine remained unfixed, for difference regarding fundamental points of extra-logical theory led to difference in mode of treatment, as well as to difference in conceptions of the end and value of logic.

Logic of Bacon and Descartes.

21. Modern reform of logic, by which may be understood the attempt to place logical theory in a more close and living relation to actual scientific method, begins with Bacon and Descartes. To both the scholastic logic presented itself as the essence of a thoroughly false and futile method of knowledge. Neither had the acquaintance with the genuine Aristotelian system requisite in order to distinguish the elements of permanent value from the worthless accretions under which these had been buried, and, as a natural consequence, the views of both have a far closer resemblance to the Aristotelian doctrine than might be imagined from the attitude of opposition common to them. Both thinkers were animated by the spirit of reformation in science, and both emphasize the practical end of all speculation. For both, therefore, logic, which to neither is of high value, appeared to be a species of practical science, a generalized statement of the mode in which intellect acquires new knowledge, in which the mind proceeds from known to unknown.[4] But such a conception of logic is, if the expression be permitted, formal; that is to say, the actual province of logic is not determined thereby, but awaits determination from the further idea of the nature of knowledge and the ultimate constitution of that which is to be known. When this point is reached, a radical divergence presents itself between the views of Descartes and Bacon, consequent on which appears a radically divergent statement of the main processes and methods of logical theory.

To Descartes the ideal of cognition is the mathematical, that in which from assured and distinct data we proceed by strict sequence of proof to determine accurately and completely the nature of complex phenomena. Such an ideal, extended so as to embrace knowledge as a whole, dominates the whole of the Cartesian speculation, and, as in the case of the Socratic doctrine of knowledge, is the ground of the Cartesian doubt. Perfect certainty, *i. e.*, clearness and distinctness of principles, logical consecutiveness of deduction from them, and exhaustive enumeration of details—such are the characteristics of completed knowledge. There follow naturally therefrom the main processes of knowledge:—*intuition*, by which the simple data and axioms are apprehended; *induction*, or exhaustive enumeration of the elementary factors of any phenomenon; *deduction*, or determination of the complex as the necessary result of the combination of simple factors. To the processes of induction and deduction, when viewed more generally, the titles analysis and synthesis may be given.[5] On other portions of logical theory Descartes does not enter, and the text-books of the Cartesian school, even the celebrated Port Royal logic, do little more than expound with some freshness such of the older material as seemed capable of harmonizing with the new conception.

Two things only require note in respect to the Cartesian logic, apart from its freshness and completeness; the one is the obscurity which hangs over the nature of intuition; the other is the step in advance of the scholastic logic

[1] The nature of hypothetical inference and its law are recognized with the greatest distinctness by Aristotle. From his theory of essence as causal nexus, any distinction of kind between an apodictic (categorical) syllogism and a hypothetical of the type contemplated by later logicians was impossible and needless.

[2] The first of these is no doubt, as Prantl has labored to prove, Byzantine in origin, but it still remains doubtful whence the Eastern logicians draw. The most probable source is the Stoic writings.

[3] See note C, p. 812.

[4] Comp. *Princip., Phil., Pref.*; *De Aug. Sc.*, bk. v. chap. 1, 2.

[5] See *Regulæ ad directionem ingenii*, Nos. 2, 3, and especially 7. The celebrated rules of speculation (*De Methodo*) are only a more popular statement of the same processes.

effected in the assimilation of deduction to synthesis. As regards the first, the criteria laid down by Descartes, viz., clearness and distinctness, are unsatisfactory and ambiguous. It is evident that he implied under these clear and distinct recognition of *necessity* in the data or principles, but the nature of this necessity is never made clear.[1] As regards the second, it was of importance to signalize, as against the scholastic view, that the universal in thought or reasoning was not only of the nature of the class notion, that genera and species were not the ultimate universals, but were themselves secondary products, formed by reasoning and based upon essential connection of facts. In this Descartes was but returning to the genuine Aristotelian doctrine, but his view has all the advantage derived from a truer and more scientific conception of what these connections in nature really are.

22. What is peculiar in the logic of Bacon springs likewise from the peculiarities of the underlying conception of nature. The inductive method, expounded in the *Novum Organum*, is, however, only part of the Baconian logic, and, since it is commonly regarded as being the whole, a brief statement of what Bacon included under logic may here be given.

Viewing logic as the doctrine which deals with the use and object of the intellectual faculties, Bacon divides it (in this approximating somewhat to the extended division of the Stoic logicians) into (1) the art of inquiry or invention, (2) the art of examination or judgment, (3) the art of memory, and (4) the art of elocution or tradition. The third and fourth divisions are unimportant; the first and second might be called respectively the theory of the acquisition of knowledge and the theory of evidence or proof. The art of inquiry is subdivided into the art of the discovery of arts and the art of the discovery of arguments. The second of these Bacon regards as identical with the *Topics* of the Greek and Roman dialectic, and therefore as of comparatively slight value. Of the first there are two main branches:—(A) *Experientia Literata* and (B) *Interpretatio Naturæ*. The art of judgment has two subdivisions:—the examination of methods of reasoning—induction and syllogism—which resembles the older analytic; and the examination of errors of reasoning—whether these be sophistical, *i. e.*, the logical fallacies of the older doctrine, or errors of interpretation to be removed by careful criticism of scientific terms, or arising from erroneous tendencies of the mind (the doctrine of *idola*)—which resembles the older treatment of *Elenchi*.

The peculiarity of the Baconian logic, then, must be sought in the processes included under the art of discovering arts or knowledge. Among these the syllogism is not included. It is a process with no practical utility; it involves premisses of which the truth is simply assumed, and consequently its conclusions can have no validity beyond that of the premisses; it affects to determine the particular from the general, but in fact nature is much more subtle than intellect, and our generalizations, which are but partial abstractions, are quite inadequate to afford exhaustive knowledge of the particular; it throws no light upon the essential part of cognition as a process in formation, viz., the method by which we are to obtain accurate notions of things, and judgments based on these notions. Moreover, the deductive or syllogistic procedure favors and encourages the tendency to rash generalization, to the formulation of a universal axiom from few particulars, and to the uncritical acceptance of experience. If syllogism exist at all, there must be a prior process, that of generalizing by rigid and accurate methods from experience itself. Syllogism is not entirely worthless. It is of particular service in some branches of science (*e. g.*, the mathematical), and generally may be employed so soon as the principles of a science are well established; but it is a subordinate and secondary method.

The art of discovery, then, is the method of generalizing from experience. What this method shall be depends entirely on the thinker's conception of experience. Now Bacon's conception is perfectly definite. Observation presents to us complex natures which are the results of simpler, more general forms of causes. From the complex phenomena these forms are to be sifted out by a methodical process of analysis and experiment. A general proposition is one stating the connection between complex natures and their simple forms or causes; it is therefore the result of a graduated process. No doubt there may be generalizations based only on an ingenious comparison of the complex phenomena as they are presented to us; such a process Bacon calls *Experientia Literata*, and the maxims recommended for it much resemble the ordinary methods of experiment, but truly scientific knowledge is only to be obtained by the complete inductive method. The characteristics of this inductive method follow at once from the nature of the object in view. The form which is sought can be detected only by examination of cases in which the given complex effect is present, in which it is absent, and in which it appears in different degrees or amounts. By a critical comparison of these cases we may be able to detect, and, were the enumeration exhaustive, we must infallibly detect, by process of exclusion or elimination, a phenomenon constantly present when the effect is present, absent whenever the effect is absent, and varying in degree with the effect. Such a phenomenon would be the *form* in question,—the cause of the given fact or attribute. Exhaustive enumeration is, of course, an ideal, and therefore the method of exclusion can never be perfectly carried out, but all additional aids have significance only as supplying in part the place of exhaustive enumeration. We may, on the basis of a wide examination, frame a first generalization (*first vintage* as Bacon metaphorically calls it), and proceed to test its correctness by carrying out the critical comparison with it in view. Or we may, under the guidance of our leading principle, take advantage of certain typical cases presented by nature, or force cases by experiment in such a way as to supersede the enumeration. There are *prerogative* instances, critical phenomena, helpful in discovery of the cause of a phenomenon. Of other *adminicula*, or aids to induction, only the titles are given by Bacon, and it would be hazardous to conjecture as to their significance.[2]

The Baconian logic, then, or at least what is peculiar to it, is thoroughly conditioned by the peculiarities of the Baconian metaphysic or conception of nature and natural processes. As to the novelty of the logic, this to us does not appear to lie in the mere fact that stress is laid upon induction, nor do we think it correct to assign to Bacon the introduction of the theory of induction as an integral portion of logic. But it consists in the new view taken of what constitutes the universal in thought, a view which may be inadequate, but which colors and affects every process of thought, and therefore every portion of logical theory. It is but a consequence of Bacon's narrow view of the essence of syllogism that he should set induction in opposition to deduction, and regard syllogism as of service only for communication of knowledge. His inductive methods are throughout syllogistic in this respect, that they, like all processes of thought, involve the combination of universal and particular. Experience is interpreted, that is to say, viewed under the light of a general idea or notion.

Logic on the Basis of Psychological Empiricism. Locke, Hume, Mill, Condillac.

23. The universal element in thought which is recognized by Bacon as present received from him no special treatment. His theory of the nature of knowledge offered no explanation of the origin, significance and validity of the notions involved in inductive procedure. The *Essay on the Human Understanding*, which carries out in the domain of inner experience the practical tendency of the Baconian method, supplied from the point of view of individualism the metaphysical theory common to both, a certain psychological theory of the universal element in knowledge, and thereby afforded a new foundation for logical doctrines. The *Essay* contains, in an unsystematic fashion, much that bears directly on logic (*e. g.*, the whole discussion on names, the classification of the signification of judgments, the criticism of syllogistic argument), but of more importance than these detached and direct portions is the general principle which underlies the whole view of human knowledge. This principle is briefly that of psychological genesis. All the complex facts of knowledge are regarded as mechanical compounds due to the coherence of simple data, the facts of inner and outer sense. The method of Locke is that which underlies and determines all the logical work of one very important school of logicians.

It is not needful to enter into details of Locke's own contributions to the foundation of logic. But it may be pointed out that from his position there were two possible lines of development. In his view the primitive impressions, the facts of inner and outer sense, were in themselves primitive facts of cognition; they were cognitions (it is the very essence of Locke's method to identify a simple impression of sense with the knowledge of a simple sense

[1] His ultimate standard is, no doubt, necessity for a thinking subject. Whatever is so connected with the existence of the thinking being that without it this existence is incomprehensible is necessary. But to apply this ideal to any proposition save the first, the *Cogito ergo sum*, is for Descartes the fundamental difficulty of his philosophy.

[2] *Nov. Org.*, ii. 21. In addition to prerogative instances there are mentioned—supports of induction; rectification of induction; variation of the investigation according to the nature of the subject; prerogative natures; limits of investigation; application to practice; preparations for investigation; ascending and descending scale of axioms.

fact). The processes of abstraction, comparison, *i. e.*, judging and reasoning, were exercised upon their data, and these products were, in consequence, of a secondary and, so to speak, artificial character. It was natural that a thinker who identified impression of sense with knowledge of a sense fact should maintain that the secondary formations of thought (general ideas, general propositions, syllogism) were not indispensable for cognition; that we could and did reason from particulars to particulars. At the same time Locke admitted the secondary processes as having actual existence, and in one important case (that of the judgment of coexistence, with which may be taken the idea of substance and of real relation) seemed to allow that in judgment something was added to the primitive data. It was possible, then, for development from Locke's position to proceed either by offering an explanation of the added elements, which should be in stricter harmony with the fundamental doctrine of psychological genesis, or by throwing them entirely out of account and concentrating attention on the primitive data as the only materials of cognition. The first is the line taken by Hume, which finds its logical completion in Mill; the second is the line taken by Condillac.

Hume has an easy task so long as he merely subjects Locke's position to negative criticism; for the added elements, the ideas of substance, relation, cause, etc., are clearly inept and defenceless when the facts to be linked by them are already contemplated as so many completed, isolated cognitions. But where connectedness of cognition is in question, and where some explanation is demanded of the relations which seem to supply the universal rule in thinking, Hume's task is not so simple, and his final answer that these relations are psychological growths or products of association is neither satisfactory in itself nor quite in keeping with other portions of his doctrine. In Hume, however, we find the first thorough-going attempt to construct a theory of knowledge on the basis of psychological empiricism or individualism, and the first contributions to a doctrine of inductive proof as portion of this more comprehensive theory. Briefly, so far as logic is concerned, Hume offers as explanation of the universal in thought association of ideas, but does not treat of logic specially or in detail.

The complete statement of the theory of knowledge from the psychological point of view is that contained in Mill's *System of Logic*.

The aim of that work is the exposition of the theory of knowledge. Now knowledge, the term being taken in a wide sense, is characterized by one quality mainly, viz., evidentiary force. For every item entering into the sum of our beliefs at any moment, immediate perception being discounted, there may be reasons advanced, adequate or inadequate. The exposition of the relations between beliefs and their evidence or ground is logic, and logic is thus in one sense formal, inasmuch as the relations of evidence and belief are general, not dependent on the special nature of the facts believed, and in another sense real, in that knowledge is conceivable only in strictest relation to the things known.

Now, the exposition of the general nature of grounds of belief is in fact identical with a theory of the universal element in thought or cognition, and this theory is the essential portion of Mill's logic. It being assumed that the facts with which knowledge is concerned are minds, bodies, states of consciousness, and the relations (coexistence, sequence, similarity) among these states, and that propositions express, therefore, existence, coexistence, sequence, or resemblance, on what is based any inference going beyond a present perception? The propositions which make up cognition, strictly so called, are not mere expressions of momentary states; they are expressions of belief regarding the more or less constant relations of facts. They are, in fact, conclusions. The theory of proposition and of reasoning is one. On what, then, do such conclusions rest?

The warrant for any conclusion based upon experience, and referring to experience itself, can be found only in experience or in some principle furnished by experience. It may be shown that evidence for a conclusion is adequate, if we can compare this evidence with the kind of evidence on which a wider conclusion, frequently or constantly verified, rests. This comparison of particular evidence with more general evidence is the preliminary answer furnished by Mill. But what is the general evidence referred to, and what is the principle founded on it? The general evidence is the repeated experience of constancy of connection among groups of phenomena, and the principle founded on it is that of the existence of uniformity or rather of uniformities in nature. The evidence and the principle are purely psychological in character; that is to say, repeated experience, beginning with familiar cases and extending itself as time goes on, produces, by the natural laws of association, an assured belief that phenomena as a whole, or at least in the main, are connected together in constant, uniform, invariable modes. Such a belief, once established, serves as an ultimate criterion of proof, as an index for research. We proceed in our investigations in the light of this principle, and the tests by which we estimate the validity of evidence for any particular inference as to uniformity are generalized statements deducible from it. So soon as our evidence is of such a character that, in the case before us, either the inference of uniformity is warranted or the general principle must be held not to apply to this particular case, we have proof as cogent as experience can afford.

The universal in knowledge, then, is this naturally formed assumption regarding the course of nature. The logic of knowledge is the exposition of the modes in which evidence is obtained, of the tests by which its validity is estimated, and of the forms in which evidence and conclusion are connected.

The characteristic features of the subordinate processes of proof are at once deducible from this fundamental view. For if the simplest form of inference be, psychologically, the transition effected by association from one particular case to another resembling it, and if the essence of proof consist in comparison of the evidence for any one conclusion with the type of evidence for the general assumption regarding nature (or at least a wider portion of nature), it is evident that syllogism, in the ordinary acceptation of the term (in which it implies a concrete general proposition, a particular subsumed thereunder, and a conclusion), is neither a primitive form of inference nor a valid mode of proof. Doubtless we do in reasoning employ general propositions in order to express the determination of some particulars belonging to the same class, but the general proposition is itself a conclusion, resting on evidence of the kind above described, and the essence of syllogistic reasoning is not the subsumption of a particular under a general in which it is included, but the expression of belief that the evidence for the general proposition is adequate to cover all the particular cases, including those which have not been taken into account in formulating it. The major premiss of a syllogism is the record of a previous induction, and the syllogistic process, bringing forward a new case, is a valuable method for testing the adequacy of the previous generalization. As to generalization itself, the basis is evidently to be sought in experience, apprehended by observation and experiment. Did experience present to us isolated phenomena, *i. e.*, phenomena so arranged that enumeration of the elementary constituents, whether antecedents or consequents, were possible, then our inductive procedure must be regulated by those canons or axioms which express the kind of evidence already referred to as establishing uniformity. These canons or axioms, however, are, like the Baconian method of exclusion, tests for an ideally perfect experience, and they, therefore, only lie in the background of actual scientific procedure, which has to employ other processes, both of inference and of proof. For, if we can in no way obtain more than a knowledge of the coexistence of facts, we are unable to bring our evidence into conformity with the inductive canons, save in the ideal instance in which absolutely exhaustive experience both of positive and negative cases is possible. Inferences as to law or uniformity of coexistence must here be based on numerical calculation of probability, and the conclusions present themselves in the peculiar numerical form appropriate to propositions of probability. Further, if the phenomena under investigation be complex, so that the canons of neither observation nor experiment are immediately applicable, the process of investigation must of necessity be the combined method of analysis and synthesis: analysis, aided by hypothetical conjecture, formulating such general laws of elementary factors as are known or presumed to exist in the case in question; synthesis, combining these laws and calculating with greater or less numerical exactness, according to the nature of the matter, the probable combined effect,—the whole tested by critical comparison of the calculated result with the actual phenomena. Here, as one can see, syllogistic procedure appears in its true scientific aspect as the form of thought by which we pass from the simple to the more complex, from the elementary essence or cause to the complex accident or effect. The elementary causes, no doubt, have no more cogent evidence than that which can be afforded by experience viewed in the light of our psychological assumption of uniformities; nevertheless the whole procedure of scientific investigation is recognized as being essentially of the type sketched in somewhat imperfect outline by Aristotle.

So far, then, as the logic of Mill is concerned, and apart

from the undeniable richness and completness of knowledge with which the various processes are treated, we note but one fundamentally new feature, namely, the explanation offered of the universal element through which alone perceptions are raised into cognitions, through which alone reasoned knowledge is possible. It is the only explanation possible on the basis of psychological individualism; its value, and therefore the value of the systematic deductions from it, must depend on the accuracy and coherence of the psychological or metaphysical theory on which it is founded.

24. It was possible, however, to proceed by another route from the position taken up by Locke. If it be held that the elementary impressions, mechanically regarded as somehow arising in mind, are in themselves cognitions, then it is possible to view them as containing in themselves all possible cognition. In other words, we may confusedly identify the proposition that knowledge does not extend beyond the field of experience with the very different proposition that the only items of knowledge are the isolated impressions which appear to make up experience. If this identification be accepted (and the conception involved is precisely that underlying all consistent nominalism from Antisthenes downwards), then the only processes requiring to be taken into account are those whereby clearness and distinctness are introduced into our (possibly) vague perceptions. For these processes analysis is an adequate title. All knowledge, *i. e.*, whatever is characterized by clearness, definiteness, consequence, is the analysis of what is given in isolated perceptions. Each perception is itself and is only itself; no judgment is possible save that of identity. In other words, if there be judgment at all, it can consist only in the assertion that the unanalyzed perception is identical with that into which it is analyzed, and as each perception and each analytic portion of a perception may be signified by an arbitrary sign (name or other hieroglyphic), judgment is essentially an affair of naming, a declaration that different names are identical or belong to the same perception. Reasoning is simply the transition from one identity to another,—a more developed result of analysis. Scientific or real knowledge is an accurately framed system of signs, *i. e.*, a collocation of signs which expresses precisely the results of the analysis of complex perceptions. Logic, under this doctrine of knowledge, is merely a statement of the various modes in which analysis is carried out, of the ways in which names are applied, and of the forms in which names are combined. Such is the theory of logic presented by Condillac.[1]

Logic on the Basis of Metaphysical Psychology. Leibnitz and Herbart.

25. One development from the psychology of Locke has thus appeared as an extreme formalism, which, if carried out consistently, must needs assume the aspect of a numerical or mechanical system of computation.[2] It is remarkable that a very similar result was reached by Leibnitz, a thinker who proceeded from a quite opposed psychological conception. The similarity is due to the presence in both theories of a certain abstract principle, intimately though not necessarily connected with the respective psychologies. In place of the single perception which, in Condillac's logic, is the element to be analyzed, there appears in Leibnitz's view the single consciousness of the monad (see LEIBNITZ, p. 422); in both cases, however, knowledge is assumed to exist there implicitly and to stand in need only of evolution. The methods by which this evolution is to proceed form for Leibnitz the substance of a new and all-comprehensive science, "Scientia Generalis," of which the older logic is but a part.

The characteristics of Scientia Generalis are at once deducible from the two general principles which in Leibnitz's view dominate all our thinking,—the law of sufficient reason and the law of non-contradiction. It must contain a complete account of the modes in which from data conclusions are drawn, and in which from given facts data are inferred, and since the only logical relations are those of identity and non-contradiction, the forms of inference from or to data must be the general modes of combination of simple elementary facts which are possible under the law of non-contradiction. The statement of the data of any logical problem, and the description of the processes involved in combining them or in arriving at them, are much assisted by, if not dependent on, the employment of a general *characteristic* or symbolic art.

The fundamental divisions then of Scientia Generalis, so far at least as its groundwork are concerned (for Leibnitz sometimes includes under the one head all possible applications of the theory), are (1) the synthetical or combinatorial art, the theory of the processes by which from given facts complex results may be obtained (of these processes, which make up general *mathesis*, syllogistic and mathematical demonstration are special varieties); (2) the analytic or regressive art, which, starting from a complex fact, endeavors to attain knowledge of the data from whose combination it arose.[3]

Of the nature of the second portion only a few brief indications are contained in the logical tracts and in detached utterances in the larger works of Leibnitz. When complex combinations are presented, or, in the most general form, when the investigation has to start from experience, from truths of fact, the work of analysis is endless; the regress to conditions is practically infinite. Determination of the necessary data cannot in such a case possess more than probable value, but the probabilities may be estimated according to the rules laid down in the progressive or synthetic art.[4] The logic of probability is thus recognized as an integral portion of the logical system.

Of the first art, the logical calculus in particular, a somewhat clearer and fuller outline is given.[5] The logical calculus implies (1) the statement of data in their simplest form, (2) the assignment of the general laws under which combination of these data is possible, (3) the complete exposition of the forms of combination, (4) the employment of a definite set of symbols, both of data and of modes of combination, subject to symbolic laws arising from the laws under which combination is possible. In the *Fundamenta Calculi Ratiocinatoris* and the *Non-inelegans Specimen Demonstrandi*, something is effected towards filling up the first, second, and fourth of these rubrics, but in no case is the treatment exhaustive. The simple data, called characters or formulæ, are symbolized by letters, relations of data by a somewhat complicated and varying system of algebraic signs; for the calculus, or set of operations exercised upon relations given so as to produce new formulæ, no comprehensive system of symbols is adopted. Formulæ, relations, and operations take the place of notions, judgments, and syllogism. The general laws of combination of data are stated without much precision. Leibnitz recognizes the law of substitution, notes also what have been called the laws of reduplication and commutativeness, but, in actual realization of his method, employs indifferently the relation of containing and contained or the relation of identical substitution (æquipollence). No attempt is made to develop a complete scheme of possible modes of combination.[6]

At the root of Leibnitz's universal calculus, as of Condillac's method of analysis, and generally of nominalist logic, there lies a peculiar acceptation of the abstract law of identity. That a thing is what it is,—that knowledge of a thing is a single, indivisible, mechanical fact, susceptible only of explication or of expanded statement,—this is the principle dominating logical theories which in other respects may differ widely. Insistence upon this aspect of knowledge or of the object known is the ground for assigning to thought a function purely analytic, which is the very keynote of nominalism. It is not hard to see, however, that so to view the law of identity is to abstract from all the conditions of actual thinking and knowing, and to throw into the assumed simple fact all the complexity which is afterwards to be discovered in it by analysis. The knowledge of a thing is not to be explained in this abstract or mechanical fashion. Truth does not consist in the empty recognition that a is a, and in the repetition of this unimportant fact, but in the knowledge of the nature of a, a knowledge which essentially consists in relating a to its intellectual conditions, in assigning to it a place in the intelligible world. The identity of the thing with itself is a mere aspect of the complex process whereby the thing is cognized. It hardly requires to be pointed out that the minor forms of the same fundamental view, the various attempts to express the essence of a judgment as the assertion of identity, are open to the same objection. They take an abstract view of the

[2] Such as is hinted at by Hobbes, and as is carried out in the various works of Professor Jevons.

[3] Leibnitz sometimes includes these two under the head of "Ars Inveniendi," and places alongside of this, as first part of Scientia Generalis, "Ars Judicandi," a division resembling that appearing in Bacon; but the "Ars Judicandi" may be thrown out of account.

[4] *Op. Ph.*, pp 397, 398; *cf.* generally pp. 84, 93, 343.

[5] See specially *Op. Ph.*, pp. 92–114; also the tract "De Arte Combinatoria," *Op. Ph.*, pp. 6–45.

[6] It is interesting to note that Leibnitz signalizes the distinction between the logical and mathematical senses of a whole, and between the distributive and the collective meaning of quantity; that he emphasizes the function of the particular judgment as the negation of its opposed universal; and that he approximates to some modern modes of formulating the judgment (a is b, *e. g.*, he would express as $a = ab$, or ab is; no a is b, as ab is not).

judgment, and regard as the essential fact that which is but an accessory or adjunct or consequence. Difference, to put it in the briefest fashion, is no less essential to a judgment than identity.[1]

26. The view of logic put forward by Herbart, from a metaphysico-psychological basis resembling that of Leibnitz, agrees in so many respects with that of Leibnitz, although containing no reference to the idea of a logical calculus, that it may be placed under the same head. Logic, according to Herbart, is a purely formal doctrine; it has to do only with the modes by which clearness, distinctness, and system are introduced among our ideas. Logical forms, then, the notion, judgment, and syllogism, are not to be regarded as having any metaphysical reference; they are not even to be explained psychologically; they stand on their own footing as explanatory processes exercised about the representations which, under their own natural laws, fill up consciousness, coming and going within the sphere of apperception. According to this view the whole province of knowledge is excluded from logic, and it is assumed that knowledge is somehow given, mechanically, without the co-operation of processes, if not identical with, yet strongly resembling, those recognized as logical. Herbart does not succeed in vindicating an independent place for a purely formal logic.

The Kantian Logic.

27. The critical method, which has so influenced general philosophy that all later speculation refers more or less directly to it, has at the same time profoundly modified all later conceptions of the sphere and method of logic. From the Kantian philosophy there spring directly the three most important modern doctrines of logical theory,—that which, with many variations in detail, regards logic as a purely formal science, the science of the laws of thought or of the laws under which thought as such operates, and of the forms into which thought as such develops; that which, likewise with many variations, unites logical doctrines with a more general theory of knowledge; and finally that which identifies both logic in the narrower sense and theory of knowledge with an all-comprehensive metaphysic.

It is matter of history that the critical system was developed mainly from the basis of the Leibnitzian logical and metaphysical theories, and it is likewise matter of history that Kant, even in the speculative work which was to so large an extent antagonistic to these theories, remained under the influence of some of their cardinal possessions.[2] In particular the view of logical thought as purely discursive, analytic in character, a view never by Kant harmonized with his general system, is a relic, most significant for the development of his logic, from the Wolffian reproduction of Leibnitz's philosophy. This historic basis is not to be lost sight of in attempting to acquire a clear idea of the special place and function assigned by Kant to logical theory.

But a brief reference to the general result of the critical philosophy will suffice to introduce the more special treatment of the Kantian logic. Knowledge, or real cognition, which is analyzed in the *Kritik* in reference to its origin and validity, appears, when subjectively regarded, as a compound of intuition and thought, of sense and understanding. The isolated data of sense experience do not in themselves form parts of cognition, but are only cognized when related to the unity of the conscious subject, when the subject, as it may be put, has consciousness of them. This reflex act, resembling in some respects Leibnitz's apperception, or process of uniting in consciousness, is an act *sui generis*, not to be mechanically conceived or explained. Only through its means do representations become cognitions. The forms in which the synthetic act of understanding is carried out are, as opposed to the intuitive data on which they are exercised, discursive or logical in character. Essentially they are judgments: all acts of understanding are judgments, and, as judgments, they imply a general element with which the particular of sense is combined, and in the light of which the particular becomes intelligible. In ultimate analysis it appears that no particular, whatever be its empirical character, can become an intelligible fact save when determined through some specific act of understanding, through combination with some specific notion or general element. Combination of particular and general is thus the very essence of understanding, the mark of knowledge as such. In every item of cognition the same elements may be discerned as necessarily present. The consideration of the ultimate modes of intellectualization, of the series of acts by which understanding subsumes the particular, draws the particular into the unity of cognition, may be called in a large sense logic. If the consideration be specially directed to the mode in which, by means of this combination, knowledge arises, and therefore include discussion of the wide problem regarding the relation between understanding and objectivity in general (the matter of knowledge taken generally), the special title transcendental logic may be used. But if, concentrating attention solely on the kind of operation implied in understanding, we endeavor to lay out fully the modes in which understanding proceeds in the construction of knowledge, making abstraction of all inquiries regarding the origin, worth, significance of knowledge itself, the consideration is of a more general character, and may receive the title of general logic.[3]

The understanding, then, like everything else, works according to laws, the laws of its own nature. If we abstract from all that may characterize the matter considered, and take into account solely the laws according to which understanding must act, we may construct a purely formal doctrine, a theory which is rational both in matter and in form, for the matter consists of the laws of reason, and the form is prescribed by the very nature of reason,—a demonstrative theory, for nothing can enter therein which cannot be shown to have its ground in reason,—a complete theory, for although the matter of thought is infinite and infinitely varied, the modes in which the understanding must operate if unity of cognition is to result, are finite and capable of exhaustive statement,—and a theory developed from its own basis, standing in no need of psychology or metaphysics, but deducible from the mere idea of understanding as that which introduces unity into representations, whether given (empirical) or *a priori* (pure).

Were this the only determination of the province of logic given by Kant, the question which at once arises as to the possibility of any such independent doctrine would receive an easy solution. For it is evident that logic, as a theory of the form of thought, could consist only of a portion of the more general doctrine, by whatever title that be known, in which the nature of understanding as synthetic activity is unfolded. The distinction on which Kant lays stress between matter and form, a distinction employed by all subsequent writers of his school, is ambiguous and misleading. If by matter be meant the particular characteristics of the things thought about, in which sense we might speak of judgments of physical, chemical, grammatical matter, and so on, then to say that logic does not take this into account is perfectly inept. If logic be a philosophic discipline at all, a theory in any way concerned with thinking, it is at once evident that it can in no way deal with the specialties of any particular science. But this distinction between matter and form is by no means identical with another, lying in the background, and too frequently confused with the first,—the distinction of understanding as a faculty *per se* with its own laws, deducible from its mere notion, and understanding as the concrete real act of thinking. What Kant calls the mere idea of understanding, and what in other writers of his school appears as a definition of thought, is really nothing but a reference to what has presented itself in the wider inquiries of the *Kritik* as the complex nature of the synthetic activity of understanding. Kant himself never attempts to deduce from the notion of understanding the varied characteristics of logical forms, and his followers,—*e.g.*, Hamilton,—when they are consistent, start from concepts as expressing the bare notion of thought, and regard all other forms of thought as combinations of concepts.

But Kant does introduce another element into his treatment of the province of logic, one not original to him, but of the utmost importance for later developments from his point of view. He inquires what kind of relations among the elements of thought can form the matter of logical treatment, and defines these as two in number—(1) formal consequence, (2) non-contradictoriness. By formal consequence we are to understand the relation between a conclusion and its premisses, no inquiry being raised as to the truth or validity of the premisses. By non-contradictoriness we are to understand that, logically, notions, judgments, or reasonings can be subjected to treatment only in regard to the absence of explicit contradiction among the factors entering into them. Thought, which introduces

[1] Much of the confusion which reigns supreme in many modern works on logic is doubtless attributable to a confusion between the nature of the judgment and the result of a judgment. The result of a judgment is always an increased richness of the subject notion; the subject unqualified and the subject qualified by the predicate are doubtless identical; but it would be absurd to say, therefore, that the function of the judgment is the assertion of this identity.

[2] See article KANT, vol. xiii. pp. 859,862.

[3] It does not seem necessary to advert more in detail to the divisions and subdivisions of logic drawn out in the *Kritik*, pp. 86–93 (Hartenstein's ed., 1868).

unity and system into experience, must certainly introduce formal consequence and preserve analytic truth or correctness. Formal logic, then, treats only of these formal qualities of all products of thought.[1]

The detailed treatment of logic, so far as that can be gathered from the very brief summary (*Logik*, *Werke*, iii. 269–340), shows with the utmost clearness how impossible it was for Kant to deduce the forms and relations of thought from the mere notion of understanding, even when coupled with the principles of formal consistency and consequence. Assuming that understanding is the discursive faculty, the faculty of cognizing the many particulars through the one concept or notion, Kant deals first with concepts (Begriffe) as general or discursive representations. He is careful to avoid an error into which many of his followers have fallen, that of regarding Begriffe in a mechanical fashion as a specific kind of Vorstellung, distinguished only by containing a few of the marks making up the single intuitions. He rightly notes that cognition proceeds by subsuming the particulars under the common element contained in them, and that the generality of the concept thus rests upon the relation in which it stands, as reflective ground of cognition, to the particulars. The characteristics of concepts, as possessing extent and content, are treated briefly, after the fashion familiar in the more detailed logics of his school. It is, however, when the doctrine of judgment is reached that the difficulties of his position appear with greatest distinctness. Judgment is defined "as the representation of unity in the consciousness of distinct representations, or the representation of the relation of these, in so far as they make up a concept."[2] But the essential element in the definition—the unity of consciousness or unification of differences in a notion—is thus left so vague and undetermined that it is impossible to deduce from it any classification or any peculiarities of judgments, and possible indeed to proceed on two quite distinct lines of research. The expression, indeed, refers to that which is the fundamental fact in the critical system, the existence of conditions under which only it is possible for detached data of experience to become objects of knowledge for the single conscious subject; and, had Kant been true to the principles of his system, it would then have been necessary to base any classification and treatment of judgment on the enumeration of the functions of unity in conscious experience. In the *Kritik*[3] emphasis is laid upon the function of unity as the essence of the judgment, but it is a well-known historic fact that Kant makes no attempt to justify in its details the enumeration of such functions on which its divisions rest. His followers in the field of logic,[4] misconceiving the real relation of form to matter, interpreted the unity involved in the judgment as being a merely quantitative relation between given notions.[5] There is here involved a twofold error, which has exercised a most pernicious influence on the fortunes of logical theory. For, in the first place, so to view judgment is implicitly to proceed from the assumption of notions as given elements of knowledge, the relations of which are to be discovered by comparison or analysis of what is contained in them. The notion as empirically given thus becomes the fundamental fact; all other forms of thought, judgment, and syllogism are regarded as merely the mechanism by which the content of notions is evolved. Such a doctrine puts out of sight the peculiarities of the notion as the product of thought only, inevitably compels a distinction between what we may call the real processes of thinking whereby notions are formed and the elaborative processes by which notions when formed may be treated, and by regarding notions as simplest data, leads back to the old nominalist doctrine according to which all thinking is but the compounding and separating of simple elements.[6] And, in the second place, there is involved in all this the underlying prejudice, which it was the very business of the critical system to destroy, the attempt to treat knowledge, and thought, which is an integral part of knowledge, in a purely mechanical fashion. The Kantian analysis for the first time in the history of philosophy brought into clear light the essential peculiarity of knowledge, the reference of all the manifold details of experience to the unity of the thinking subject. Such reference, and the modes in which it expresses itself, are not to be conceived mechanically, nor can we regard the products of thought, the notion, judgment, and reasoning, in the same fashion in which, with but partial success, we treat, in psychology, the representations or reproductions in idea of actual fact. The essence of thought, the unity in difference of objects known and subject cognizing, is that which constitutes in its several modes the peculiarity of notions, judgments, and reasonings. The notion is simply the work of thought, looked at, if the expression be allowed, statically. There is no single psychical product, to be treated by the method of observation which is applied in psychology to sensations and ideas, which can be called the notion. Mental facts, which rightly or wrongly psychology deals with after its mechanical fashion, present themselves in a new aspect when they are regarded as parts, or rather as organic elements, in cognition. If we endeavor to apply the abstracting, isolating method of observation *ab extra* to them, doubtless only mechanical, abstract, and external relations will manifest themselves as obtaining among them, and there may thus be deduced a mass of abstract formulæ expressing relations of agreement and disagreement, total or partial coincidence, conflictiou, intersectiou, or co-existence and sequence, which have abstract truth, but are in no way adequate to express the genuine nature of thought.

Kant himself proceeds, as was said, by simply assuming, as somehow given, the cardinal forms of unity in consciousness, and distinguishing form of judgment from matter by the apparently simple difference between matters united and form of uniting, draws out the types of judgment under the familiar rubrics of quality, quantity, relation, and modality. The same assumption of distinctions only to be given by the higher researches of transcendental logic is manifested in his treatment of reasoning, the deduction of one judgment from others. Three main types of such deduction are signalized:—(1) deductions of the understanding, in which the conclusion follows simply from change in the form of the given judgment; (2) deductions of reason, in which the necessity of the deduced proposition is shown by reference to a general rule under which it falls; (3) deductions of judgment, in which the conclusion is reached by the treatment of given experience in reference to a general rule of reflection upon experience. Under the first of these fall the familiar forms of immediate inference; under the second, syllogism in its three varieties, categorical, hypothetical, and disjunctive; under the third, inductive and analogical reasoning. The understanding, if one may interpret Kant freely, is the process by which the worth of what is given is fixed and determined; it moves not beyond the given fact, and can therefore subject the fact to no other than formal transformation. The determining judgment or reason is the expression of the fundamental fact in knowledge that all experience is subject to general rules or conditions; there must therefore be a determination of the particular by the general; there must be ground for subsuming the particular and the universal. The forms of such subsumption and determination of the particular by the general are syllogisms. Syllogism therefore is the mode in which the essence of cognition is made explicit. The reflective judgment is the expression of the tendency to treat the contingent details of this or that given experience after the analogy of the general rule that all experience is subject

[1] Two at least of the followers of Kant have worked out the system of logic from this point of view,—the one, Twesten, in his *Logik, insbesondere die Analytik* (1825), the other, the late Professor Mansel, in his *Prolegomena Logica*. Mansel, recognizing the distinction between the two modes of determining formal logic, adopts the second, and is therefore led, in consistency, to define logic, not as the science of the laws and forms of thought, but as the science treating of formal thought, or of the formal element in the forms of thought. In other words, he recognizes that the statement of the forms of thought must be introduced into logic *ab extra*, from psychology or what not, and that logic, accepting these, has to consider the formal element (non-contradictoriness) in them. It is well to have the doctrine brought thus to its ultimate issue, for it is thence apparent that there is no independent science called logic, but simply one comprehensive precept, which may be called logical, viz., avoid contradictoriness in thought. Illustrations of the ways in which contradictoriness manifests itself may be offered, and a useful logical praxis may thus be afforded, but these do not make up a science or theory.

[2] *Logik*, § 17.

[3] *Analytik*, § 19.

[4] See specially the treatment of judgment by Esser (*Logik*, §§ 56 and 61), and Jakob (*Log. u. Met.*, §§ 189, 194, 201, 202), where the division of judgments into categorical, hypothetical, and disjunctive flows from a quite arbitrary and artificial principle.

[5] See Twesten, *Logik*, §§ 51–57, and 61; Hamilton, *Logic*, i. 230 *sq.* It may here be remarked that Hamilton's mode of translating the relative sections of Krug and Esser, his main authorities for the details of the Kantian logic, clearly shows that he did not attach any special significance to the phrase, unity of consciousness. In his view, the unity implied in the judgment A is B was the union of A and B in the notion of a given totality or whole—A being part of B in one aspect, B being part of A in another. This relation of whole and part is quite un-Kantian.

[6] It is by this course that the curious phenomenon of an algebraic or symbolic logic springing from the Kantian groundwork has come about. The same result follows, indeed, from any view of thought as merely exercised *about* facts which are already in themselves completed cognitions. Whether we call these notions (with Hamilton) or πρῶτα (with Antisthenes) or elementary data (with Leibnitz) or simple apprehensions (with the nominalists), the result is the same.

to intellectual determinations. This analogy does not necessitate the specific determination of the particular by any specific universal, but serves as general directrix in experiential researches. It is sufficiently evident that a remodelling of the older logical doctrine such as this rests upon a wider and more comprehensive philosophical view of knowledge as a whole, that such distinctions cannot flow from either of the principles previously indicated as those on which the formal conception of logic rested, and, finally, that the logical aspect of these distinctions is formal in the only true sense of that word, viz., in that the treatment is of necessity general, applicable to all or any thinking.

28. As in the Kantian system there were placed, side by side, two diverse conceptions of logical system, that of transcendental logic and that of formal logic, without any adequate link of connection between them, so from the Kantian position there diverged two quite distinct schools of logic, the transcendental or metaphysical, and the formal. As regards the second of these, but little requires to be said. The great body of logical treatises written from the Kantian formal point of view contain nothing of interest. In them the traditional logic is handled under the rubrics supplied by the Kantian general philosophy, with more or less of purifications from needless detail, according to the acuteness or insight of the writers, with more or less of deviation from the Kantian lines. In but few cases did the real difficulty, that of assigning to formal logic an independent plan and method, lead to a radically fresh treatment.[1]

The Kantian transcendental logic, being an analysis of the conditions under which objectivity in general becomes possible material for cognition, is in a special sense a new theory of thought. For thought is the process mediating the unity of the ego and the multifarious detail of actual experience; and only through thought, the universal, are objects so determined that they are possible matters of knowledge for a conscious subject. As determinations of objects, the pure elements of thought may be called notions, while the realization of notions in conscious experience is the judgment, wherein the universal of thought and the particular of sense are synthetically united, and the systematization of experience is the syllogism. Notion, judgment, and syllogism are thus, in the transcendental logic, no bare, abstract forms, but have as their content the pure determinations of objectivity in general. They cannot be conceived mechanically, as mere products differing only in degree of generality and abstractness from the ideas, and connections of association which appear as due merely to the psychological mechanism of the human consciousness. They are the essential forms of the ultimate synthesis through which knowledge becomes possible, and thus express in their organic system the very nature of thought, *i.e.*, of the thinking subject. In the Kantian doctrine, however, as it developed itself historically, there are various points of view which disturb the harmony of the system as thus sketched. Two in particular require special notice, as from these the later attempts at a complete revision of logical theory have taken their origin. (1) Throughout the Kantian work there appears a constant tendency to regard the ego, or central unity of self-consciousness, as merely abstract, as related mechanically, not organically, to the complex of experience in which its inner nature is unfolded. This tendency finds expression in various ways. Thus the synthesis, which has been shown to be the essential feature of cognition, is regarded as on its subjective side a union of intellectual function and receptivity of sense, and the contributions from either side are viewed as somehow complete in themselves.[2] Knowledge, in accordance with this, might be considered to be the mechanical result of the combination or coherence of the two, a combination which in the last resort must appear to the conscious subject as contingent or accidental. (2) Knowledge, the systematic union of universal and particular in experience, is thought as containing in some obscure fashion a reference to the most real world, the realm of things in themselves, and therefore as being, in antithesis thereto, strictly subjective. The processes of thought, by which unity is given to experience, thus manifest themselves as limited in scope, and as being the very ground or reason of the restriction of knowledge to phenomenal in opposition to noumenal reality.[3]

The presence of these two difficulties or perplexities in the Kantian system, which are, indeed, at bottom but one, led to revision of transcendental logic in two directions. The one line proceeded from the analysis of knowledge as the product of intellectual function and receptivity, and, uniting therewith metaphysical conceptions of varied kinds, culminated in a doctrine of cognition which, retaining the distinction between real and ideal as ultimate, endeavored to show that the forms of the ideal, *i.e.*, of thought, and the forms of reality were parallel. Logic, under this new conception, appeared as a comprehensive theory of knowledge, the systematic treatment of the modes in which thought, conditioned by its own nature and by the nature of the reality upon which it is exercised, develops into knowledge, *i.e.*, of the modes in which a representation of things characterized by universality and evidential force is obtained. On the whole this is the position assigned to logic by Schleiermacher, whose view is followed in essentials, though with many variations in detail, by a large and important school of logical writers.[4]

The second direction may be characterized generally as the attempt to develop fully what is involved in Kant's conception of thought as the essential factor of cognition. Any opposition between metaphysics as dealing with the real and logic as dealing with the ideal element in knowledge appears, in this view, as a mere effort of false abstraction. The very nature of reality is its nature in and for thought. The system of pure determinations of objectivity, which Kant had imperfectly sketched, is not to be regarded as a piece of subjective machinery, because it expresses the inmost conditions of intelligence as such. Nothing is more real than the ego, than intelligence or thought. Transcendental logic, or logic which is at the same time metaphysic, is the only discipline to which the title logic by right belongs. For it contains the complete system of the forms in and through which intelligence is realized. The notion, judgment, and syllogism are doubtless forms of thought, but they have their definite content. They are the modes in which the forms of objectivity are realized for intelligence, and are thus at once abstract and concrete. The so-called formal logic is a mere *caput mortuum*, a descriptive study of some few types of the application of thought to matters of experience. On the whole this is the view of logic developed through Fichte (and in part Schelling) by Hegel, and the Hegelian system shall here be regarded as its complete and only representative.

Logic as Theory of Knowledge.

29. The position assigned to logic as theory of knowledge and the range of problems included in it are determined by the general philosophic view of the distinction between the reality to be apprehended by thought and the subjective nature of thought itself. There may be, therefore, numberless variations in the mode of treating logic with general adherence to the one point of view.[5] In the *Dialektik* of Schleiermacher, for example, the fundamental characteristic is the attempt to unite some portions of the Kantian analysis of cognition with Spinozistic metaphysic. Knowledge is regarded as the complex combination of intellect, the formative, unifying, idealizing faculty, and organization or receptivity of sense. The generality or common validity of cognition rests on the uniform nature of organization and on the identity of all ideas in the one ideal system. The objective worth of cognition is referred on the one hand to the determined connection between the real universe and the organization through which the individual is part of the real order of things, on the other hand to the ultimate metaphysical parallelism between the system of ideas and reality. The primary forms of knowledge, notion, and judgment, distinct from one another only as being knowledge viewed now as stable now as in process, correspond to the ultimate elements of the real,

[1] Generally, the formal logician is compelled simply to take the processes of thought as determined in psychology or metaphysics or what not, and to consider certain aspects of them. His science has, therefore, no independent place, and no method of development. Independence may be striven after, either by attempting to develop all processes of thought and their logical peculiarities from an initial definition of thought solely, or by combining with this definition the view that non-contradictoriness is the one logical quality, and thus assigning to logic the discussion of the conditions of non-contradiction in thought. Of the first, Hamilton may be taken as the type; of the second, Twesten, Mansel, and Spalding.

[2] See vol. xiii. pp. 861,862.

[3] It is unnecessary to consider what exactly was Kant's teaching on either of these points, or what the significance of the relative doctrine may be in his system. It is sufficient, for the historical purpose in hand, to indicate the apparent tendency of his work, for from this the later developments take their rise.

[4] See, for an enumeration of the more prominent members, Ueberweg's *Logik*, § 34, a work which itself is an admirable exposition from the same point of view.

[5] It appears an historic error to identify the point of view here referred to with the Aristotelian. The notion of a parallelism between the forms of reality and the forms of knowledge is too definite to be covered by the mere expression, whether in Aristotle or in Plato, of the doctrine that knowledge is knowledge of being.

the permanent force or substance and its variable manifestations. Syllogism and induction, with the subordinate processes of definitiou and divisiou, analysis and synthesis, are technical modes of the development of notious and judgmeuts, modes by which inchoate notious are rendered definite, by which incomplete judgments are reudered complete.[1]

That there is much valuable and suggestive material in this mode of regarding logic is undoubted, aud in the discussion of isolated forms of knowledge, such as judgment, it is always desirablo that there should bo kept in mind the reference to the ultimato character of objectivity. But the whole point of view seems imperfect and open to such objections as will always preseut themselves when a principlo is not carried out to its full extent. It may, for propædeutic purposes, be desirable to separate the handling of logical forms from metaphysic, but such separation cannot be ultimate. Tho system of forms of reality to which the forms of knowledge arc assumed to correspoud must in some way enter into knowledge, aud they cannot enter in as an absolutely foreign ingredient, to which knowledge has simply to couform itself. For, if so, these metaphysical categories would bo discoverable only by an aualysis of concrete knowledge, and they would remain as inferences from the nature of cognition, not as data directly known. Tho cardinal difficulty which appears iu all treatments of logic from this point of view is that of explaining how there comes to bo known an objective system of things with characteristic forms or aspects, and it is not hard to see that tho acceptance of a reality so formed is but a relic of the pernicious abstraction which gave rise to the Kantian severance of knowledge from noumenal reality.[2] In short the position taken by Schleiermacher and his school, as final standing ground, is but an iutermediate stago in tho development of that which lay implicit in the critical philosophy.

Moreover, it is hardly possible to assumo this point of view without tending to fall back into that mechanical view of knowledge from which Kant had endeavored to freo philosophy. If there be assumed the severance botween real and ideal, it is hardly possible to avoid deduction of all that is characteristic of the ideal order from the observed or conjectured psychological peculiarities of inner experience. Tho real appears only as ultimato point of referenco, but in no other way determines the form of knowledge. The characteristic relations which givo content to notious, judgments, and syllogisms aro deduced psychologically.[3] In tho long run, it would no doubt be found that tho real key to tho position is the belief, more or less expressed, that tho systematic view of thought as comprehending and evolving the forms of reality is an unattainable ideal,—that metaphysic, to put it briefly, is impossible. To some extent this is the position taken by Lotze, whose cautious and ever thoughtful expositions are invariably directed to the elucidation of tho real *nodi*, the real roots of perploxity or iucompleteness of doctrine. In his view logical forms are tho modes in which thought works up tho material, supplied in inner experience by the psychological mechanism of tho soul, in conformity to tho ultimate presuppositions with the aid of which alone can harmony, or ethical and æsthetic completeness, bo gained for our conceptions of things. But with this doctrine, which approaches more clearly than any other of the type to the metaphysical logic, thero is coupled the reservo that any actual point of view from which the development of theso presuppositions, their rational explanation, might become possible is unattainable. Our confidence in them is finally of an ethical character, and depends upon our conviction of the ethical end or purpose of all the surroundings within which human life and character is manifested. In logic as in metaphysic we must content ourselves with more or less fragmentary treatment.[4]

Logic as Metaphysical.

30. To understand the peculiarities of this, the final conception of logic, we must take into account the ultimate view of knowledge as that in which thought and reality are united, and of philosophy generally as the attempt to develop the whole system of these abstract determinations of thought by which coherence and intelligibility are given to knowledge. In it there is carried out to the full exteut Kaut's idea of thought as the ultimate germ of intelligibility.

In tho critical system, as we have seen, the fundamental idea was continuously disturbed by the intrusion of doctrines which possessed significance only when the problems were treated from a quite opposed point of view. Thus the abstract separation of conscious experience, regulated accordiug to the conditions of the unity of thought, from a supposed realm of reality involved the consideration of the subject as one portiou or item of a mechanical whole. In other words, tho Kantian system proved itself unable to unite in a comprehensive fashion the two ideas of thought as tho uuiversal in experience aud of thought as the activity or mode of realization of the individual subject. The central point of view, that which refers all in experience to the unity of thought, was contiuuously departed from, and as a natural consequenco the various forms or modes of thought were treated, not in relation to their ultimate uuity, but as isolated facts, to bo dealt with by principles resting on a totally opposed doctrine. It is the esseuco of the Hegelian method to keep continuously in view the concrete unity and totality of thought, to treat each special aspect or determination as an integral portion of an organic whole, a portion which must prove itself unintelligible and contradictory if regarded apart from its relations to the whole, and so to avoid theso mechauical separatious and abstractions which had proved fatal to tho Kantian doctrine. In the development of a method which rests upon and endeavors to retain so comprehensive a point of view, there must of necessity bo much that is tentative and imperfect. Differences of opinion regarding the main stages in the development, regarding the particular content of auy ono stago, are quite compatible with adhesion to the general principlo of the whole.[5] But from this point of view only can justico be dono to those forms of thought which havo always been regarded as the special material of logical treatment; from any other, the treatment must be partial, fragmentary, and, so to speak, external. Thus, notion, judgment, and syllogism are not, in this view, treated as merely subjectivo modes in which the individual consciousness apprehends and works up tho material of experieuce, but as higher, moro developed, and thereforo richer forms of the determinations of thought in and through which intelligibility of experiencc is acquired. Tho whole system of these determiuations of thought, the categories, is tho matter of logic; tho realization of them in subjective experience, or the treatment of the successivo phases of consciousness in which abstract thought comes to be recognized in and by the individual, is tho matter of the philosophy of spirit, of which psychology is ono portion. Doubtless tho logical treatment may bo led up to by tracing the modes in which the full consciousness of tho determiuations of thought as the essence of reality is attained, but such introduction is propædeutic merely, and within the logical system itself tho starting-point must be the simplest, least definite of those categories whereby for spirit the realm of fact becomes intelligible.

The nature of tho opposition between this view and that of tho ordinary logic, which in tho main rests upon the principle of individualist psychology, that the content of knowledge is derived *ab extra*, from an entirely foreign world of fact, will becomo more clear if thero be considored specially the treatment which under the two methods is given to the notion. Notions, in ordinary logic, are regarded as products formed from the data supplied by preseutative and representativo experiencc, and tho mode of formation as geuerally conceived is a continuous process of critical comparison, recognition of differences, similarities, and grouping of liko facts. Not only, then, does the

[1] Perhaps the most complete treatment of logic from this point of view is that of George, *Logik als Wissenschaftslehre*, 1868. Ueberweg, dissenting from Schleiermacher's view of syllogism and the systematic processes of reasoning, lays out more fully what in his view are the aspects of reality corresponding to the typical forms of knowedge. Trendelenburg endeavors to fill up the gap between real and ideal by emphasizing the community of character between motion, as the ultimate reality, and constructiveness in knowledge, the central activity of the ideal.

[2] Thus we find in Schleiermacher (*Dial.*, §§ 132-34) that the ultimate difference of ideal and real is accepted as simple datum. In Ueberweg (*Logik*, § 8 and *passim*) there is continuous reference to an inner order of things, the forms of which are the metaphysical categories, but the actual treatment is altogether independent of these forms, and we may conjecture that, in the last resort, Ueberweg would have explained the characteristics of logical thinking by reference rather to the psychological mechanism than to a supposed nature of things (see *Logik*, §§ 40-42), and thus approximated to the position of Beneke rather than to that of Schleiermacher.

[3] This tendency, which appears in Schleiermacher and Ueberweg, and indeed in all the logics of that school (George's *Logik*, *e. g.*, is hardly to be distinguished from psychology), is prominent in Beneke. It is curious to note a precisely similar result in the logical theory of Mr. H. Spencer. Mr. Spencer supposes himself to be throughout referring to the nature of reality, but in fact all that is specific in the forms of reasoning developed by him is of psychological origin (see *Pr. of Psych.*, ii. §§ 302-9).

[4] Lotze's whole view of the genetic connection of the forms of thought is peculiar to himself, and deserves separate treatment.

[5] Hegel himself fully recognizes the tentative character of the numerous divisions and classification of tho categories of thought which make up the substance of the *Logik*, and desires that too much stress be not laid on the formal side of his exposition (see *Logik*, i. 29).

notion present itself as relatively poor and meagre in content, a kind of attenuated individual, not only are the only characteristics presented to the operation of thought mechanical and external, but the final product appears as a mere subjective abbreviation of what is given in experience. In the process, however, even as it is ordinarily conceived, there is more involved than is apparent on the surface. The individuals subjected to the abstracting and generalizing activity of thought are *qualified* individuals, *i. e.*, individuals viewed as determined in their own nature and in respect of thought by a whole network of relations, which when stated abstractly are really of the nature of categories. They are individuals only for a unifying intelligence which views them under diverse aspects, and these aspects are the blank forms of intelligibility, which it is the very function of logic to consider in system. Moreover, the purely formal acceptation of the notion as a mere mental hieroglyphic or sign stands in sharp contradiction to the view which as a rule accompanies it, and which, for the most part, receives explicit statement in a so-called applied logic or doctrine of method, that in the notion is contained the representation of the essence or truth of reality. It is impossible to retain with any consistency the merely arithmetical or numerical doctrine of the notion, as containing fewer marks than the individual, of the genus as characterized by a less number of attributes than the species, and so on. Underlying all genuine knowledge, all classification, and therefore all formation of notions, is the tendency towards the subordination of parts to a law which determines them. The generic attributes are not simply the points of agreement, but the determining characteristics, and the notion of a thing is the explicit recognition of its nature as a particular manifestation of a universal law.

Thus even within the limits of the ordinary logic there are problems which force upon it the reconsideration of the view which regards the notion as merely a mechanically formed psychical fact. Knowledge, no doubt, is only realized subjectively, in and through psychical facts, but the treatment of it in its nature as knowledge and the treatment of its psychical aspect are *toto genere* distinct. The metaphysical doctrine which keeps consistently in view thought as the essence of knowledge in its own nature has therefore to contemplate the notion in strictest relation to thought, as one mode in which objectivity as such is apprehended, made intelligible, and, in a very special sense, as the mode in which the nature of thought is made explicit. Thus the notion can only appear as uniting and comprehending under a new aspect these intellectual determinations whereby things are related to one another in a cognizable system.

The special characteristic of the Hegelian logic, the methodical principle of development of the determinations of thought, requires for its full elucidation a longer treatment than is compatible with the scope of a general sketch. But it seems necessary to add a word respecting certain difficulties or objections which apply, not specially to the methodical principle of Hegel's logic, but generally to the idea of a logic which is at the same time metaphysic or a treatment of ultimate notions. These objections may be variously put, according to the special point of view assumed by the critic, but they are in the long run dependent on one mode of interpretation of the fundamental antithesis between being, or reality, and thought. For whether we say that it is confusion to identify thought-forms with relations of fact, that it is unphilosophical to assume that being of necessity conforms to thought, that thought is purely subjective and knowledge the system of forms in and through which the subjective is brought after its own nature to an adequate representation of objective fact, or point to phenomena of perception as showing that even adequate correspondence, not to speak of identity, between subjective and objective must be matter of discussion, or lay stress upon the procedure of science as negativing the preliminary assumption of the logico-metaphysical assumption, we but express in varied ways a fundamental interpretation of the opposition between reality and knowledge. We assume an initial distinction, the grounds and precise nature of which are never made clear. For the antithesis between thought and reality is an antithesis in and by means of conscious experience, and is not to be comprehended save through conscious experience. If, indeed, we start with conscious experience as a mechanically formed *tertium quid*, something which arises out of the correlation of an unknown subject and an unknown object, we may certainly retain, as an ever-recurring and insoluble problem, the possibility of cognizing either factor *per se*. But the problem arises not from the antithesis but from our way of reading or interpreting it. Opposition between subjective thinking and the real world of fact, slow, tentative, and imperfect development in individual consciousness of knowledge which contains in essential relation the opposed elements, distinction therefore of the metaphysical or real categories which determine the nature of object as knowable from the ideal or logical categories which express more specifically the fashion in which the knowable object is reduced to the subjective form of cognition, are not only perfectly compatible with, but are strictly reasoned conclusions from, the ultimate doctrine that in thought alone is to be found the secret both of knowing and of being. To bring against this doctrine the continuous complaint that it assumes an identity which, if it can be proved at all, at least demands proof, is to misunderstand the very notion of identity which plays so important a part in the objection. Not even in the most judicious and thoughtful critics of metaphysical logic, in Lotze for example,[1] does one find a sufficiently careful distinction between a mere question of nomenclature (*i. e.*, whether we shall restrict the title *logic* to the portion of general system which deals with notions, judgments, and syllogism, while reserving for metaphysics all the other inquiries) and the question of theoretical importance, whether there remains over and above the difference between the more immediate determinations of thought and its more complex or reflective modes an essential difference in knowledge between thought and reality. In less careful critics the oversight simply leads to the contention that we shall always repeat the problem of knowing and being as insoluble, and shall view knowledge as a mechanical, subjective product.

Many of these objections doubtless result from a very simple fact, more than once alluded to in this article. Particular distinctions, apparently the most elementary, frequently involve and are unintelligible apart from a developed, though not necessarily consistent or well grounded, conception of things in general. Thus the emphasis laid upon thought as essentially subjective, as being merely the system of operations whereby the individual brings into order and coherence in his own experience what is furnished *ab extra* through the natural connection in which he is placed to the objective world, seems at first sight the most simple and direct consequence of the actually given distinction between the individual as one natural unit and the sum of things comprehending him and all others. But, on analyzing more closely the title for applying to philosophical problems a view which is that of practical life, and doubtless legitimate and necessary within that sphere, we readily become aware of a whole series of speculative assumptions implicit in that view, and possibly without any adequate justification. At all events, whether or not the view be ultimately defensible, and in the same form in which it is at first assumed, it is unphilosophical to start in the treatment of a difficult and important discussion from principles so ambiguous and undetermined. The practical difference between the individual agent and the external sphere within which his individual operations are realized, and which is therefore treated by him, from his point of view, as external, throws no light *per se* on the nature of the ultimate relation between the individual thinker as such and the world within which his thought is exercised. The confusion between ultimate distinctions and practical points of view is productive of most pernicious consequences not only in logic specially but in philosophy at large.

Criticism of the Chief Logical Schools.

31. It will probably be now apparent that determination of the nature, province, and method of logic is, and has always been, dependent on the conception formed as to the nature of knowledge. Discussions regarding the precise definitions of logic are not mere analytical disputes regarding the best mode of expressing in terms the nature of a subject sufficiently agreed upon; variations in the treatment of particular portions of logical discipline do not arise from more or less accurate discrimination of the nature and relations of given material; nor are differences in respect to the amount of logical matter to be considered mere expressions of difference as to the range of the same fundamental principles. The grounds for divergence are much more deeply seated, and, looking back upon the historical survey of the main conceptions of logical science, it seems quite impossible to hope that by comparison and selection certain common points of view or methods may be extracted, to which the title of logical might beyond dispute be applied. The logic, as one may call it, of each philosophical theory of knowledge is an integral part or necessary consequence of such theory; and its validity, whether in whole or in part, depends upon the completeness and coherence of the explanation of knowledge in general which forms

[1] See his *Logik* (1843), pp. 10, 11, and *Logik* (1874), bk. iii, chaps 4, 5.

the essence of that theory. Any criticism of a general conception of logic, or special application thereof, which does not rest upon criticism of the theory of knowledge implied in it must be inept and useless. It is not possible to include such expanded criticism in an article like the present; there remains therefore only one aspect of these various logical schemes which may be subjected to special and isolated examination, viz., the inner coherence of each scheme as presented by its author. Naturally such an examination can be applied only to views which imply the separate existence of logic as a body of doctrine developing into system from its own peculiar principles. When it is a fundamental position that logic as such has no separate existence, but is one with the all-comprehensive doctrine or theory of the ultimate nature of cognition, it is not possible to criticise such conception of logic separately; criticism of logic then becomes criticism of the whole philosophical system. In most of the views brought before us, however, a special place has been assigned to logic; it is therefore possible to apply internal criticism to the more important of these general views, and to consider how far the pretensions of logic to an independent position and method are substantiated.

From the foregoing remarks it will also have become apparent that a general classification of logical schools, as opposed to the reference of these to ultimate distinctions of philosophical theory, is impossible. A distribution into formal (subjective), real (empirical, or, as certain German authorities designate it, *Erkenntnisstheoretisch*), and metaphysical conceptions of logic is rather confusing than helpful. For the formal logics of the Kantian writers, of Hamilton and of Mansel, are distinct, not only from one another, but from such equally formal logics as those of Hobbes, Condillac, Leibnitz, Herbart, Ulrici, Boole, De Morgan, and Jevons. Logic as theory of knowledge presents quite special features when handled by Mill, or by Schleiermacher, Ueberweg, Beneke, and Wundt. And it cannot even be admitted that the threefold classification affords room, without violence, for the Aristotelian logical researches. There are no points of agreement and difference so unambiguous that by their aid a division can be effected.[1]

32. Few conceptions of logic contain, with so little real ground, such professions of completeness and independence as that developed in the writings of the Kantian school.[2] According to this view, logic is a pure science, having as its special material the form of thought, demonstrative in character and with theorems capable of complete deduction from the elementary principles contained in the very notion of form as opposed to matter of thought. But when one comes to the examination of the system itself, one finds (*a*) that the notions of form and matter are much too stubborn to lend themselves readily to analysis, and that explanations of what exactly constitutes form fluctuate between a merely negative definition (whatever is not treated in any other science, philosophical or otherwise) and a psychological deduction from the assumed nature of thought;[3] (*b*) that the really important factor in determining the contents of logical science is psychology, from which much more is borrowed than the mere preliminary definition of thought; (*c*) that demonstrative character rests entirely on an abstract interpretation of the laws of identity and non-contradiction; (*d*) that throughout the whole system there is not a trace of development, but merely the reiterated application of the law of identity and contradiction, or of some confused distinction between form and matter, to logical products, the notion, judgment, and syllogism, whose nature, characteristics, and distribution are arbitrarily excepted from psychology or general criticism or what not. Thus, in the majority of cases, logicians who simply followed the lines indicated by Kant introduced into their system, without any criticism, the fundamenal distinctions contained in the *Kritik d. reinen Vernunft*. The fourfold scheme of quantity, quality, relation and modality was applied without hesitation, though in varied and always artificial fashion, to notions;[4] judgments were accepted as being categorical, hypothetical, and disjunctive in kind, though the differences are altogether foreign to the logical principle applied; and generally no attempt was made to do more than treat in an abstract fashion some aspects of a procedure of thought determined in all its phases by extra-logical considerations. The inevitable result of such a treatment was the undue preponderance given to the doctrine of notions, which, being viewed after the fashion of Kant as given, completed products, appeared as the ultimate units of thought, to be combined, separated, and grouped together in all the higher processes. The peculiarities of the logical system which is commonly associated with the name of Sir W. Hamilton spring entirely from this view of notions. For, if notions be regarded as the elements of thought, then the judgment which elaborates them can only present itself as the explicit statement of immediate relations discernible among notions. These immediate relations reduce themselves, for Hamilton, to one,—the quantitative relation of whole and part,—and, attention being concentrated on the extensive reference of concepts, the eightfold scheme of propositional forms is the natural consequence. To such a scheme the objections are manifold. It is neither coherent in itself, nor expressive of the nature of thinking, nor deduced truly from the general principle of the Hamiltonian logic. For it ought to have been kept in mind that extension is but an aspect of the notion, not a separable fact upon which the logical processes of elaboration are to be directed. It is, moreover, sufficiently clear that the relation of whole and part is far from exhausting or even adequately representing the relations in which things become for intelligence matters of cognition, and it is further evident that the procedure by which types of judgment are distinguished according to the total or partial reference to extension contained in them assumes a stage and amount of knowledge which is really the completed result of cognition, not that with which it starts, or by which it proceeds.[5]

The utility of basing logical theorems on psychological premisses, a method involved in the procedure of most expositions of formal logic, may well be matter of doubt. For psychology, as ordinarily conceived, has certainly close relations with logic, but in aim and in point of view is distinctly opposed or at all events subordinate to it. The psychological investigation of thought, if carried out consistently, must take one of two forms, either that of description, in which thought, like any other mental fact, is regarded *ab extra* as that upon which attention and observation are to be directed,—in which case therefore any relations of thoughts among themselves must be of such an external nature as can be presented in the field of observation; or that of genesis, development, in which the subjective processes of mind are viewed as forms of the one great process whereby knowledge is realized in the individual consciousness. Investigations from the first point of view are diametrically opposed to the logical treatment of thought, for in the latter the essential feature, the reference in the subject, with his mental forms, to an objective order within his experience is entirely wanting. Such investigation is abstract; it proceeds upon and remains within the limits of a distinction drawn in and for conscious experience, a distinction the grounds, significance, and modes of which require to be treated by a larger and more comprehensive method. Investigations from the second point of view are subordinate to logic in the wider sense, for the treatment of the subjective processes therein is illuminated and determined by the general principles regarding the nature and meaning of conscious experience which it is the sole function of logic to bring forward and establish. The psychology which Hamilton generally has in view is that commonly called empirical, and with his conception of it the two sciences, logic and psychology, are really one.

33. A possible exit from the difficulties or assumptions of the current Kantian logic may be sought by following out and consistently applying the hint contained in Kant's distinction of analytic and synthetic thought, analytic and synthetic truth. It may be said that all thinking involves the fundamental laws of identity and non-contradiction; that in these laws only is to be found the characteristic and most general feature of thought; that in them only is the form, or element contributed by mind itself, to be detected. Logic would thus be regarded as the explicit statement of the conditions of non-contradictoriness in thought, as the evolution of the formal element in thought, and, since in analytic truth only can non-contradictoriness be discovered without material aid, as the theory of analytic

[1] Nor are more detailed classifications, such as those of Rosenkranz (*Die Modificationen der Logik*, 1842), Prantl (*Die Bedeutung der Logik*, 1849), Rabus (*Neueste Bestrebungen*, 1880), of service, except when historical.

[2] Under this head Kant himself, for reasons above given, is not included; the writers referred to are named in Ueberweg (*Logik*, § 34).

[3] Mill's criticism on Hamilton's confused statements regarding forms (*Exam. of Hamilton*, 438–454), is perfectly applicable to the generality of the Kantian treatises on logic.

[4] See, *e. g.*, Krug, *Logik*, § 25 *sq. v.*

[5] The extension of a notion has no numerical or quantitative definiteness. To formulate the judgment as expressing definite amounts of extension, therefore, presupposes complete empirical survey of what, by its very essence, remains incomplete. This is specially noteworthy in the case of Hamilton's particular judgments. A judgment such as *only some A is all B* assumes total and perfect knowledge of the whole spheres of A and B. It is in the strictest sense of the word *universal*. Hamilton, it may be added, finds it completely impossible to work out a coherent doctrine of syllogism from the point of view taken in the treatment of the judgment.

thought. Such is the position assigned to logic by Twesten, Mansel, Spalding, and some others, and the consequences to which it inevitably leads are sufficiently interesting to require that some special examination should be given to it.

In the first place, then, it seems evident that the fundamental distinction implied, that between analytic and synthetic thought, is wrongly conceived. That analysis and synthesis are methods of cognition, differing in many important respects, is undoubted; but such difference lies in a sphere altogether alien to that within which the present distinction is to be sought. Analytic thought, as here conceived, is only to be understood when taken in reference to the judgment, and then also in reference to a peculiarity in the Kantian doctrine. Kant, emphasizing the principle that judgment is essentially the form in which the particular of experience is determined by the universal element of thought, but identifying this universal with a formed concept (resembling, therefore, a class notion), contemplated a class of judgments in which the predicate was merely an explication of the subject notion. Such judgments, had the matter been more fully considered, would have appeared as far from primary, and Kant has himself, in the most unambiguous language, indicated the correct view that analysis is consequent and dependent on synthesis,—that analytic judgments, therefore, are merely special applications of abstracting thought within a sphere already treated, handled, formed by thought. Mansel, too, whose views are generally acute if not profound, has signalized as the primitive unit of cognition the so-called psychological judgment, which is essentially synthetic in character. The logical judgment, in fact, about which his conception of logic centres, is recognized as a posterior act of reflection, directed upon formed notions, and is not in any way to be regarded as containing what is a common, universal feature of all judgments.

In the second place, even granting what cannot be maintained, that the process of thought is mere explication of the content of previous knowledge, and that the theory of logic has to do with a comparatively small and subordinate portion of cognition, there is in such a principle no means of development. We may take up in succession class-notions, judgments, reasonings, and in relation to each reiterate, as the one axiom of logic, that the constituent elements shall be non-contradictory; but such a treatment is only possible in relation to a material already formed and organized. The utmost possible value being given to such a view, logic, under it, could be but a partial and inchoate doctrine.

Finally, there is involved in the doctrine of analytic thought, and in the consequences to which attention will next be drawn, a peculiar and one-sided conception of identity or of the principle of identity as an element in thought. Historically this conception has played a most important part: it lies at the root of all nominalist logic from Antisthenes downwards, and has found metaphysical expression of the most diverse kinds. *That things are what they are* is the odd fashion in which a well-nigh forgotten English writer states what is taken to be the universal foundation of all thought and knowledge.[1] The representatives of things in our subjective experience, the units of knowledge, may be called notions, and, accordingly, that each notion should be what it is appears as the corresponding logical axiom. The whole process of thought is therefore regarded as merely the explicit statement of what each notion is, and the separation of it by direct or indirect methods from all that it is not. The judgment, essentially the active movement of thought, is reduced to the mere expression of the identity of a notion, and in truth, were the doctrine consistently carried out, Antisthenes's conclusion that the judgment is a fallacious and inept form of thought would be the necessary result. When such a conclusion is not drawn, its place is generally taken by much vague declamation regarding the limited, imperfect, and uncertain character of our knowledge, which is regarded as asymptotically approaching to the adequate determination of truth.

The conception which underlies this view is the abstract separation of thought from things which has been already noted, but the proximate principle is a deduction therefrom. Knowledge or thought is treated externally as a series of isolated units or parts, and the results of cognition —notions, judgments, and reasonings—are viewed as the constituent factors. Thus, *e. g.*, when it is said that a judgment is the expression of an identity, there are possible only two modes of explanation,—the one, that the identity referred to is that between the original notion (subject) as unqualified by its predicates and the same as qualified, in which case manifestly the result of the judgment is taken as being its constituent essence; the other, that the identity is that of the applicability of distinct names to the same fact, in which case we accept without further inquiry and exclude from logical consideration the processes of thought by which the application of names is brought about, and assume as being the procedure of thought itself that which is its consequence. Under all circumstances, difference is as important an element as identity in the judgment, and to concentrate attention upon the identity is to take a one-sided and imperfect view.[2]

34. So soon, however, as the real nature of thought has been thrown out of account as not concerned in the processes of logic, so soon as the law of non-contradiction, in its manifold statement, has been formulated as the one principle of logical or formal thinking, there appears the possibility of evolving an exact system of the conditions of non-contradictoriness. The ultimate units of knowledge, whatsoever we call them, whether notions or ideas of classes or names, have at least one characteristic,—they are what they are, and therefore exclude from themselves whatever is contradictory of their nature. They are combined positions and negations, that which is posited or negated being left undetermined,—referred, in fact, to matter as opposed to form. With respect to any article of thought, therefore, the only logical requirement is that it shall possess the characteristic of not being self-contradictory, and the only logical question is, what exactly is posited and negated thereby. Complex articles of thought viewed in like manner as complexes of positions and negations may have the same condition demanded of them and the same question put regarding them. A judgment and a syllogism, if narrowly investigated, will appear to be merely complex articles of thought, complexes of positions and negations. Proceeding from such a conception there may be treatments more or less systematic and fruitful. In the hands of Kantian logicians, such as Twesten, Mansel, Spalding, and the like, little is effected, for, as the forms of thought are accepted as given and as having their characteristics otherwise fixed (by psychology or critical theory of knowledge), the treatment resolves itself either into repetition, in respect to each, of the fundamental logical condition, or into the erection of a specific kind of thought (analytical) which has no other feature save that of correspondence with the said condition. But it is clear that restriction by any psychological or critical doctrine of thought is an arbitrary limitation. It is needful only to regard the operation of thought as establishment of positions and negations, and to develop, by whatever method, the systematic results of such a view. Hobbes's doctrine of thought as dealing with names and as essentially addition and subtraction of namable features, Boole's doctrine of thought as the determination of a class, Jevons's view of thought as simple apprehension of qualities,—any of these will serve as starting-point, for in all of them the fruitful element is the same. The further step that the generalization of the system of thought must take a symbolic form presents itself as an immediate and natural consequence.

35. By the application of a symbolic method is not to be understood what has been practised by many writers on logic—the illustration of elementary logical relations by numerical or algebraic signs or by diagrammatic schemata. The expression has the signification which it bears in mathematical analysis, and implies that the general relations of dependence among objects of thought, of whatsoever kind, in correspondence with which operations of perfectly general character are carried out, shall be represented by symbols, the laws of which are determined by the nature of these relations or by the laws of the corresponding operations. The mere use of abbreviations for the objects of treatment is not the application of a symbolic method;[3] but so soon as the general relations of, or general operations with, these objects are represented by symbols, and the laws of such symbols stated as deductions therefrom, there arises the possibility of a symbolic development or method of treatment, which may lead to more or less expanded results according as the significance of the sym-

[1] John Sergeant. See *The Method to Science*, by J. S., 8vo, Lond., 1696, pp. 144, 145. This curious book contains much interesting matter.

[2] On Condillac's attempt to treat judgments as identities (or equations) some excellent remarks will be found in De Tracy, *Idéologie*, iii. 133–143, *cf.* Duhamel, *Des Méthodes*, i. 89–94.

[3] Thus one would not describe Aristotle's use of letters for the terms of his syllogisms, nor the current logical abbreviations of S, P, and M in like case, as being, in any true sense of the word, symbolic. On the subject generally, the instructive work of Mr. Venn (*Symbolic Logic*, 1881) should be consulted. Mr. Venn has not only in this work expounded the foundations and main theorems of Boole's logic with a care and skill that leave nothing to be desired, but he has, independently of many real contributions to logical analysis, put in its true light the nature of symbolic method in logic. He has rendered it impossible, even for the outsider, to complain that symbolic logic is an arbitrary application of mathematical method to logical material.

bolic laws is more or less general. Thus quantity, whether discrete or continuous, presents, as an aspect of phenomena, relations of a highly general kind, offers itself as object of operations of a highly general kind, and is therefore peculiarly the subject of symbolic treatment. Currently, indeed, the treatment of quantity is assumed to have the monopoly of symbolism, but such an assumption is not self-evidently true, and it is permissible to inquire whether matters non-quantitative do not present relations of such generality that they, too, can be symbolically dealt with. It is, however, a further question whether the generality of the relations and therefore the significance of the symbols in such cases, although subject to some special conditions not necessarily involved in the nature of quantity, do not spring from the fact that we treat the matters as quantities of a special kind, and so insensibly find ourselves applying quantitative methods. In other words, it remains to be investigated, after the preliminary definitions and axioms of any symbolic method have been laid down, whether the conception of thought with which we start, or a special feature distinctly quantitative in character, has been the truly fruitful element in after-development of the system.[1]

The first step in any symbolic logic must evidently be the determination of the nature and laws of the symbols, and, as these follow from the nature of the operations of thought, the first step is likewise a statement of the essential characteristic of thinking. As above noted, there have been adopted various modes of expressing this characteristic, and in some cases the mode adopted is not one from which any generally applicable symbolic rules of procedure could have followed.[2] Two only require here to be noted, as representing special views: first, that which proceeds from the idea of thought as essentially the process of grouping, classing, determining a definite set of objects by a mark or notion; and second, that which proceeds more generally from the conception of thought as consisting of a series of self-identical units, to be variously combined in obedience to the law of self-identity.[3] Adopting the first view, we find that processes capable of symbolic representation, by the customary algebraic signs of addition, subtraction, equivalence, multiplication, and division, have a perfectly general significance in reference to the combination, separation, equalization of classes, to the imposition and removal of restriction on a class; that to the symbols there can therefore be assigned a set of general laws; and that any peculiarity of the symbolic laws which differentiates them from the laws of like symbols in mathematical analysis is deducible from the notion of thought with which we started, and is consequently to be carried along with them in all the after development. Symbolic representation of relations of classes follows with equal directness from the general notion that by any such relation a new group is determined in reference to the original groups, or rather that the position or negation of a new group (or series of groups) is given, definitely or indefinitely, as the result of such a relation.

With the aid of the symbolic laws so reached, the logical problem as such may then be approached. Given any number of logical terms (*i. e.*, classes, or, as it may be better put, positions and negations) connected together by any relations, to determine completely any one in reference to the others, or to express any one in terms of the others. The symbolic procedure, expounded with marvellous ingenuity and success by Boole, may take various forms, and may be simplified by many analytical devices, but consists essentially in determining systematically how given positions and negations, definite or indefinite, combine with or neutralize one another. A more detailed account of these formal processes is beyond our limits.[4]

The first question which suggests itself in connection with Boole's symbolic logic is the necessity or advisability of retaining the reference to classes, or the description of thought as classification. Do the symbolic laws really depend to any extent on the logical peculiarities of class arrangement? Mr. Venn, who emphasizes this feature in Boole's scheme, has, however, done good service in leading up to a different explanation. The general reference to objects, which is also noted as implied in all Boole's formulæ, has nothing to do with the possible difference of conceptualist or materialist doctrines of the proposition, and, in fact, as all distinctions of thing and quality, resemblance and difference, higher and lower, subject and predicate vanish, or are absorbed in the more general principle underlying the symbolic method, phrases such as classification, extension, intension, and the like should be banished as not pertinent. Nay, the usual distinctions of quantity and even of quality either disappear or acquire a new significance when they are brought under the scope of the new principle. "What symbolic logic works upon by preference is a system of dichotomy, of x and not x, y and not y, and so forth."[5] In other words, quantitative differences require to find expression through some combination of the positions and negations of the elements making up the objects dealt with,[6] while the usual qualitative distinctions are merged in the position or negation of various combinations.

The whole phraseology then of classification and its allied processes seems needless when used to denote the simple determination of objects thought. The literal signs express, not "classes," but units, determined in and for thought as self-identical. For this reason then it appears that the view of the foundations of the symbolic methods of logic taken in Grassmann's *Begriffslehre* is more thoroughgoing, and more closely represents the underlying principles, than that involved in Boole's formulæ and expounded in detail by Mr. Venn.

Grassmann, as above stated, deduces logical relations as a particular class of the determinations necessarily attaching to all quantities (*i. e.*, determined contents of thought). Abstraction being made of all peculiarities which may be due to their special constitution, quantities exhibit certain formal relations when they are combined (added, subtracted, etc.). Each quantity is a unit of thought, a definite *positum*, and of such units there are but two classes, elements and complexes. Units of thought, which are self-identical, and therefore subject to the specific law that addition of each to itself or multiplication of it by itself yields as result only the original unit, are notions. The theory of notions, therefore, is the development of the general formal relations of units under the special restrictions imposed by their nature.[7]

There appears very clearly in Grassmann's treatment the essence of the principle on which symbolic logic proceeds Thought is viewed as simply the process of positing and negating definite contents or units, and the operations of logic become methods for rendering explicit that which is in each case posited or negated. To apply symbolic methods, we require units as definite as those of quantitative science, and the only laws we can employ are those which spring from the nature of units as definite. Now it seems a profound error to reduce the whole complex process of thinking to this reiterated position of self-identical units. Undoubtedly if we start from any given fact of thought, as, *e. g.*, a judgment, and inquire what can be exhibited as involved in it, we have before us a problem of analysis, the solution of which must take form in a series of positions and negations, but our thinking is not therefore as a whole mere analysis. The synthetic process by which connections of thought among the objects of our conscious experience are established is not the mechanical aggregation of elementary parts. The relations which give intelligible significance to our experience are not simply those of identity and non-identity. It is an altogether abstract and external view of thought, resting in all probability on an obscure metaphysical principle,[8] that would treat it as in essence the composition and decomposition of elementary atoms, of πρῶτα, as Antisthenes would have called them. It has, indeed, been imagined that a symbolic logic might be developed which should be independent in all its fundamental axioms of any metaphysical or psychological assumptions, but this is an illusion. No logical method can be developed save from a most definite conception of the essential nature and *modus operandi* of thinking, and any system of symbolic logic finds it necessary, if it is to be complete and consistent, to adopt some such view as that above criticised, to regard thought as purely analytic, as dealing with compounds or units which are themselves highly complex products, only to be formed by a kind of thought not recognized among logical processes.[9]

36. Formal logic, then, in the ordinary acceptation of

[1] An excellent note on symbolic logic will be found in Lotze, *Logik* (2d ed., 1880), pp. 256–59.

[2] Some of these, as, *e. g.*, Lambert's and Ploucquet's are noted and discussed by Mr. Venn (*Symbolic Logic*, xxxii.-xxxvi. and *passim*).

[3] The first is the view taken by Boole (and expounded with great fulness in Venn, as above); the second is that of the brothers Grassmann (in the *Formenlehre*, 1872, especially bk. ii., *Die Begriffslehre oder Logik*).

[4] Mr. Venn's work is here again invaluable. Jevons's *Principles of Science* and *Studies in Deductive Logic* should be consulted. Schröder's *Operationskreis des Logikkalculs* contains some very elegant and simple methods.

[5] Venn, as above, p. 162.

[6] Where this is impossible, as in the case of the truly particular or indeterminate judgment, symbolic methods encounter almost insurmountable difficulties.

[7] See *Die Begriffslehre oder Logik* (1872), p. 43. Schröder (*op. cit.*) follows Grassmann, though with the use of *class* phraseology.

[8] As above noted, p. 808.

[9] The same fact has been noted in regard to formal logic of the Kantian school, as *c. g.*, in Mansel's distinction of psychological and logical judgments.

that term, does not appear to furnish any adequate representation of the real process and method of thought, Any logical theory must of necessity be formal, *i. e.*, abstract or general, for it can consider only the general elements of thought, not specific knowledge in which are involved the finite, limited relations of one fact or class of facts to another. The distinction between logic and the sciences is therefore precisely that between philosophy in general and the sciences. Attempts have been made to include in logical analysis the treatment of scientific method, *i. e.*, to discuss as matter of logic the varied processes by which scientific results have been attained. It is true that logical consideration must extend to the notions through which scientific experience, like any other, becomes intelligible, and, in so far as scientific method is but the application of the laws of knowledge as a whole, it is a possible, nay necessary, object of logical treatment. But to include scientific methodology in particular, the consideration of the mechanical devices by which we strive to bring experience into conformity with our ideal of cognition, the discussion of methods of experiment and observation, under the one head logic is an error in principle, whether we view logic in its theoretical aspect or in reference to a special propædeutic aim. Generalizations on such topics are well-nigh worthless; they can have vitality and importance only when drawn in closest conjunction with actual scientific work. The theory of scientific method is either doctrine of knowledge treated freely or else the application of thought in connection with actual research and the ascertainment of the principles therein employed. In either case it is not susceptible of abstraction and isolated treatment.

37. There remains only, of the possible views noted, that which identified logic with the theory of knowledge, but which so defined theory of knowledge as to distinguish it from metaphysics. The designation of logic as theory of knowledge is one to which in words there can be no possible objection. It brings into the foreground what it has been the object of this article, by an historico-critical survey, to establish, that so-called logical laws, forms, and problems are hardly capable of statement, certainly incapable of satisfactory treatment, except in the most intimate connection with the principles of a theory of knowledge. To include, however, in the signification of this latter term a peculiar conception of the relation between thinking (knowing) and reality is at once to restrict the scope of logic and to place an arbitrary and, one would say, an ill-founded restriction on the kind of treatment to which logical problems may be subjected. If it be really the function of logic to trace the forms and laws of knowledge, that function is all-comprehensive, and must embrace in its scope all the fundamental characteristics of experience as known. But no characteristic of experience is more palpable than the distinction, drawn within conscious experience, between knowledge and reality. It is impossible then for a theory of knowledge to start with the assumption that these two exist separately, constituted each after its special fashion, but with a certain parallelism between them. In words one may refer for justification of the assumption to metaphysics, or to psychology, but, in fact, the problem so relegated to some other discipline is essentially a logical question, and the method of its solution exactly that which must be applied in the treatment of subordinate logical questions. Practical convenience alone can lead to any separation of the problems which under this view are referred in part to theory of knowledge and in part to metaphysics. Other and more serious difficulties of the view have been already commented on.[1]

38. In sum, then, the problems and the methods which compose logic in the strictest sense of that term seem to be one with the problems and methods of the critical theory of knowledge. No other title describes so appropriately as that of "logical" the analysis of knowledge as such, its significance and constitution, in opposition to the quasi-historical or genetic account for which the title psychological should be retained. The researches to which we would here assign the title "logical" undoubtedly include all that can supply the place of the older metaphysic, but in aim and method are so distinct that the same title cannot be borne by both. To assign so extensive a range to logical investigations enables us to see that the criteria by which at one time or another a narrower province was determined for logic are but partial expressions of the whole truth. The analysis of knowledge as such, the complete theory of the intelligible elements in conscious experience, does hold a special relation to all other subordinate branches of human thinking, whether philosophic in the ordinary sense of that term or scientific. According as one or other aspect of this relation is made prominent there comes forward one or other of the various modes for settling the province of logic; but these partial conceptions prove their inadequacy when development is attempted from them, and within the systems constructed in accordance with them there is of necessity continuous reference to inquiries lying beyond the prescribed limits.

A certain analysis of some methods of ordinary thinking, based to a very large extent on language, and resembling in many respects grammatical study, has long been current in educational practice as logic, and to those whose conception of the subject has been formed from acquaintance with this imperfect body of rules and formulæ it may appear a violent and unnecessary extension of the term to apply it to the all-comprehensive theory of knowledge. The reasons, however, are imperative; and, as these would lead one to deny the right of this elementary practical discipline to the possession of the title, it is desirable to conclude by offering a single remark on the place and function of this currently designated logic.

Not much trouble is required in order to see that the ordinary school or formal logic can lay no claim to scientific completeness. Its principles are imperfect, dubious, and most variously conceived; it possesses no method by which development from these principles is possible; it has no criterion by which to test the adequacy of its abstract forms as representations of the laws of concrete thinking. Accordingly it is handled, in whole and in detail, in the most distractingly various fashion, and were it indeed entitled to the honorable designation of logic the prospects of that science might well be despaired of. But in fact the school logic discharges a function for which exhaustiveness of logical analysis is not a requisite. It has a *raison d'être* in the circumstance that training to abstract methods must needs be a graduated process, and that, whether as a means towards the prosecution of philosophic study in especial, or as instrument of general educational value, practice in dealing with abstract thoughts must have value. Such elementary practice naturally bases itself on the kinds of distinction apparent in the concrete thinking of those to whom it is applied, and for this reason school logic not only connects itself with and is in a sense the development of grammar and grammatical analysis and synthesis, but may, to a limited extent, include reference to some of the simpler processes of scientific method. In all probability the discord observable among the ordinary treatises on school logic is due to the want of recognition of the true place which can thus be assigned to the subject treated. The doctrine has a propædeutic but not a scientific value.

Note A.

Histories of Logic.—No complete history of logic, apart from philosophy in general, exists; but of the Aristotelian logic, in its system and in its development throughout the ancient and mediæval epochs, we possess a most adequate history in Prantl's *Geschichte der Logik im Abendlande* (i., 1855; ii., 1861; iii., 1867; iv., 1870), extending to the close of the mediæval period.

The following are some of the more important contributions towards a history of logic, whether in independent works or in portions of systematic treatises: most of them, indeed, of small value:—Ramus, *Scholæ Dialecticæ*, bk. i. chaps. 1–8; Keckermann, *Systemæ Logicæ*, 1598; Gassendi, *Opera*, i. 35–66; Fabricius, *Specimen elenchicum historiæ logicæ*, 1699; Walch, *Parerga Academica* (1721), pp. 453–848; Darjes, *Via ad Veritatem*, appendix, 1755; Buhle, in *Commentat. Soc. Gotting.*, vol. x.; Fülleborn, *Beiträge z. Gesch. d. Phil.* (1794), pt. iv. pp. 160–80; Eberstein, *Gesch. d. Logik u. Metaphysik bei den Deutschen von Leibnitz bis auf gegenwärtige Zeit* (2d ed., 1794), useful as a survey of the Wolffian logics; Calker, *Denklehre* (1822), pp. 12–198; Bachmann, *System der Logik* (1828), pp. 569–644; Mussmann, *De Logicæ ac Dialecticæ notione historica*, 1828; Troxler, *Logik* (1830), vol. iii.; Sigwart, *De historia logicæ inter Græcos usque ad Socratem*, 1832; St. Hilaire, *De la Logique d'Aristote* (1838), ii. pp. 93–312; Franck, *Esquisse d'une histoire de la logique*, 1838; Reiffenburg, *Principes de logique*, 1839 (with bibliography); Treudelenburg, *Gesch. d. Kategorienlehre*, 1846; Blakey, *History of Logic*, and *Essay on Logic* (2d ed., 1848), with bibliographical appendix; Hoffmann, *Grundzüge einer Geschichte der Begriff der Logik in Deutschland von Kant bis Baader*, 1851; K. Fischer, *Logik u. Metaphysik* (2d ed., 1865), pp. 16–182, a valuable critique of some modern doctrines; Rabus, *Logik und Metaphysik* (1868), i. pp. 123–242, excellent; Ueberweg, *System der Logik* (4th ed., 1874), pp. 15–66, excellent critical account; Ragnisco, *Storia critica delle Kategorie*, 1871, 2 vols.; Rabus, *Die neuesten Bestrebungen auf dem Gebiete der Logik bei den Deutschen*, 1880; Harms, *Geschichte der Logik*, 1881; Venn, *Symbolic Logic*, 1881 (introduction, and pp. 405–444), a valuable contribution to the history and bibliography of the application of symbolic methods in logic. The only good bibliography of logic is that given by Rabus in his *Logik u. Metaphysik*, i. pp. 453–518. Some of the older lexicons, *e. g.*, Lipenius, *Bibliotheca Realis* (1685), *s. vv.* "Logica," "Organon," "Dialectica," contain great store of bibliographical references. A complete bibliography is a desideratum.

Note B.

Hindu Systems of Logic.—In almost all the Hindu systems of philosophy, as these are classified by the most recent authorities, indications are to be found of a more or less developed analysis of the process or method of reasoning, and therefore of a certain amount of logical theory. In two systems in particular the

iogical ciement is the most prominent feature. The *Nyâya*, or logical doctrine of Gotama, is in a very speciai sense the Hindu logic, whiie in the *Vaiseschika*, or Atomist system of Kanada, there are many expansions of or additions to the *Nyâya*, thongh the prevaiiing interest is not logical.

The most accessible sources of information regarding the Hindu logic, Colebrooke's *Essays*, and Professor M. Müiler's abstract (in tiie appendix to Archbishop Thomsón's *Laws of Thought*), tend to mingle in an undesirable fashion what is special to the Nyâya doctrine, and what is added by Kanada and his followers. In order to appreciate the extent to which the anaiysis of reasoning has been carried in these early systems, it is advisable to restrict atteution to the original exposition of the *Nyâya*.

The aim of Nyâya is the attainment of perfection, of bliss, through knowiedge. Bnt, to have knowledge in a systematic and compiete fashion, it is reqnisite that the individual should know (or shouid be capabie of organizing his knowledge in reference to) the sixteen great topics or heads of discussion. These, as enumerated by Gotama, are (1) proof; (2) the objects of proof; (3) doubt; (4) motive; (5) the illustration or example for disenssion; (6) the final assertion; (7) the enumeration of the five members of the finai assertiou; (8) confirmatory argument; (9) the conciusion, the defined jndgment; (10) the objection; (11) controversy; (12) dcceptive connter argument; (13) apparent reasou or sophism; (14) frand or wilfuiiy deceptive argument, ruse; (15) futile argument or self-contradictory counter argument; (16) conclusive refutation. Inspection of these at once shows that they represent stages in dialectic or in the process of clearing up knowledge by disenssion. The generaiia, *i. e.*, the kinds of proof, described as four in number—sense-perception, inference (either from canse to effect, from effect to cause, or from community of nature, *i. e.*, in a wide sense, analogy), comparison (anaiogy in stricter significance), tradition,—and the things about which proof may be exercised, under which a twelvefold division is given by Gotama, and enlarged in endless detail by his commentators, who introdnce thereunder much of Kanada's system, are first laid down as the basis for the whole. Then foiiows (Nos. 3–6) the progress from donbt, which first calis for reasoning or proof, through motive, to position of the problem in the form of an example or case, and to the generai assertion, as having valid grounds. The anaiysis of the grounds of assertion is then given, and here we have what corresponds more particularly to the syllogism as known to us. Five members are signaiized:—(1) the thesis or proposition to be proved; (2) the reason, or intermediate gronnd by which the subject of the proposition is linked on to an explanatory principle; (3) the explanatory principle; (4) the application of this explanatory principle; (5) the statement of the conclusion as foiiowing from the application. Thus, in the example usuaiiy given—(1) *thesis*, this monntain is fiery; (2) *intermediate ground*, because it smokes; (3) *explanatory principle*, whatever smokes is fiery, as, for instance, a hearth; (4) *application*, therefore this mountain is fiery; (5) *statement of conclusion*, the mountain, then, is fiery, because it smokes. There can be no donbt that in this somewhat unsystematic arrangement we have the ontlines of syliogistic argument. Considerable obscurity, however, rests over the third member, and it is only partially cleared up when we proceed to the uext topic, which may perhaps be transiated confirmatory argnment. Here the essence of the argument appears to be a regress from the known mark to the fundamental quality from which it follows. Thus, *e. g.*, if it were said *the mountain is not fiery*, then the argument would be adduced, but *the mountain smokes*, and what is not fiery does not smoke. Apparentiy there is involved the assumption that the mark is a necessary consequence of the primary quality, but the exposition is obscure, and, doubtless, connects itself with the principies of causal connection recognized by Hindu thinkers. (See Wiiliams, as below, pp. 73–4).

When the conclusion has thus been confirmed, when the negation of the ground has been shown to faii in explaining the observed fact, the thesis may be stated in an absolute and definitive form (topic 9). The remaining seven topics are then concerned with the discussion which may arise when an opponent brings forward objections to the conclusion. This he must do by positing his antithesis (10), whereupon issue may be joined (11). Should the adversary be unable to establish his antithesis, he may resort to dceeit, bringing forward arguments, iiiogicaiiy arranged and devoid of force (12), which soon leads to the employment of sophisms (13) or merely apparent arguments, and even to deceitful ruses (14). Under these topics the *Nyâya* signalizes and discusses various weii-known forms of faiiacy. The destruction of all these faiiacious arguments reduces the opponent to the empioyment of futile, irrelevant responses, which undermine his own position (15), and the exposure of which completes his discomfiture and reduces him to siieuce (16).

Expositions of this dialectic system are not yet available in snch kind and amount as would enable one to do full justice to it. Evidently much patience and a very considerable knowledge of the current phiiosophical view wonld be requisite in order to appreciate at their true worth many apparentiy formai, and in some cases dubious, divisions. Of acconnts which may be consnited the following seem the more important:—Colebrooke's *Essays on the Religion and Philosophy of the Hindus*, from which the expositions in Ritter (*Ges. d. Phil.*, iv. 382 *sq.*), Hegel (*Werke*, xiii. 161–167), and Cousin (*Histoire Générale*, Leçon ii.) are taken; Ward's *Account of the History, Literature, and Religion of the Hindoos* (4 vols. 1811; later editions, with titie aitered, in 1815, 1817, 1821); Windischmann, *Philosophie im Fortgang der Weltgeschichte* (1834), specially pp. 1895–1920; M. Müller, appendix to Thomson's *Laws of Thought*; Rosenkranz, *Die Modificationen der Logik* (1846), pp. 184–97; Williams, *Indian Wisdom*, pp. 71–88; St. Hiiaire, articles "Indiens," "Gotama," "Nyâya," "Kanada," in the *Dictionnaire Philosophique*, and translation, with commentary, of part of Gotama's "Sûtras," in the *Mémoires de l'Académie des Sciences Morales et Politiques*, tom. iii.

Note C.

Ramus.—The logicai theories of Ramus acquired for a brief period a factitious importance from their connection with the general revolt against Aristotelianism, and with the Protestant struggle against the Roman Catholic authority. In themselves they have no particular value, nor indeed much originaiity, and the exposition of them by their author, always rather literary than philosophic, adds nothing of strength or interest. In comparison with the Aristoteiian anaiysis of the forms and methods of thinking, the few alterations of statement, and generaiiy the thin residuum of logical theory, which characterize Ramist work, appear as singularly insignificant. Nor have any of the speciai peculiarities of the Ramist logic exercised infineuce on the history of logical doctrines. The keenness of the controversy which raged in so many of the centres of learning between the Aristotelians and the total or partial Ramists is explicable only as having reference to differences which were merely symbolized by the apparent difference in logical doctrine.

In the Protestant universities and seminaries generally the Ramist logic obtained, and for some time kept, a firm footing. In Scotland, through Melville, Buchanan, and the earl of Murray, who had been a pupil of Ramus, his system was instalied as the orthodox staple of logical training, and snch records as remain of Scottish university education during the tronbied 16th century wonid undoubtedly exhibit the traces of this new movement. In England, Cambridge alone, always disposed to reject the authority of Aristotle, and generaiiy more open to new ideas than the sister university, was a stronghold of Ramism, and, apart from special works of Ramist tendency, the influence of the new doctrine is discernible in the writings of more than one Cambridge alumnus. Wiiliam Tempie, a friend of Sir Philip Sidney, and an official of the university, published a volume of *Scholia in Rami Dialecticam*, 1591; George Downam, prælector on logic, wrote commentaries *In Petri Rami Dialecticam*, 1606; and Milton, in 1672, expanded the *Dialectica* in his *Artis Logicæ Plenior Institutio*. Marlowe's *Faustus*, and his *Massacre of St. Bartholomew*, show how familiar Ramist phraseology and the personality of Ramus must have been to an alumnus of Cambridge, while Bacon, with weil-grounded objection to much of the Ramist method, expounds the system of iogic with unmistakable reference to the Ramist principies and method of arrangement. There is a monograph on Ramus by Ch. Waddington with a good bibliography—*Ramus (Pierre de la Ramée): sa Vie, ses Écrits, et ses Opinions*, Paris, 1856—and a slighter work, mainly biographical, by Ch. Desmaze (*P. Ramus, Professeur au Collége de France: sa Vie, ses Écrits, sa Mort*, 1515–72, Paris, 1864). In Lipenius (*Bibliotheca Realis, s. v.* "Ramus") will be found a long list of writings for and against the Ramist logic. The history of the movement is also given in Buhle (*Gesch. d. neuern Phil.*, ii. 680–702), Tennemann (*Gesch. d. Phil.*, ix. pp. 420–42) Du Boulay (*His. Univer. Paris*, tom. iv.), Crevier (*His. de l'Univ. de Paris*, vol. v.), in Jo. Hermannus ab Elswich (*Schediasma de varia, Aristotelis in scholis Protestantium fortuna*, §§ 21–29), De Launoy (*De Varia Aristot. in Acad. Paris fortuna*, cap. xiii.), and in Bayle (*Dictionnaire, s. v.* "Ramus"). (R. AD.)

LOGOS. This term is one of the most constant factors in ancient speculation. As it is double-sided, however, expressing both *reason* and *word*, the conceptions which it covers differ widely. Taken broadly the doctrine of the Logos may be said to have run in two parallel courses—the one philosophical, the other theological; the one the development of the Logos as reason, the other the development of the Logos as word; the one Hellenic, the other Hebrew.

1. To the Greek mind, which saw in the world a κόσμος, it was natural to regard the world as the product of reason, and reason as the ruling principle in the world. So we find a Logos doctrine more or less prominent from the dawn of Hellenic thought to its eclipse. It rises in the realm of physical speculation, passes over into the territory of ethics and theology, and makes its way through at least three well-defined stages. These are marked off by the names of Heraclitus of Ephesus, the Stoics, and Philo.

It acquires its first importance in the theories of Heraclitus. There it is intimately associated with the dominant ideas of a flux in all things, and of fire as the material substrate or primary form of existence. On the one hand the Logos is identified with γνόμη and connected with δίκη, which latter seems to have the function of correcting deviations from the eternal law that rules in things. On the other hand it is not positively distinguished either from the ethereal fire, or from the εἱμαρμένη and the ἀνάγκη according to which all things occur. In consistency with his hylozoic doctrine Heraclitus holds that nothing material can be thought of without this Logos, but he does not conceive the Logos itself to be immaterial. Whether it is regarded as in any sense possessed of intelligence and

consciousness is a question variously answered. But there is most to say for the negative. This Logos is not one above the world or prior to it, but in the world and inseparable from it. Man's soul is a part of it. It is *relation*, therefore, as Schleiermacher expresses it, or reason, not speech or word. And it is objective, not subjective, reason. The process of transition between opposites, in which all things are involved, is a process according to orderly relations and definite measures, and the Logos is the eternal principle of this world-process which shows itself in the form of a constant conflict between opposites. Like a law of nature, objective in the world, it gives order and regularity to the movement of things, and makes the system rational.[1]

Between Heraclitus and the Stoics comparatively little was done in developing a special Logos doctrine. With Anaxagoras a conception entered which gradually triumphed over that of Heraclitus, namely, the conception of a supreme, intellectual principle, not identified with the world but independent of it. This, however, was νοῦς, not Logos. In the Platonic and Aristotelian system, too, the Logos appears. But it is subordinate to other more distinctive conceptions, and lacks the definiteness of a doctrine. With Plato the term selected for the expression of the principle to which the order visible in the universe is due is νοῦς or σοφία, not λόγος. It is in the pseudo-Platonic *Epinomis* that λόγος appears as a synonym for νοῦς. In Aristotle, again, the principle which sets all nature under the rule of thought, and directs it towards a rational end, is νοῦς, or the divine spirit itself; while λόγος is a term with many senses, used as more or less identical with a number of phrases, οὐ ἕνεκα, ἐνέργεια, ἐντελέχεια, οὐσία, εἶδος, μορφή, etc.

With the Stoics, however, the Logos doctrine reappears in great breadth. It is a capital element in their system. With their teleological views of the world they naturally predicated an active principle in connection with it, living in it and determining it. This operative principle is called both Logos and God. It is conceived of as material, and is described in terms used equally of nature and of God. There is at the same time the special doctrine of the λόγος σπερματικός, the seminal Logos, or the law of generation in the world, the principle of the active reason working in dead matter. This parts into λόγοι σπερματικοί, which are akin, not to the Platonic ideas, but rather to the λόγοι ἔνυλοι of Aristotle. In man, too, there is a Logos which is his characteristic possession, and which is ἐνδιάθετος, as long as it is a thought resident within his breast, but προφορικός when it is expressed as a word. This distinction between Logos as *ratio* and Logos as *oratio*, so much used subsequently by Philo and the Christian fathers, had been so far anticipated by Aristotle's distinction between the ἔξω λόγος and the λόγος ἐν τῇ ψυχῇ. The Logos of the Stoics is a reason in the world gifted with intelligence, and analogous to the reason in man.[2]

In the period between the Stoics and Philo there are few names of distinct interest in this connection. But in the Alexandrian philosophy the Logos doctrine assumes a leading place, and shapes a new career for itself. The chief representative of this school is the Hellenized Jew, Philo (born about 25 B. C.). With him God is absolute and incorporeal perfection, apprehensible only by reason, and incapable of contact with matter. An intermediate agent, therefore, is affirmed, the Logos or idea of ideas. This Logos is not eternal in the sense in which God is eternal, but has its being from Him. It is His elder son, as the world is His younger. It resides with God as His wisdom, and is in the world as the divine reason. It is God's instrument in creation and in revelation. Both in the world and in man it is twofold. In man it subsists as the λόγος ἐνδιάθετος or immanent reason, and as the λόγος προφορικός or uttered reason. In the case of the world there is the Logos which has its residence with the archetypal ideas, and there is the Logos which appears in the form of many λόγοι or rational germs of things material. Philo's doctrine is moulded by three forces—Platonism, Stoicism, and the Old Testament. His Logos is the representative of the world to God as well as of God to the world. It is described as the "image of God" (εἰκὼν θεοῦ, i. 6) and the "archetypal man" (ὁ κατ' εἰκόνα ἄνθρωπος, i. 427), as the "son of God" and the "high priest" (ἀρχιερεύς, i. 653), as the "first-born son" (πρωτόγονος, i. 414), the "man of God" (ἄνθρωπος θεοῦ, i. 411), etc. It wavers all the while between attribute and substance, between the personal and the impersonal.

In the later developments of Hellenic speculation nothing essential was added to the doctrine of the Logos. Philo's distinction between God and His rational power or Logos in contact with the world was generally maintained by the eclectic Platonists and Neo-Platonists. By some of these this distinction was carried out to the extent of predicating (as was done by Numenius of Apamea) three Gods:—the supreme God; the second God, or Demiurge or Logos; and the third God, or the world. Plotinus explained the λόγοι as constructive forces, proceeding from the ideas and giving form to the dead matter of sensible things (*Enneads*, v. 1, 8, and Richter's *Neu-Plat Studien*).

2. The doctrine of the Logos in Hellenic thought thus remains substantially a doctrine of the Logos as reason. The other side, the doctrine of the Logos as word, belongs as essentially to Hebrew thought. The roots of this conception lie in the Hebrew Scriptures. The God who is made known in the Old Testament is one who reveals Himself actively in history. He is exhibited, therefore, as speaking, and by His word communicating His will. The word of the God of revelation is represented as the creative principle (Gen. i. 3; Psalm xxxiii. 6), as the executor of the divine judgments (Hosea vi. 5), as healing (Psalm cvii. 20), as possessed of almost personal qualities (Isaiah lv. 11; Psalm cxlvii. 15). Along with this comes the doctrine of the angel of Jehovah, the angel of the covenant, the angel of the presence, in whom God manifests Himself, and who is sometimes identified with Jehovah or Elohim (Gen. xvi. 11, 13; xxxii. 29–31; Exod. iii. 2; xiii. 21), sometimes distinguished from Him (Gen. xxii. 15, etc.; xxiv. 7; xxviii. 12, etc.), and sometimes presented in both aspects (Judges ii., vi.; Zech. i.). To this must be added the doctrine of Wisdom, given in the books of Job and Proverbs. As the Word of God is represented in the theocratic sections of the Old Testament as the creative principle of the world, so Wisdom appears with somewhat similar functions in these books. At one time it is exhibited as an attribute of God (Prov. iii. 19). At another it is strongly personified, so as to become rather the creative thought of God than a quality (Prov. viii. 22). Again it is described as proceeding from God as the principle of creation and objective to Him. In these and kindred passages (Job xv. 7, etc.) it is on the way to become hypostatized.

The Hebrew conception is partially associated with the Greek in the case of Aristobulus, the predecessor of Philo, and, according to the fathers, the founder of the Alexandrian school. He speaks of Wisdom in a way reminding us of the book of Proverbs. The pseudo-Solomonic *Book of Wisdom* (generally supposed to be the work of an Alexandrian flourishing somewhere between Aristobulus and Philo) deals both with the Wisdom and with the Logos. It fails to hypostatize either. But it represents the former as the framer of the world, as the power or spirit of God, active alike in the physical, the intellectual, and the ethical domain, and apparently objective to God. Points of affinity between the Hellenic and Hebrew conceptions are also seen in the books of Maccabees (see, *e. g.*, 2 Macc. iii. 38). In these instances, however, and even in Philo, the Hebrew elements are only partially grasped and appropriated. In the Targums, on the other hand, the three doctrines of

Cf. Schleiermacher's *Herakleitos der Dunkle*, etc.; Bernays's *Heraclitea*; Gladisch's *Heracleitos und Zoroaster*.

[2] *Cf.* especially Zeller's *Phil. der Gr.*, 2d ed., vol. iii.; or Reichel's translation, *The Stoics, Epicureans, and Sceptics*.

the word, the angel, and the wisdom of God converge in a very definite conception. In the Jewish theology God is represented as purely transcendent, having no likeness of nature with man, and making no personal entrance into history. Instead of the immediate relation of God to the world the Targums introduce the ideas of the *Mêmrâ* (word) and the *Shechînâ*. This Memra, or, as it is also designated, *Dibbûrâ*, is an hypostasis that takes the place of God when direct intercourse with man is in view. In all those passages of the Old Testament where anthropomorphic terms are used of God, the Memra is substituted for God. The Memra proceeds from God, and retains the creaturely relation to God. It does not seem to have been identified with the Messiah.[1]

The Hebrew Logos and the Old Testament doctrine reach their climax in the prologue to John's Gospel. The three conceptions of the active Word, the Angel, and the Wisdom of God, which had been fused in the Rabbinical idea of a Memra, meet there in the final grandeur of the Word of God incarnate. The question of the *genesis* of the Johannine doctrine has been greatly debated. There is a remarkable similarity between John's terms and Philo's. But this is due mainly to the fact that John and Philo made use of the same inherited phraseology for the expression of their several doctrines. The Johannine doctrine is not derived from the Philonic. The Logos of Philo is distinctively reason; the Logos of John is Word. The one is metaphysical; the other is theological. In Philo the Logos is the divine principle that creates and sustains. In John the Logos who creates also redeems. In Philo the Logos hovers midway between the personal and the impersonal. In John he is a distinct personality. To Philo the idea of an incarnation of God is alien and abhorrent. The heart of John's doctrine is the historical fact that the Word was made flesh.

In many of the early Christian writers, as well as in the heterodox schools, the Logos doctrine is influenced by the Greek idea. The Syrian Gnostic Basilides held (according to Irenæus, i. 24) that the Logos or Word emanated from the νοῦς, or personified reason, as this latter emanated from the unbegotten Father. The completest type of Gnosticism, the Valentinian, regarded Wisdom as the last of the series of æons that emanated from the original Being or Father, and the Logos as an emanation from the first two principles that issued from God, Reason (νοῦς) and Truth. Justin Martyr, the first of the sub-apostolic fathers, taught that God produced of His own nature a rational power (δύναμίν τινα λογικήν), His agent in creation, who now became man in Jesus (*Dial. c. Tryph.*, chap. 48, 60). He affirmed also the action of the λόγος σπερματικός (*Apol.*, i. 46; ii. 13, etc.). With Tatian (*Cohort. ad. Gr.*, chap. 5, etc.) the Logos is the beginning of the world, the reason that comes into being as the sharer of God's rational power. With Athenagoras (*Suppl.*, chap. 9, 10) He is the prototype of the world and the energizing principle (ἰδέα καὶ ἐνέργεια) of things. Theophilus (*Ad Autolyc.*, ii. 10, 24) taught that the Logos was in eternity with God as the λόγος ἐνδιάθετος, the counsellor of God, and that when the world was to be created God sent forth this counsellor (σύμβουλος) from himself as the λόγος προφορικός, yet so that the begotten Logos did not cease to be a part of Himself. With Hippolytus (*Refut.*, x. 32, etc.) the Logos, produced of God's own substance, is both the divine intelligence that appears in the world as the Son of God, and the idea of the universe immanent in God. The early Sabellians (comp. Eusch., *Hist. Eccl.*, vi. 33; Athan., *Contra Arian.*, iv.) held that the Logos was a faculty of God, the divine reason, immanent in God eternally, but not in distinct personality prior to the historical manfestation in Christ. Origen, referring the act of creation to eternity instead of to time, affirmed the eternal personal existence of the Logos. In relation to God this Logos or Son was a copy of the original, and as such inferior to that. In relation to the world he was its prototype, the ἰδέα ἰδεῶν, and its redeeming power (*Contra Cels.*, v. 608; *Frag. de Princip.*, i. 4; *De Princip.*, i. 109, 324).

Literature.—In addition to the histories of philosophy (*e. g.*, those of Ritter, Ueberweg, Zeller, etc.), the commentaries on John's Gospel (Lücke, Godet, Westcott, etc.), and the systems of Biblical theology (Oehler, Schultz Immer, Weiss, etc.), the following writings deserve special notice:—Schürer, *Lehrb. der N.-T. Zeitgeschichte;* Hausrath, *Neu-Testamentliche Zeitgeschichte;* Heinze, *Lehre vom Logos in der griechischen Philosophie;* Soulier, *La Doctrine du Logos;* Gfrörer, *Philo;* Siegfried, *Philo;* Daehne, *Geschichtliche Darstellung der Jüdisch-alexandrinischen Religions-Philosophie;* Dorner, *History of the Development of the Doctrine of the Person of Christ;* Huber, *Philosophie der Kirchenväter;* Weber, *System der Alt-Synagogalen Palästinischen Theologie;* Grossmann, *Quæstiones Philoneæ.* (S. D. F. S.)

[1] *Cf.* the Targum of Onkelos on the Pentateuch under Gen. vii. 16, xvii. 2, xxi. 20; Exod. xix. 16, etc.; the Jerusalem Targum on Numb. vii. 89, etc.

LOGROÑO, an inland province of Spain, the smallest of the eight modern divisions of Old Castile, is bounded on the N. by Burgos, Alava, and Navarre, on the E. by Navarre and Zaragoza, on the S. by Soria, and on the W. by Burgos. The area is 1946 square miles, with a population in 1900 of 189,346. It belongs entirely to the basin of the river Ebro, which forms its northern boundary except for a short distance near San Vicente, and is now navigable throughout the entire length of the province; its drainage takes place chiefly by the rivers Tiron, Oja, Najerilla, Iregua, Leza, Cidacos, and Alhama, all flowing in a north-easterly direction. The portion skirting the Ebro forms a spacious and for the most part fertile undulating plain, called La Rioja in its western part; but in the south Logroño is considerably broken up by offshoots from the sierras which separate that river from the Douro. In the east the Cerro de Lorenzo rises to a height of about 7725 feet, and in the south the Pico Santa Ines is upwards of 7380 feet. The mineral resources, which are believed to be considerable, are as yet undeveloped. The products of the province are chiefly cereals, good oil and wine (especially in the Rioja), fruit (except oranges and lemons), silk, flax, and honey. The industries, which are unimportant, include spinning and weaving. Logroño is traversed by the Ebro valley railway, which connects Miranda del Ebro with Zaragoza; on this line are situated all the towns of the province with a population exceeding 5000—Haro, Logroño, Calahorra, and Alfaro.

LOGROÑO, capital of the above province, is situated on the right bank of the Ebro, which is here crossed by a handsome stone bridge of twelve arches, dating from 1138; the surrounding plain is well cultivated and fertile, producing the rich Rioja wine. The city is the seat of the usual provincial authorities, civil and military. It has a theatre, and several hospitals and convents. The parish church claims great antiquity. The population in 1900 was 19,500; the trade and industries are unimportant.

The district of Logroño was in ancient times inhabited by the *Berones* or *Verones* of Strabo and Pliny, and their *Varia* is to be identified with the modern suburb of the city of Logroño now known as Varea or Barca. The place fell into the hands of the Moors in the 8th century, but was speedily retaken by the Christians, and under the name of *Lucronius* appears with frequency in mediæval history. Logroño was the birthplace of the painter Navarrete (el Mudo) and of Espartero; the latter died there on January 9, 1879.

LOGWOOD is a valuable dye-wood, the product of a leguminous tree, *Hæmatoxylon campechianum*, native of Central America, and grown also in the West Indian Islands. The tree attains a height not exceeding 40 feet, and is said to be ready for felling when about ten years old. The wood, deprived of its bark and the sap-wood, is sent into the market in the form of large blocks and billets. It is very hard and dense, and externally has a dark brownish-red color; but it is less deeply colored within. The best qualities come from Campeachy, but it is obtained there only in small quantity. A large export trade in logwood of good quality is carried on from Honduras and Jamaica, and inferior qualities are exported from St. Domingo, Martinique, Guadaloupe, etc. The wood was introduced into Europe as a dyeing substance soon after the discovery of America, but for many years (from 1581 to 1662) its use in England was prohibited by legislative enactment on account of the inferior dyes which at first were produced by its employment.

The coloring principle of logwood exists in the timber in the form of a glucoside, from which it is liberated as hæma-

toxylin or hæmatin by fermentation. Hæmatoxylin was first isolated by Chevreul in 1810, and its constitution was subsequently investigated by Erdmann, who found it to have the formula $C_{16}H_{14}O_6$. It forms two crystalline hydrates, the principal combination being with three molecules of water. This hydrate, $C_{16}H_{14}O_6 + 3H_2O$, is a colorless body very sparingly soluble in cold water, but dissolving freely in hot water and in alcohol. By exposure to the air, especially in alkaline solutions, hæmatoxylin is rapidly oxidized into hæmatein, with the development of a fine purple color. The reaction consists in the elimination of two atoms of hydrogen, thus:—hæmatoxylin hydrate $(C_{16}H_{14}O_6 + 3H_2O) + O$ = hæmatein $(C_{16}H_{12}O_6 + 3H_2O) + H_2O$. This reaction of hæmatoxylin is exceedingly rapid and delicate, rendering that body a valuable laboratory test for alkalies. It is remarkable that the difference of two atoms of hydrogen between colorless hæmatoxylin and colored hæmatein is precisely that which exists between the white and the blue forms of indigo. By the action of hydrogen and sulphurous acid, hæmatein is easily reduced to hæmatoxylin.

Logwood is prepared for use by dyers, etc., in the form of chips and raspings, and as a solid brittle black extract. Chipped logwood is moistened with water and spread in thin layers till a gentle fermentation sets up, whereby, under the influence of liberated ammonia, hæmatoxylin is formed from the glucoside. By exposure to the air, through repeated turnings of the mass, hæmatein is developed from the hæmatoxylin, and the chips gradually become coated with the brilliant metallic green crystals of hæmatein. Logwood extract, largely used in calico printing, is obtained from oxidized chips and raspings by lixiviation, the solution being concentrated at as low a temperature as possible.

The principal use of logwood is for dyeing wool and woollen goods, on which it produces, with various mordants, shades of blue from a light lavender to a dense blue-black, according to the amount of logwood used. It is more employed in combination with other dyestuffs than as the sole tinctorial agent, the best and most permanent blacks on wool, known as woaded blacks, being first dyed blue in the indigo vat, and finished black with logwood and bichromate of potash. In calico-printing logwood is used to produce steam purples, for the production of which the calico is mordanted with stannate of soda, and printed with a strong solution of logwood extract thickened with starch. By steaming, the hæmatein of the logwood combines with binoxide of tin precipitated in the fibre, and thus develops a bright purple color. Logwood blacks, which are a standard product of print works, are produced by mordanting with iron liquor, passing the calico through a logwood solution, and developing and fixing the color by treatment with a weak solution of bichromate of potash. Logwood blacks assume a bright red tint by the action of dilute acids, a test by which they can readily be distinguished from aniline and other fast blacks. Logwood is also largely used in the preparation of INK (*q. v.*), and to a small extent in medicine. The imports of logwood into the United Kingdom during the year 1880 amounted to 69,280 tons, the estimated value of which was £192,392.

LOHÁRDAGÁ, or LOHARDUGGA, a district in the lieutenant-governorship of Bengal, India, between 22° 20′ and 24° 39′ N. lat. and 83° 22′ and 85° 56′ E. long., is bounded on the N. by Hazáribágh and Gayá, on the N. W. and W. by Mírzápur district and Sargújá and Jashpur states, and on the S. E. and E. by Sinhbhúm and Manbhúm districts. It comprises Chutiá Nágpur proper, and the Palámau subdivision. Chutiá Nágpur is an elevated table-land, forming the central and south-eastern portion of Lohárdagá district; its surface is undulating, and the slopes of the depressions lying between the ridges are cut into terraces covered with rice. Palámau, which forms the north-western portion of the district, consists on the east and south of spurs thrown off from the plateaus of Hazáribágh and Chutiá Nágpur, while the remainder of the tract is a tangled mass of isolated peaks and long irregular stretches of broken hills. The average elevation of Palámau is about 1200 feet above sea-level, but some peaks rise to over 3000 feet. This part of the district contains no level areas of any extent, except the valleys of the North Koel and Amánat rivers, to which rice cultivation is confined. The principal rivers of Lohárdagá are the Subarnarekhá and the North and South Koel. The entire district was probably at one time overgrown with dense forest, but the forest area has been continually dwindling, owing to the spread of cultivation and the practice of girdling the *sál* trees for resin.

The census of 1872 disclosed a total population of 1,237,123 (621,548 males and 615,575 females), spread over an area of 12,044 square miles; of these only 91 were returned as Europeans and 3 as of mixed race. The aboriginal element is very strongly represented—the Mundas numbering 163,051; Kols, 132,104; and Uráons, 151,810. The most numerous among the semi-aboriginal tribes are—the Bhuíyás, 45,008; Kharwárs, 33,573; Bhogtas, 33,452; and Dosádhs, 25,223. The Hindus number 741,952, and Mohammedans 58,211. The Christian population is larger than in any other Bengal district, except the metropolitan one of the Twenty-four Parganás. In 1872 the total Christian population numbered 12,781, of whom 12,687 were natives, nearly all belonging to the aboriginal tribes of Mundas and Uráons. Most of them are poor, but they possess considerable influence, and are rising in public esteem. The two missions are the German Lutheran and Church of England, which successfully work together side by side. The population is entirely rural, Ranchí town (12,086) being the only place with more than 5000 inhabitants. Rice forms the staple crop; other crops are wheat, barley, Indian corn, millets, peas, gram, oilseeds, *pán*, cotton, and tobacco. Opium cultivation was introduced in 1869, and in 1874–75 yielded 245 cwts. There are two small tea plantations. Mildew and blights occasionally attack the crops; droughts seldom affect any considerable area. The principal trading place is Garwá in Palámau. Stick lac, resin, catechu, silk cocoons, hides, oil-seeds, *ghí*, cotton, and iron are here collected for exportation; while rice and other food grains, brass vessels, piece goods, blankets, broad cloth, silk, salt, tobacco, spices, drugs, and beads are brought to market for local consumption. The manufactures consist of shell-lac, inferior articles of brass and iron work, coarse cloth, blankets, mats, baskets, rope, and rude pottery. Iron, lime, and soapstone are worked in small quantities; gold is washed by the poorer classes from the sands of the rivers. An important coal-bearing tract, known as the Daltonganj coal-field, covers an area of nearly 200 square miles, and lies partly in the valley of the Koel river, and partly in that of the Amánat. The net revenue of the district in 1870–71 was £29,900, and the expenditure £22,563. The schools in 1876–77 numbered 303, with 8088 pupils. The climate of the table-land of Chutiá Nágpur is said to be superior to that of any other part of India, except the lower ranges of the Himálayas. The hot weather extends over almost six weeks, commencing about the 20th April, but is never really oppressive. The rainy season lasts from the middle of June to about the first week in October. The principal diseases are malarious fever and rheumatism of a severe type.

LOIRE (Lat., *Liger*), the first of the rivers of France in length of course (626 miles) and extent of basin (44,979 square miles), has its headwaters in the great central plateau, and is considered to take its rise in the Gerbier de Jonc, in the department of Ardèche, at a height of 4504 feet above the sea,—though the Allier branch, which has its source about 30 miles west, in the department of Lozère, at the foot of Maure de la Gardille, 4668 feet above the sea, has an almost equal course. The two streams continue to run parallel till the upper Loire turns westward and is joined by the Allier in the neighborhood of Nevers. All the more important affluents of the upper and middle part of the Loire—as the Cher, the Indre, the Vienne, respectively 198, 152, and 231 miles in length—have their gathering grounds in the central plateau. In the north-east the basin of the Seine comes so close (at one place to within 6 or 7 miles) that the versant towards the Loire has hardly anything to contribute; and it is not till within 65 miles of the estuary that we find an important tributary, the Maine, bringing down the drainage of the Brittany plateau. At certain seasons the Loire is navigable for ships as far as Nantes (33 miles), for boats as far as La Noirie (other 518 miles), and for rafts as far as Retournac; but for six months of the year navigation is practically impossible.

In the volume of water there is all the irregularity of a mountain torrent; at the Bec d'Allier, for instance,—the meeting point of the two head streams,—while the maximum current is 353,200 cubic feet per second, the minimum is 10,600 cubic feet, and above Orleans the range lies between 31,800 and 850. During the drought of summer thin and feeble streams thread their way between the sandbanks of the channel; while at other times a stupendous flood pours down and submerges wide reaches of land. In the middle part of its course the Loire traverses the western portion of the undulating Paris basin, with its Tertiary marls, sands, and clays, and the alluvium carried off from these renders its lower channel inconstant; the rest of the drainage area is occuped by crystalline rocks, over the hard surface of which the water, undiminished by absorption, flows rapidly into the streams. A fall of from 3 to 4 inches over the whole river basin is sufficient to pour 35,320,000,000 cubic feet of water into the channels. When the rain is general over the whole area, the floods on the different tributaries reach the main river at different times; but when, through any cause, two or more of them arrive at the same time, inundations of the most serious character result. Attempts to control the river must have begun at a very early date, and by the close of the Middle Ages the bed between Orleans and Angers was enclosed by dykes 10 to 13 feet high. In 1783 a double line of dykes or *turcies* 23 feet high was completed from Bec d'Allier downwards. This great work had, however, the serious defect that the channel was so much narrowed that the embankments are almost certain to give way as soon as the water rises 16 feet (the average rise is about 14, and in 1846 it was more than 22). In more modern times the importance of the water-way from the sea to Nantes led to the embanking of the lower part of the course; but instead of a depth of 16 feet being secured, as the engineers anticipated, there is no more at full tide than 13 feet. One of the practical results of this state of matters has been the commercial development of Saint Nazaire and Paimbœuf, and the comparative decline of Nantes as a great shipping port. Besides the general embankments of the river, several of the towns along the Loire have constructed special works to defend themselves against the floods; Tours, the most exposed of all, is surrounded by a circular dyke. Various schemes for the systematic regulation of the Loire have been discussed. It has been proposed to construct in the upper valleys of the several affluents a number of gigantic dams or reservoirs from which the water, stored during flood, could be let off into the river as required. A reservoir of this kind, formed by the engineer Mathieu at the village of Pinay, about 18 miles above Roanne, and capable of retaining from 3500 to 4500 million cubic feet of water, has greatly diminished the force of the floods at Roanne, and maintained the comparative equilibrium of the current during the dry season. There is a canal (157 miles) along the left bank of the Loire between Roanne and Briare; and the Canal du Berri connects this with the navigable part of the Cher. The Canal du Centre extends from Digoin on the Loire to Châlon on the Saône; the Canal du Nivernais and the canals starting from Orleans and Briare communicate with the Seine; and the Nantes canal opens up the way to Lorient, Brest, and Dinan. The canals of the Sauldre and the Dive (20 and 26 miles respectively) are mainly for irrigation purposes.

See H. Blerzy, *Torrents, fleuves, et canaux de la France* (Paris, 1878), and his papers in *Rev. des Deux Mondes*, February and March, 1875.

LOIRE, a department of central France, made up of the old district of Forez and portions of Beaujolais and Lyonnais, all formerly included in the province of Lyonnais, lies between 45° 15′ and 46° 15′ N. lat. and between 3° 40′ and 4° 45′ E. long., and is bounded on the N. by the department of Sâone-et-Loire, on the E. by those of Rhône and Isère, on the S. by Ardèche and Haute-Loire, and on the W. by Puy de Dôme and Allier. Its extreme length is 78 miles from north-west to south-east, and its extreme breadth from east to west is about 43 miles, the area being 1852 square miles. Until 1790 it constituted a single department along with that of Rhône. About an eighth part of the whole area belongs to the basin of the Rhone. The Loire, which has a fall within the department from 1365 feet to 886 feet, traverses alternately a series of narrow gorges and of broad plains, the beds of ancient lakes, including that of Forez between St. Rambert and Feurs, and, lower down, that of Roanne. Of its affluents the most important are the Lignon du Nord, the beautiful valley of which has been called "La Suisse Forezienne," and the Aix on the left, and on the right the Ondaine (on which stand the industrial towns of Chambon-Feugerolles and Firminy), the Furens, and the Rhin. To the Rhone the department contributes the Gier, upon which are situated the industrial towns of St. Chamond and Rive de Gier, and which forms a navigable channel to the Rhone at Givors. From Mont Pilat descends the Deôme, in the valley of which the workshops of Annonay begin. In the west are the Forez mountains, which separate the Loire basin from that of the Allier; their highest point (Pierre sur Haute, 5381 feet) is 12 miles west from Montbrison. They sink gradually towards the north, and are successively called Bois Noirs (4239 feet), from their woods, and Monts de la Madeleine (3600 to 1640 feet). In the east the Rhone and Loire basins are separated by Mont Pilat (4705 feet) at the north extremity of the Cevennes, and by the hills of Lyonnais, Tarare, Beaujolais, and Charolais, none of which rise higher than 2950 or 3280 feet. The climate of the department varies according to the elevation: on the heights it is cold and healthy, unwholesome in the marshy plain of Forez, mild in the valley of the Rhone. The annual rainfall is 39·37 inches on the Forez mountains, but only 24·79 at Roanne. More than half of the area consists of arable lands; one-seventh is occupied by forests, and one-seventh by meadows.

The plains of Forez and Roanne are the two most important agricultural districts, but the total production of grain within the department is insufficient for the requirements of the population. The pasture lands of Forez support a large number of horned cattle, sheep, goats, and pigs. Fairly good red wine is also grown within the department; potatoes, leguminous plants, beetroot, hemp, and colza are also cultivated. Poultry is reared, and bee-keeping is a considerable industry. Among the hills replantation has been set on foot. The Bois Noir forests yield good-sized pines and large quantities of wood for mining purposes. The so-called Lyons chestnuts are to a large extent obtained from Forez; the woods and pasture lands of Pilat yield medicinal plants, such as mint. The chief wealth of the department, however, lies in the coal deposits in the St. Étienne basin, the second in importance in France. The basin, which stretches from south-west to north-east between Firminy and Rive de Gier, is about 20 miles in length and 5 in breadth. In 1881 the output amounted to 3,454,612 tons of coal and anthracite, giving employment to 12,000 workmen below and 5000 above. The presence of coal has naturally encouraged various forms of the metal-working industries. At St. Étienne there is a national factory of arms, in which as many as 6000 have been employed; apart from other factories of the same kind carried on by private individuals, the production of hardware occupies 7000 persons; locks, common cutlery, chain cables for the mines, files, and nails are also made. Cast steel is largely manufactured, the aggregate production of all sorts of steel amounting in 1880 to 114,629 tons; the Loire workshops supply the heaviest constructions required in naval architecture. The glass industry has its centre at Rive de Gier. St. Étienne employs more than 60,000 persons in the fabrication of silk ribbons, to an annual value of £4,000,000; over and above this must be reckoned the manufacture of elastic ribbons and laces, and the dressing of raw silks. The arrondissement of Roanne manufactures cotton stuffs upon 11,000 looms, each employing three persons. That of Montbrison produces table linen. In the mountains between Haute-Loire and Puy de Dôme the women make black laces and embroidery. The department has numerous flour-mills, paper works, tan-yards, boat-building yards, silk-spinning works, and velvet, plush, and hat factories. There are three arrondissements —St. Étienne, Montbrison, and Roanne. The capital is St. Étienne. The population, 290,903 in 1801, was 647,633 in 1901.

LOIRE, Haute-, a department of central France, made up of Velay and portions of Vivarais and Gévaudan, three districts formerly belonging to the old province of Languedoc, of a portion of Forez formerly belonging to Lyonnais, and of a portion of lower Auvergne, is bounded on the N. by Puy de Dôme and Loire, on the E. by Loire and Ardèche, on the S. by Ardèche and Lozère, and on the W. by Lozère and Cantal, and lies between 44° 40′ and 45° 25′ N. lat.

and between 3° 5′ and 4° 30′ E. long., having an extreme length of 68 miles, a maximum breadth of 54 miles, and an area of 1930 miles. It belongs almost wholly to the Loire basin, but a few square kilometres to the north of Mont Mézenc are drained by the Erieux, a tributary of the Rhone. The highest point, Mont Mézenc, on the borders of Ardèche, is 5745 feet; it belongs to the Cévennes system, which sends ramifications throughout the entire department, giving it a mean altitude of 2950 feet. Reckoning from east to west are the Boutières, the Mégal or Meygal, the Velay hills, those of La Margeride, and finally the Luguet. The first mentioned ridge separates Haute-Loire from Ardèche, and ranges from 3280 to 4590 feet; it has a crust of lava thrown out from Mont Mézenc; efforts towards replantation are being made. Meygal presents a series of jagged peaks, recalling the Pyrenees on a small scale. It also has been covered by an immense flow of lava some 37 miles long and 490 feet thick, through which the Loire has forced a passage by means of gorges more than 1600 feet in depth. The highest point of the Meygal properly so called is upwards of 4590 feet. The Velay hills, which separate the Loire from the Allier (mean height about 3300 feet), consist of granitic rocks overlaid with the eruptions of more than one hundred and fifty craters, one of which is now occupied by the singular lake of Bouchet. Westward from the Allier are the forest-clad granitic hills of La Margeride, which rise to a height of nearly 5000 feet. The Luguet massif (3300 feet) rises in the north-west of the department on the left bank of the Alagnon, a tributary of the Allier. The river Loire, to which the department owes its name, enters at a point 16 miles distant from its source, and 2923 feet above the level of the sea. Within the 63 miles of its course through the eastern portion of the department, first in a northerly and afterwards in a north-easterly direction, it falls 1565 feet. The Allier, which joins the Loire at Nevers, traverses the western portion of Haute-Loire in a northerly direction, entering at a point 25 miles distant from its source, and 2369 feet above the sea; it traverses a narrow and deep valley overhung by lofty hills, and falls 1090 feet. The chief affluents of the Loire within the limits of the department are the Borne on the left, joining it near Puy, and the Lignon, which descends from the Mézenc, between the Boutières and Meygal ranges, on the right. The climate, owing to the altitude, the northward direction of the valleys, and the winds from the Cévennes, is cold, the winters being long and rigorous. Storms and violent rains are frequent on the higher grounds, and would give rise to serious inundations were not the rivers for the most part confined within deep rocky channels. Two-fifths of the area is occupied by arable lands, one-fifth by natural meadow and by orchards, and a somewhat smaller proportion by wood. The rest consists of pasture lands, vineyards, and uncultivated lands.

Numerous cattle of the celebrated Mézenc breed are reared, and also sheep and mules. The crops raised are wheat, meslin, rye, barley, oats, maize, potatoes (in large quantity), hemp, colza, and second-class wine. The woods yield pine, fir, oak, and beech. Large quantities of aromatic and pharmaceutical plants are found in the Mézenc massif. The department has two coal basins,—those of Brassac and Langeac, both on the Allier; in 1880 their total output was 225,153 tons. Copper, iron, zinc, argentiferous lead, arsenic, antimony, barytes, and fluor spar are also obtained, and there are good quarries of trachyte and limestone, as well as numerous unutilized mineral springs. Lace-making in various materials is the most extensive industry, occupying from 100,000 to 130,000 persons, and producing goods to the annual value of about £1,000,000. Ribbons and cloth are manufactured to some extent, and silk-dressing, wool-spinning, caoutchouc-making, various kinds of smith work, paper-making, glass-blowing, brewing, wood-sawing, and flour-milling are also carried on. There are three arrondissements—Puy, Brioude, and Yssingeaux; the capital is Puy. The population in 1901 was 314,058.

LOIRE-INFÉRIEURE, a maritime department of western France, is made up of a portion of Brittany on the right and of the district of Retz on the left of the Loire, and lies between 46° 45′ and 47° 40′ N. lat. and between 55′ and 2° 32′ W. long., being bounded on the W. by the ocean, on the N. by Morbihan and Ille-et-Vilaine, on the E. by Maine-et-Loire, and on the S. by Vendée. Its greatest length from east to west is 76 miles, its greatest breadth 65 miles, and its area 2693 square miles. The surface is very flat, and the highest point, in the north on the borders of Ille-et-Vilaine, is only 377 feet. The line of hillocks skirting the right bank of the Loire, and known as the "sillon de Bretagne," nowhere attains a height of 265 feet; below Savenay they recede from the river, and the meadows give place to peat bogs. North of St. Nazaire the Grande Brière, measuring 9 miles by 6, and rising scarcely 10 feet above the sea-level, still supplies old trees which can be used for joiner work; a few scattered villages occur on the more elevated spots, but communication is effected chiefly by means of the canals which intersect it. The district on the south of the Loire lies equally low; its most salient feature is the lake of Grandlieu, covering an area of 27 square miles, and surrounded by low and marshy ground, but so shallow (6·5 feet at most) that drainage would be comparatively easy. The Loire has a course of 68 miles within the department; its width above Nantes varies from 1300 to 3280 feet, and its volume at Nantes, where the tide begins to be felt, is never under 700 cubic metres per second. It has numerous islands. At Paimbœuf it is nearly 2 miles broad, but narrows again opposite St. Nazaire before finally entering the ocean. The bed is not sufficiently regular to allow easily the passage of vessels drawing more than 10 feet of water. On the left bank a canal of 9 miles is about to be opened between Pellerin, where the dikes which protect the Loire valley from inundation terminate, and Paimbœuf. The principal towns on the river within the department are Ancenis, Nantes, and St. Nazaire (one of the most important commercial ports of France) on the right, and Paimbœuf on the left. The chief affluents are on the right the Erdre and on the left the Sèvre, both debouching at Nantes. The Erdre has a succession of broad lakes which give it the appearance of a first class river; it forms part of the canal from Nantes to Brest. The Sèvre, on the other hand, is hemmed in by picturesque hills; at the point where it enters the department it flows past the famous castle of Clisson. Apart from the Loire itself, the only navigable channel of importance within the department is the Nantes and Brest canal already referred to, fed by the Isac, a tributary of the Vilaine, which separates Loire-Inférieure from Ille-et-Vilaine and Morbihan. The climate partakes of the general Armorican character in respect of humidity, but is Girondine in its mildness. At Nantes the mean annual temperature is 54°·7 Fahr., and there are one hundred and twenty-two rainy days, the annual rainfall being 25·6 inches. Of the entire area nearly two-thirds is arable; one-seventh is occupied by meadows; and vineyards, woods, heath, lakes, pools, and marshes occupy the remainder.

The quantity of live stock is considerable:—320,000 horned cattle, 180,000 sheep, 80,000 pigs, 38,000 horses, asses, and mules. Poultry also is reared, and there is a good deal of bee-keeping. Wheat, rye, buckwheat, oats, and potatoes are produced in great abundance; leguminous plants are also largely cultivated, especially near Nantes. Beetroot, hemp, and chestnuts represent, along with wine and cider, the chief remaining agricultural products. The woods are of oak in the interior and pine on the coast. The department has deposits of tin, lead, and iron, which are hardly wrought, if at all. North-west from Ancenis a little anthracite is obtained from a coal-bed which is a prolongation of that of Anjou. The salt marshes, about 6000 acres in all, occur for the most part between the mouth of the Vilaine and the Loire, and on the Bay of Bourgneuf. The salt manufacture, which as late as 1874 produced 43,475 tons, is now decaying. There are slate quarries in the north-east of the department, and the granite of the

sea-coast and of the Loire up to Nantes is quarried for large blocks, while the limestone about Châteaubriant occupies numerous kilns. The industries of the department are well developed: steam-engines are built for Government at Indret, a few miles below Nantes; the forges of Basse-Indre are in good repute for the quality of their iron; and the production of the lead-smelting works at Couëron amounts to several millions of francs annually. There are also considerable foundries at Nantes, Chantenay, and St. Nazaire, and shipbuilding yards at Nantes, St. Nazaire, Paimbœuf, and Croisic. Among other industries may be mentioned the preparation of pickles and preserved meats at Nantes, the curing of sardines at Croisic and in the neighboring communes, salt-refining, the great sugar refinery at Nantes, and the tobacco manufacture also there. Fishing is prosecuted along the entire coast. Nantes, formerly one of the most important of French ports, has now given way before St. Nazaire, the trade of which in 1878 exceeded 1,500,000 tons. The principal imports are coal, colonial wares, wood, metals, manure; the exports are wine, salt, preserved meats and pickles, flour, refined sugar, and butter. The department is divided into five arrondissements—Nantes, Ancenis, Châteaubriant, Paimbœuf, and St. Nazaire; Nantes is the capital. The population in 1876 was 612,972, an increase of 243,667 since 1801. Pop. in 1901, 664,971.

LOIRET, a department of central France, made up of three districts of the ancient province of Orléanais,—Orléanais proper, Gâtinais, and Dunois,—together with portions of the Isle of France and Berri, lies between 47° 30′ and 48° 20′ N. lat. and between 1° 30′ and 3° 8′ E. long., and is bounded on the N. by Seine-et-Oise, on the N. E. by Seine-et-Marne, on the E. by Yonne, on the S. by Nièvre and Cher, on the S. W. by Loir-et-Cher, and on the N. W. by Eure-et-Loir; its greatest length, from north-west to south-east, is 75 miles, its greatest breadth, from north to south along the meridian of Paris, 50 miles, and its area 2629 square miles. The name is derived from the Loiret, a stream which issues from the ground some miles to the south of Orleans, and after a course of about 7 miles falls into the Loire; its large volume gives rise to the belief that it is a subterranean branch of that river. The Loire traverses the department by a broad valley which, though frequently devastated by disastrous floods, is famed for its rich tilled lands, its castles, its towns, and its vine-clad slopes. To the right of the Loire are Gâtinais (capital Montargis) and Beauce; the former district is so named from its *gâtines* or wildernesses, of which saffron is, along with honey, the most noteworthy product; Beauce, on the other hand, a monotonous tract of corn-fields without either tree or river, has been called the granary of France. Between Beauce and the Loire is the extensive forest of Orleans, which is slowly disappearing before the advances of agriculture. South of the Loire is Sologne, long barren and unhealthy from the impermeability of its subsoil, but undergoing gradual improvement in both respects by means of pine plantation and draining and manuring operations. The surface of the department presents little variation of level; the highest point (on the borders of Cher), is 900 feet above the level of the sea, and the lowest (on the borders of Seine-et-Marne) is 220 feet. The watershed on the plateau of Orleans between the basins of the Seine and Loire, which divide Loiret almost equally between them, is almost imperceptible. The lateral canal of the Loire from Roanne stops at Briare; from the latter town a canal connects with the Seine by the Loing valley, which is joined by the Orleans canal at Montargis. The only important tributary of the Loire within the department is the Loiret; the Loing, a tributary of the Seine, has a course of 40 miles from south to north, and is accompanied throughout first by the Briare canal and afterwards by that of Loing. The Essonne, another important affluent of the Seine, entering Loiret at Malesherbes, takes its rise on the plateau of Orleans, as also does its tributary the Juine. The department has the climate of the Sequanian region, the mean temperature being almost the same as that of Paris; the number of rainy days is one hundred and twenty, and the rainfall varies from 18·5 to 27·5 inches according to the district, that of the exposed Beauce being smaller than that of the woody Sologne. Two-thirds of the entire area is cultivable; between one-sixth and one-seventh is under wood; vineyards occupy one-twentieth; and the remainder is taken up by meadows, heath, and marsh.

A large number of sheep, cattle, horses, asses, pigs, and goats are reared; poultry, especially geese, and bees are plentiful. The yield of wheat and oats is much in excess of the consumption; the crops of rye, barley, meslin, potatoes, beetroot, colza, and hemp are also very important. Wine is abundant, but of inferior quality. Buckwheat supports bees by its flowers, and poultry by its seeds. Saffron is another source of wealth. The woods consist of oak, elm, birch, and pine; fruit trees thrive in the department, and Orleans is a great centre of nursery gardens. The industries are brick and tile making, and the manufacture of faience, for which Gien is one of the most important centres in France. The Briare manufacture of porcelain buttons and pearls employs 1500 workmen. Flour-mills are very numerous. There are iron and brass foundries, which, along with agricultural implement making, bell-founding, and the manufacture of pins, nails, and files, represent the chief metal-working industries. The production of hosiery, wool-spinning, and various forms of wool manufacture are also engaged in. A large quantity of the wine grown is made into vinegar (vinaigre d'Orléans). The tanneries produce excellent leather; and paper-making, sugar-refining, wax-bleaching, and the manufacturing of caoutchouc (in one factory) complete the list of industries. The exports are principally corn, flour, wine, vinegar, live-stock, and wood. The four arrondissements are those of Orleans, Gien, Montargis, and Pithiviers. The capital is Orleans. The population in 1876 was 360,903, an increase of 70,764 since 1801; in 1901,366,666.

LOIR-ET-CHER, a department of central France, consists of a small portion of Touraine, but chiefly of portions of Orléanais proper, Blésois, and Dunois, districts which themselves formerly belonged to Orléanais. It lies between 47° 11′ and 48° 8′ N. lat. and between 0° 35′ and 2° 15′ E. long., and is bounded on the N. by Eure-et-Loir, on the N. E. by Loiret, on the S. E. by Cher, on the S. by Indre, on the S. W. by Indre-et-Loire, and on the N. W. by Sarthe, the greatest length (north-west to south-east) being 78 miles, maximum breadth 31 miles, and the area 2478 miles. Its name is derived from the Loir and the Cher, by which it is traversed in the north and in the south respectively. The Loire divides it into two nearly equal portions, the district on the right of the Loire being known as Beauce, while that on the right of the Loir again is called Perche; on the left of the Loire is Sologne. The surface of Perche is varied, and reaches a maximum height of 840 feet; its woods alternate with hedged fields and orchards, and rapid rivulets water the green valleys. Beauce is a rich agricultural country, where the monotony of the endless fields of corn is broken only by the houses grouped together in villages, or by the stacks which surround them. Sologne was formerly a region of forests, of which that of Chambord is one of the last remains. Its soil, formerly barren and unhealthy, has been considerably improved within recent years. The Cher and Loir traverse pleasant valleys, occasionally bounded by walls of tufa, in which numerous dwellings have been excavated; the stone extracted, after hardening by exposure to the air, has been used for building purposes in the nearer towns. Within the department the Loir has a course of 56 miles, the Cher of 50, and the Loire of 37. With the help of the Berri canal the last-mentioned is navigable throughout. The chief remaining rivers of the department are the Beuvron, which flows into the Loire on the left, and the Sauldre on the right of the Cher. All these named have a south-westerly course, following the slope of the department. The climate is temperate and mild, and healthy if Sologne be left out of account. The mean temperature ranges between 52° and 53° Fahr., and the rainfall is 25·4 inches. Of the total area more than a half is arable; one-sixth is under wood, and one-sixth is waste; vineyards, meadows, and pasture lands occupy the remainder.

Sheep are extensively reared, and the Perche breed of horses is much sought after for its combination of lightness with strength. There are more than twenty thousand beehives within the department. Beauce is the most productive district; in 1878 it yielded 342,000 quarters of wheat, 556,000 of oats, and 1,500,000 bushels of potateos, besides meslin, rye, barley, buckwheat, beetroot, maize, colza, and hemp. In the same year the production of wine amounted to 27,000,000 gallons, the most valuable being that of Côte du Cher. The forests are an important source of wealth. Sologne supplies pine and birchwood for furnace fuel, and in the neighborhood of Blois there are oak, elm, and chestnut plantations. In the river valleys fruit trees and nursery gardens are numerous. Formerly the specialty of Loir-et-Cher was to supply Europe with gun flints. Building stones, and also clay for bricks and pottery, are also abundant. The chief industries are the manufacture of cloth at Romorantin (where spinning, ribbon-making, and tanning are also carried on), of white leather and gloves at Vendôme, distilling, glass-making, paper-making, pottery-making, and the like. The exports are wine, brandy, vinegar, wood, cloth, wool, leather, grain, legumes, wax, and leeches. Of the castles which adorn the department the finest and most famous is that of Chambord, near the left bank of the Loire, opposite Blois (the capital). The three arrondissements are those of Blois, Romorantin, and Vendôme. In 1876 the population was 272,634, an increase of 55,721 since 1801; in 1901, 275,538.

LOJA, or Loxa, a town of Spain in the province of Granada, lies in a beautiful valley through which flows the Genil, here crossed by a Moorish bridge, about 33 miles by rail west from Granada. The situation is very steep, and the streets in consequence are extremely crooked and irregular. The castle stands on a rock in the centre of the town, which, from being the key to Granada, was once a place of great military importance. The manufactures of Loja consist chiefly of coarse woollens, silk, paper, and leather. Salt is obtained in the neighborhood. The population in 1897 was 18,174.

Loja, which has sometimes been identified with the ancient *Ilipula*, or with the *Lacibi* (*Lacibis*) of Pliny and Ptolemy, first clearly emerges in the Arab chronicles of the year 890. It was taken by Ferdinand III. in 1226, but was soon afterwards abandoned, and did not finally fall under the arms of Castile until May 28, 1486, when it surrendered to Ferdinand and Isabella after a siege.

LOKEREN, a town of Belgium, in the province of East Flanders and district of Termonde, on the Durme (a small but navigable stream by which it communicates with the Scheldt), and 11 miles from Ghent on the railway to Antwerp, which is there joined by the lines to Termonde and Alost, and to Selzaete. It is a busy manufacturing place, with cotton factories, ropewalks, and bleach-works, etc. The church of St. Lawrence (17th century) has a fine pulpit, representing Jesus in the midst of the doctors. The population of the commune has increased from 11,960 in 1808 to 20,998 in 1900.

LOḲMÁN, a name famous in Arabian tradition. The Arabs distinguish two persons of this name. The older Loḳmán was an 'Ádite, and is said to have built the famous dyke of Ma'rib. He not only escaped the destruction sent on his nation for their refusal to hear the prophet Húd, but received the gift of a life as long as that of seven vultures, each of which is said to have lived eighty years.[1] The other Loḳmán, called "Loḳmán the Sage," is mentioned in the Koran (xxxi. 11). He is said to have been a Nubian slave, son of 'Anḳá, and to have lived in the time of David in the region of Elah and Midian (Maṣúdy, i. 110), but the commentators on the Koran (Abu Sá'úd, ii. 336) make him son of Bá'úrá, the son of Job's sister or daughter. This form of the legend, and many of the stories told of him (D'Herbelot, *s. v.*, but not those given by Nawawy, p. 526), show Jewish influence on the legend, and Darenbourg (*Fables de Loqmân le sage*, 1850) has pointed out that Bá'úrá seems to be identical with Beor, and that Loḳmán corresponds to Balaam, the roots of both names meaning "to swallow," so that the one may be viewed as a translation of the other. In favor of this identification Derenbourg advances several important and probably conclusive arguments from Jewish tradition; but in view of the divergent accounts given of Loḳmán it may be questioned whether Jewish influence created or only modified the Arabic tradition. The grave of Loḳmán was shown on the east coast of the Lake of Tiberias, but also in Yemen and elsewhere (Yáḳút, iii. 512; D'Herbelot, *s. v.*).

[1] Tabary, i. 240; Abulf., *H. A.*, 20; Damíry, ii. 384. The tradition has various forms. Maṣúdy, iii. 366, 375, gives Loḳmán only the age of one vulture. Further details are given by Caussin de Perceval, *Essai*. The vultures of Loḳmán, especially the seventh, whose name was Lobad, are often referred to in Arabic poetry and proverbs.

The name of Loḳmán is associated with numerous old verses, proverbs, and anecdotes of which Freytag, *Arabum Proverbia*, gives many examples. The fables which pass under his name, and were first printed by Erpenius (Leyden, 1615), are not mentioned by any Arabic writer. They appear to be of Christian origin, and are mainly derived, though not closely copied, from those of Syntipas and Æsop. They existed in the 13th century (Derenbourg, *ut supra*). The editions are numerous, the book having been much used as an elementary Arabic reading-book. Those of Rödiger (2d ed. 1839, with glossary) and Derenbourg (1850) claim special mention.

LOLLARDS, The, were the English followers of John Wickliffe, and were the adherents of a religious movement which was widespread in the end of the 14th and beginning of the 15th centuries, and which to some extent maintained itself on to the Reformation. The name is of uncertain origin: it has been traced to a certain Walter Lollard, but he was probably a mythical personage; some derive it from *lolium*, tares, quoting Chaucer (*C. T.*, Shipman's Prologue)—

> "This Lollere here wol prechen us somwhat . . .
> He wolde sowen some difficulte
> Or sprengen cokkle in oure clene corn;"

but the most generally received explanation derives the words from *lollen* or *lullen*, to sing softly. The word is much older than its English use; there were Lollards in the Netherlands as early as the beginning of the 14th century, who were akin to the Fratricelli, Beghards, and other sectaries of the recusant Franciscan type. The earliest official use of the name in England occurs in 1387 in a mandate of the bishop of Worcester against five "poor preachers," *nomine seu ritu Lollardorum confœderatos*. It is probable that the name was given to the followers of Wickliffe because they resembled those offshoots from the great Franciscan movement which had disowned the pope's authority and separated themselves from the mediæval church. The 14th century, so full of varied religious life, made it manifest that the two different ideas of a life of separation from the world which in earlier times had lived on side by side within the mediæval church were irreconcilable. The church chose to abide by the idea of Hildebrand and to reject that of Francis of Assisi; and the revolt of Ockham and the Franciscans, of the Beghards and other spiritual fraternities, of Wickliffe and the Lollards, were all protests against that decision. Hildebrand's object was to make church government or polity in all respects distinct from civil government—no civil ruler to touch churchman or church possession for trial or punishment, taxation or confiscation; and, in the hands of his successors, who followed out his principles, the church became transformed into an empire in rivalry with the kingdoms, and of somewhat the same kind, only that its territories were scattered over the face of Europe in diocesan domains, convent lands, or priests' glebes. its taxes were the tithes, its nobles the prelates. Francis of Assisi had another ideal. Christians, he thought, could separate themselves from the world, in imitation of Christ, by giving up property, and home, and country, and going about doing good and living on the alms of the people. For a time these two ways of separation from the world lived on side by side in the church, but they were really irreconcilable; Hildebrand's church required power to enforce her claims, and money, land, position

were all sources of power. Church rulers favored the friars when they found means of evading their vows of absolute poverty, and gradually there came to be facing each other in the 14th century a great political Christendom, whose rulers were statesmen, with aims and policy of a worldly ambitious type, and a religious Christendom, full of the ideas of separation from the world by self-sacrifice and of participation in the benefits of Christ's work by an ascetic imitation, which separated itself from political Christianity and called it anti-Christ. Wickliffe's whole life was spent in the struggle, and he bequeathed his work to his followers the Lollards. The main practical thought with Wickliffe was that the church, if true to her divine mission, must aid men to live that life of evangelical poverty by which they could be separate from the world and imitate Christ, and if the church ceased to be true to her mission she ceased to be a church. Wickliffe was a metaphysician and a theologian, and had to invent a metaphysical theory—the theory of *Dominium*—to enable him to transfer, in a way satisfactory to himself, the powers and privileges of the church to his company of poor Christians; but his followers who were not troubled with need of theories, were content to allege that a church which held large landed possessions, collected tithes greedily, and took money from starving peasants for baptizing, burying, and praying, could not be the church of Christ and his apostles, who in poverty went about doing good.

Lollardy was most flourishing and most dangerous to the ecclesiastical organization of England during the ten years after Wickliffe's death. It had spread so rapidly and grown so popular that a hostile chronicler could say that almost every second man was a Lollard. Wickliffe left three intimate disciples:—Nicolas Hereford, a doctor of theology of Oxford, who had helped his master to translate the Bible into English; John Ashton, also a fellow of an Oxford college; and John Purvey, Wickliffe's colleague at Lutterworth, and a co-translator of the Bible. With these were associated more or less intimately, in the first age of Lollardy, John Parker, the strange ascetic William Smith, the restless fanatic Swynderly, Richard Waytstract, and Crompe; and there must have been a large number of preachers who itinerated through England preaching the doctrines of their master. Wickliffe had organized in Lutterworth an association for sending the gospel through all England, a company of poor preachers somewhat after the Wesleyan method of modern times. "To be poor without mendicancy, to unite the flexible unity, the swift obedience of an order, with free and constant mingling among the poor, such was the ideal of Wickliffe's 'poor priests'" (*cf.* Shirley, *Fasc. Ziz.*, p. xl.), and, although proscribed, these "poor preachers," with portions of their master's translation of the Bible in their hand to guide them, preached all over England wherever they could be heard without detection. The Oxford university and many nobles supported them. Lord Montacute, Lord Salisbury, Sir Thomas Latimer of Braybrooke, and several others had chaplains who were Lollardist preachers; whilst many merchants and burgesses assisted the work with money. The organization must have been strong in numbers, but only the names of those have come down to us who were seized for heresy, and it is only from the indictments of their accusers that their opinions can be gathered. The preachers were picturesque figures in long russet dress down to the heels, who, staff in hand, preached in the mother tongue to the people in churches and graveyards, in squares, streets, and houses, in gardens and pleasure grounds, and then talked privately with those who had been impressed. The Lollard literature was very widely circulated,—books by Wickliffe and Hereford and tracts and broadsides,—in spite of many edicts proscribing it. In 1395 the Lollards grew so strong that they petitioned parliament through Sir Thomas Latimer and Sir R. Stury to reform the church on Lollardist methods. It is said that the Lollard Conclusions printed by Canon Shirley (p. 360) contain the substance of this petition If so, parliament was told that temporal possessions ruin the church and drive out the Christian graces of faith, hope, and charity; that the priesthood of the church in communion with Rome was not the priesthood Christ gave to his apostles; that the monk's vow of celibacy had for its consequence unnatural lust, and should not be imposed; that transubstantiation was a feigned miracle, and led people to idolatry; that prayers made over wine, bread, water, oil, salt, wax, incense, altars of stone, church walls, vestments, mitres, crosses, staves, were magical and should not be allowed; that kings should possess the *jus episcopale*, and bring good government into the church; that no special prayers should be made for the dead; that auricular confession made to the clergy, and declared to be necessary for salvation, was the root of clerical arrogance and the cause of indulgences and other abuses in pardoning sin; that all wars were against the principles of the New Testament, and were but murdering and plundering the poor to win glory for kings; that the vows of chastity laid upon nuns led to child murder; that many of the trades practised in the commonwealth, such as those of goldsmiths and armorers, were unnecessary and led to luxury and waste. These Conclusions really contain the sum of Wickliffite teaching; and, if we add that the principal duty of priests is to preach, and that the worship of images and going on pilgrimages are sinful, they include almost all the heresies charged in the indictments against individual Lollards down to the middle of the 15th century. The king, who had hitherto seemed anxious to repress the action of the clergy against the Lollards, spoke strongly against the petition and its promoters, and Lollardy never again had the power in England which it wielded up to this year.

If the formal statements of Lollard creed are to be got from these Conclusions, the popular view of their controversy with the church may be gathered from the ballads preserved in the collection of *Political Poems and Songs relating to English History*, published in 1859 by Mr. Thomas Wright for the Master of the Rolls series, and in the Piers Ploughman poems. *Piers Ploughman's Creed* (see LANGLAND) was probably written about 1394, when Lollardy was at its greatest strength; the ploughman of the *Creed* is a man gifted with sense enough to see through the tricks of the friars, and with such religious knowledge as can be got from the creed, and from Wickliffe's version of the Gospels. The poet gives us a "portrait of the fat friar with his double chin shaking about as big as a goose's egg, and the ploughman with his hood full of holes, his mittens made of patches, and his poor wife going barefoot on the ice so that her blood followed" (*Early English Text Society*, vol. xxx., pref., p. 16); and one can easily see why farmers and peasants turned from the friars to the poor preachers. The *Ploughman's Complaint* tells the same tale. It paints popes, cardinals, prelates, rectors, monks, and friars, who call themselves followers of Peter and keepers of the gates of heaven and hell, and pale poverty-stricken people, cotless and landless, who have to pay the fat clergy for spiritual assistance, and asks if these are Peter's priests after all. "I trowe Peter took no money, for no sinners that he sold. . . . Peter was never so great a fole, to leave his key with such a losell."

In 1399 the Lancastrian Henry IV. overthrew the Plantagenet Richard II., and one of the most active partisans of the new monarch was Arundel, archbishop of Canterbury and the most determined opponent of Lollardy. It has been alleged that Henry won his help by promising to do his utmost to suppress the followers of Wyclif, and this much is certain, that when the house of Lancaster was firmly established upon the throne the infamous Act *De Comburendo hereticos* was passed in 1400, and church and state combined to crush the Lollards. John Purvey was seized; William Sautrey (Chartris) was tried, condemned, and burned. The Lollards, far from daunted, abated no effort to make

good their ground, and united a struggle for social and political liberty to the hatred felt by the peasants towards the Romish clergy. Jack Upland (John Countryman) took the place of Piers Ploughman, and upbraided the clergy, and especially the friars, for their wealth and luxury. Wickliffe had published the rule of St. Francis, and had pointed out in a commentary upon the rule how far friars had departed from the maxims of their founder, and had persecuted the *Spirituales* (the Fratricelli, Beghards, Lollards of the Netherlands) for keeping them to the letter (*cf.* Matthews, *English Works of Wyclif hitherto unprinted*, Early Eng. Text Soc., vol. lxxiv., 1880). Jack Upland put all this into rude nervous English verse:—

"Freer, what charitie is this
To fain that whoso livoth after your order
Liveth most perfectlie,
And next followeth the state of the Apostles
In povertie and pennance:
And yet the wisest and greatest clerkes of you
Wend or send or procure to the court of Rome,
. . . and to be assoiled of the vow of povertie."

The archbishop, having the power of the state behind him, attacked that stronghold of Lollardy the university of Oxford. In 1406 a document appeared bearing to be the testimony of the university in favor of Wickliffe; its genuineness was disputed at the time, and when quoted by Huss at the council of Constance it was repudiated by the English delegates. The archbishop treated Oxford as if it had issued the document, and procured the issue of severe regulations in order to purge the university of heresy. In 1408 Arundel in convocation proposed and carried the famous *Constitutiones Thomæ Arundel* intended to put down Wickliffite preachers and teaching. They provided amongst other things that no one was to be allowed to preach without a bishop's license, that preachers preaching to the laity were not to rebuke the sins of the clergy, and that Lollard books and the translation of the Bible were to be searched for and destroyed. He next attempted to purge the nobility of Lollardy. The earlier leaders had died, but there was still one distinguished Lollard, Sir John Oldcastle, in right of his wife Lord Cobham, "the good Lord Cobham" of the common people, who had been won to pious living by the poor preachers, and who openly professed the common Lollard doctrines. His chaplain, one of the itinerating preachers, was seized, then his books and papers were taken and burnt in the king s presence, and later he was indicted for heresy. It is said that at first he recanted, but the abjuration, said to be his, may not be authentic. In the end he was burnt for an obstinate heretic. These persecutions were not greatly protested against; the wars of Henry V. with France had awakened the martial spirit of the nation, and little sympathy was fel for men who had declared that all war was but the murder and plundering of poor people for the sake of kings. Mocking ballads were composed upon the martyr Oldcastle, and this dislike to warfare was one of the chief accusations made against him (comp. Wright's *Political Poems*, vol. ii. p. 244). But Arundel could not prevent the writing and distribution of Lollard books and pamphlets. Two appeared just about the time of the martyrdom of Oldcastle—The *Ploughman's Prayer* and the *Lanthorne of Light*. The *Ploughman's Prayer* declared that true worship consists in three things—in loving God, and dreading God, and trusting in God above all other things; and it showed how Lollards, pressed by persecution, became further separated from the religious life of the church. "Men maketh now great stonen houses full of glassen windows, and clepeth thilke thine houses and churches. And they setten in these houses mawmets of stocks and stones, to fore them they knelen privilich and apert, and maken their prayers, and all this they say is thy worship. . . . For Lorde our belief is that thine house is man's soul."

The council of Constance (1414–1418) put an end to the papal schism, and also showed its determination to put down heresy by burning John Huss. When news of this reached England the clergy were incited to still more vigorous proceedings against Lollard preachers and books. From this time Lollardy appears banished from the fields and streets, and takes refuge in houses and places of concealment. There was no more wayside preaching, but instead there were *conventicula occulta* in houses, in peasants' huts, in sawpits, and in field ditches, where the Bible was read and exhortations were given, and so Lollardy continued. In 1428 Archbishop Chichele confessed that the Lollards seemed as numerous as ever, and that their literary and preaching work went on as vigorously as before. It was found out also that many of the poorer rectors and parish priests, and a great many chaplains and curates, were in secret association with the Lollards, so much so that in many places processions were never made and worship on saints' days was abandoned. For the Lollards if not stamped out were hardened by persecution, and became fanatical in the statement of their doctrines. Thomas Bagley was accused of declaring that if in the sacrament a priest made bread into God, he made a God that can be eaten by rats and mice; that the pharisees of the day, the monks, and the nuns, and the friars, and all other privileged persons recognized by the church, were limbs of Satan; and that auricular confession to the priest was the will not of God but of the devil. And others held that any priest who took salary was excommunicate; and that boys could bless the bread as well as priests.

From England Lollardy passed into Scotland. Oxford infected St. Andrews, and we find traces of more than one vigorous search made for Lollards among the teaching staff of the Scottish university, while the Lollards of Kyle in Ayrshire were claimed by Knox as the forerunners of the Scotch Reformation.

The opinions of the later Lollards can best be gathered from the learned and unfortunate Pecock, who wrote his elaborate *Repressor* against the "Bible-men," as he calls them. He summed up their doctrines under eleven heads: they condemn the having and using images in the churches, the going on pilgrimages to the memorial or "mynde places" of the saints, the holding of lauded possessions by the clergy, the various ranks of the hierarchy, the framing of ecclesiastical laws and ordinances by papal and episcopal authority, the institution of religious orders, the costliness of ecclesiastical decorations, the ceremonies of the mass and the sacraments, the taking of oaths, and the maintaining that war and capital punishment are lawful. When these points are compared with the Lollard Conclusions of 1395, it is plain that Lollardy had not greatly altered its opinions after fifty-five years of persecution. All the articles of Pecock's list, save that on capital punishment, are to be found in the Conclusions; and, although many writers have held that Wickliffe's own views differed greatly from what have been called the "exaggerations of the later and more violent Lollards," all these views may be traced back to Wickliffe himself. Pecock's idea was that all the statements which he was prepared to impugn came from three false opinions or "trowings," viz, that no governance or ordinance is to be esteemed a law of God which is not founded on Scripture, that every humble-minded Christian man or woman is able without "fail and defaut" to find out the true sense of Scripture, and that having done so he ought to listen to no arguments to the contrary; he elsewhere adds a fourth (vol. i. p. 102), that if a man be not only meek but also keep God's law he shall have a true understanding of Scripture, even though "no man ellis teche him saue God." These statements, especially the last, show us the connection between the Lollards and those mystics of the 14th century, such as Tauler and Ruysbroeck, who accepted the teachings of Nicholas of Basel, and formed themselves into the association of the Friends of God.

The question remains—What was the connection between the Lollard movement and the Reformation in England? Many writers make Lollardy the forerunner of Reformation teaching; others, like Mr. Gairdner, relying on the facts that the persecution of the Lollards did not rouse the English nation in the way that the martyrdom of Huss excited the Bohemians, and that Lollardy had almost faded out of sight in the beginning of the 16th century, admit only a casual connection between the two awakenings.

The problem is scarcely one which can be settled by counting the numbers of Lollards convicted at different periods from the beginning to the end of the 15th century, or by pointing to the enthusiasm or indifference of the mass of the English nation to Lollard doctrines. The English Reformation down to the middle of Elizabeth's reign was much more a political than a religious movement with the great proportion of English people. Lollardy in its most essential and invariable characteristics had much more in common with mediæval religious revivals than with Reformation piety, and Lollard preaching must have had much more resemblance to that of Ockham and his recusant Franciscans than that of Luther, Calvin, or Peter Martyr. But Lollardy did one thing for England which other mediæval revivals did not do for the lands in which they arose; it made the Bible familiar to the people in their mother tongue, and this must have been a positive preparation for the English Reformation of no ordinary power. May not the great peculiarity of the English Reformation on its religious side, the repeated attempts to give a good version of the Bible from the original tongues into English, by Tyndale, Coverdale, Taverner, Cranmer, the Genevan refugees, and Parker, with the revisions and combinations of these various translations, on to our present authorized version, have come from the fact that Lollard Biblemen, as Pecock calls them, had made a good English Bible a necessity for an English reformation of religion?

LOMBARD, Peter (*c.* 1100–1160), bishop of Paris, better known as *Magister Sententiarum*, the son of obscure parents, was born about the beginning of the 12th century, at Novara (then reckoned as belonging to Lombardy). After receiving his education in jurisprudence and the liberal arts at Bologna, he removed to France, bearing a recommendation to Bernard of Clairvaux, who first placed him under Lotolf at Rheims, and afterwards sent him to Paris with letters to Gilduin, the abbot of St. Victor. His diligence and talents soon brought him into notice, and ultimately obtained for him a theological chair, which he held for a number of years; during this period he is said to have been the first to introduce theological degrees. On June 29, 1159, he succeeded his former pupil, Philip, brother of Louis VII., in the bishopric of Paris, but did not long survive the promotion; according to the most trustworthy of the meagre accounts we have of his life, he died on July 20 of the following year.

His famous theological handbook, *Sententiarum Libri Quatuor*, is, as the title implies, primarily a collection of "senteutiæ patrum." These are arranged (professedly on the basis of the aphorism of Augustine, Lombard's favorite authority, that "omnis doctrina vel rerum est vel signorum") into four books, of which the first treats of God, the second of the creature, the third of the incarnation, the work of redemption, and the virtues, and the fourth of the seven sacraments and eschatology. It soon attained immense popularity, ultimately becoming the text-book in almost every theological school, and giving rise to endless commentaries. A charge of heresy ("nihilianism") was indeed raised against Lombard for a particular view which he seemed not remotely to have indicated regarding Christ's human nature, but neither at the synod of Tours, where the question was first broached in 1163, nor at the subsequent Lateran synod in 1179, does a condemnation seem to have been obtained. In 1300 the theological professors of Paris agreed in the rejection of sixteen propositions taken from Lombard, but their decision was far from obtaining universal currency.

Besides the *Sententiæ*, Lombard wrote numerous commentaries (*e. g.*, on the Psalms, Canticles, Job, the Gospel Harmony, and the Pauline Epistles), sermons and letters, which still exist in MS. The *Glossæ seu Commentarius in Psalmos Davidis*, first published at Paris in 1533, and the *Collectanea in omnes D. Pauli Epistolas* (Paris, 1535) have been reprinted by Migne.

LOMBARDS. The history of the Lombards falls into three divisions:—(1) The period before the invasion in 568 A. D.; (2) the Lombard kingdom in Italy between 568 and 774; (3) the period of their incorporation with the Italian population, and the history of Lombardy and its cities as one of the great provinces of Italy—(*a*) from the restoration of the empire under Charles the Great (800) to the peace of Constance with Frederick Barbarossa (1183), and (*b*) from the declaration of independence to the time of the tyrannies and, afterwards, of the French, Spanish, and Austrian rule.

1. The name *Lombard* is the Italianized form of the national name of a Teutonic tribe, *Longobardi*, itself an Italian arrangement, based on a supposed etymology of the Teutonic *Langbard*, *Langobardi*, the form used when they are first named by Roman writers—Velleius and Tacitus. The etymology which made the name mean *Longbeard* is too obvious not to have suggested itself to Italians, and perhaps to themselves (see Zeuss, 95, 109;) it is accepted by their first native chronicler, Paul the Deacon, who wrote in the time of Charles the Great. But the name has also been derived from the region where they are first heard of. On the left bank of the Elbe, "where Börde or Bord still signifies a fertile plain by the side of a river," a district near Magdeburg is still called the *Lange Börde;* and lower down the Elbe, on the same side, about Lüneburg, the *Bardengau*, with its *Bardewik*, is still found; it is here that Velleius, who accompanied Tiberius in his campaign in this part of Germany, and who first mentions the name, places them. As late as the age of their Italian settlement, the Lombards are called *Bardi* in poetical epitaphs, though this may be for the convenience of metre.

Their own legends bring the tribe as worshippers of Odin from Scandinavia to the German shore of the Baltic, under the name of *Winili*, a name which was given to them in a loose way as late as the 12th century (*e. g.*, by Ordericus Vitalis; *cf.* Zeuss, 57). By the Roman and Greek writers of the first two centuries of our era they are spoken of as occupying, with more or less extension at different times, the region which is now Hanover and the Altmark of Prussia. To the Romans they appeared a remarkable tribe:—"gens etiam Germana feritate ferocior," says Velleius, who had fought against them under Tiberius; and Tacitus describes them as a race which, though few in numbers, more than held their own among numerous powerful neighbors by their daring and love of war. In the quarrels of the tribes they appear to have extended their borders; in Ptolemy's account of Germany, in the 2d century, they fill a large space among the races of the north-west and north. But from the 2d century the name disappears,[1] till it is found again at the end of the 5th century as that of a half Christian tribe on the northern banks of the Danube. How they got there, and what relation these Langobards bore to those who lived in the 1st and 2d centuries on the west bank of the Elbe, we learn little from the vague stories preserved by their traditions; but they are described (*B. G.*, ii. 14, 15) by Procopius, a contemporary, as subject to one of the most ferocious of the tribes on the Danube, the Heruli, also a Teutonic tribe, by whose oppression they were driven in despair to a resistance, which ended in the utter defeat and overthrow of their tyrants. We know nothing of the way in which Christianity was introduced among them, probably only among some of their noble families; but they were Arians like their neighbors and predecessors in Italy, the Goths, and like them they brought with them into Italy a hierarchy of bishops, priests, and deacons; but, while the Gothic Bible of Ulfilas is partially preserved, whatever religious literature the Langobards had in the shape of versions of the Scriptures or liturgical forms has utterly perished. They were among the Teutonic tribes which were generally on good terms with the empire, and were encouraged by it in their wars with their more barbarous neighbors. After defeating the Heruli and destroying their tribal organization, the Langobards attacked the Gepidæ with equal success, scattering the

[1] Except in the Anglo-Saxon *Traveller's Song*, of probably between 375–435; see Guest's *English Rhythms*, 2, 77, 83, 87.

tribe or incorporating its survivors in their own host. They thus became the most formidable of the Teutonic tribes of the Danube. They had alliances with the distant Saxons, probably a kindred stock, and with the Hunnish Avars of the Danube. Their kings belonged to a royal line, and made marriages with the kings of the Franks and the other German nations. Their wars led them westwards, and for forty years they are said to have occupied Pannonia, the region between the Danube and the valleys of the Drave and Save. Thus following the line of movement of the Goths, they resolved at last to strike for the great prize which the Goths had won and lost. Through the eastern passes, and the border land of Friuli, they invaded Italy. It is said that they were invited by Narses, the conqueror of the Goths, in revenge for his ill treatment by the masters whom he had served.

2. In 568 Alboin, king of the Langobards, with the women and children of the tribe and all their possessions, with Saxon allies, with the subject tribe of the Gepidæ, and a mixed host of other barbarians, descended into Italy by the great plain at the head of the Adriatic. There was little resistance to them. The war which had ended in the downfall of the Goths had exhausted Italy; it was followed by famine and pestilence; and the Government at Constantinople, away in the East, made but faint efforts to retain the province which Belisarius and Narses had recovered for it. Except in a few fortified places, such as Ticinum or Pavia, the Italians did not venture to encounter the new invaders; and, though Alboin was not without generosity, the Lombards, wherever resisted, justified the opinion of their ferocity by the savage cruelty of the invasion. In 572, according to the tragic tale of the Lombard chronicler, a tale which recalls the story of Candaules in Herodotus, Alboin, the fierce conqueror, fell a victim to the revenge of his wife Rosamond, the daughter of the king of the Gepidæ, whose skull Alboin had turned into a drinking cup, out of which he forced Rosamond to drink; but the Langobards had already shown themselves in ravaging bands all over Italy, and in the north had begun to take possession. Military chiefs, whom, after the Latin writers, we call "dukes," corresponding to the German "Herzog," were placed, or placed themselves, first in the border cities, like Friuli and Trent, which commanded the north-eastern passes, and then in other principal places in Italy; and this arrangement became characteristic of the Lombard settlement. The principal seat of the settlement was the rich plain watered by the Po and its affluents, which was in future to receive its name from them; but their power extended across the Apennines into Liguria and Tuscany, and then southwards to the outlying dukedoms of Spoleto and Benevento. The invaders failed to secure any maritime ports such as Genoa, Pisa, Naples, Salerno, Ravenna, or any territory that was conveniently commanded from the sea. Pavia, or, as it was called, Ticinum, the one place which had obstinately resisted Alboin, became the seat of their kings, as it had been one of the seats of the Gothic kingdom.

After the short and cruel reign of Cleph, the successor of Alboin, the Lombards (as we may begin for convenience sake to call them) tried for ten years the experiment of a national confederacy of their dukes, without any king at their head. It was the rule of some thirty-five or thirty-six petty tyrants, under whose oppression and private wars even the invaders suffered, while the Italians were remorselessly trodden under foot. With anarchy among themselves and so precarious a hold on the country, hated by the Italian population and by their natural leaders the Catholic clergy, threatened also by an alliance of the Greek empire with their natural and persistent rivals the Franks beyond the Alps, they resolved to sacrifice their turbulent independence to the usual necessities of the Teutonic invaders which led to the election of a king. In 584 they chose Authari, the grandson of Alboin, and endowed the royal domain with a half of their possessions. From this time till the fall of the Lombard power before the arms of their rivals the Franks under Charles the Great, the kingly rule continued. Authari, "the Long-haired," with his Roman title of Flavius, marks the change from the war-king of an invading host to the permanent representative of the unity and law of the nation, and the increased power of the crown, by the possession of a great domain, to enforce its will. The independence of the dukes was surrendered to the king. The dukedoms in the neighborhood of the seat of power were gradually absorbed, and their holders transformed into royal officers. Those of the northern marches, Trent and Friuli, with the important dukedom of Turin, retained longer the kind of independence which marchlands usually give where invasion is to be feared. The great dukedom of Benevento in the south, with its neighbor Spoleto, threatened at one time to be a separate principality, and even to the last resisted, with varying success, according to the personal characters of its dukes, the full claims of the royal authority at Pavia.

The kingdom of the Lombards lasted more than two hundred years, from Alboin (568) to the fall of Desiderius (774),—much longer than the preceding Teutonic kingdom of Theodoric and the Goths. But it differed from the other Teutonic conquests in Gaul, in Britain, in Spain. It was never complete in point of territory: there were always two, and almost to the last three, capitals—the Lombard one, Pavia, the Latin one, Rome, the Greek one, Ravenna; and the Lombards never could get access to the sea. And it never was complete over the subject race: it profoundly affected the Italians of the north; in its turn it was entirely transformed by contact with them; but the Lombards never overcame the natural repulsion of the two races, and never amalgamated with the Italians till their power as a ruling race was crushed by the victory given to the Roman element by the restored empire of the Franks. The Langobards, German in their faults and in their strength, but coarser, at least at first, than the Germans whom the Italians had known, the Goths of Theodoric and Totila, found themselves continually in the presence of a subject population very different from anything which the other Teutonic conquerors met with among the provincials,—like them, exhausted, dispirited, unwarlike, but with the remains and memory of a great civilization round them, intelligent, subtle, sensitive, feeling themselves infinitely superior in experience and knowledge to the rough barbarians whom they could not fight, and capable of hatred such as only cultivated races can nourish. The Lombards who came into Italy with the most cruel incidents of conquest, and who, when they had occupied the lands and cities of Upper Italy, still went on sending forth furious bands to plunder and destroy where they did not care to stay, never were able to overcome the mingled fear and scorn and loathing of the Italians. They adapted themselves very quickly indeed to many Italian fashions. Within thirty years of the invasion, Authari took the fancy of decking himself with the imperial title of Flavius, even while his bands were leading Italian captives in leash like dogs under the walls of Rome, and under the eyes of Pope Gregory; and it was retained by his successor. They soon became Catholics; and then in all the usages of religion, in church building, in founding monasteries, in their veneration for relics, they vied with Italians. Authari's queen, Theodelinda, solemnly placed the Lombard nation under the patronage of St. John the Baptist, and at Monza she built in his honor the first Lombard church, and the royal palace near it. King Liutprand (712–744) bought the relics of St. Augustine for a large sum to be placed in his church at Pavia. Their Teutonic speech disappeared; except in names and a few technical words all traces of it are lost. But to the last they had the unpardonable crime of being a ruling barbarian race or caste in Italy. To the end

they are "nefandissimi," execrable, loathsome, filthy. So wrote Gregory the Great when they first appeared. So wrote Pope Stephen IV., at the end of their rule, when stirring up the kings of the Franks to destroy them. Authari's short reign (584–591) was one of renewed effort for conquest. It brought the Langobards face to face, not merely with the emperors at Constantinople, but with the first of the great statesmen popes, Gregory the Great (590–604). But Lombard conquest was bungling and wasteful. It was ever ready to lapse into mere plunder and warfare; and when they had spoiled a city they proceeded to tear down its walls and raze it to the ground. But Authari's chief connection with the fortunes of his people was an important though an accidental one. The Lombard chronicler tells us a romantic tale of the way in which Authari sought his bride from Garibald, duke of the Bavarians, how he went incognito in the embassy to judge of her attractions, and how she recognized her disguised suitor. The bride was the Christian Theodelinda, and she became to the Langobards what Bertha was to the Anglo-Saxons, and Clotilda to the Franks. She became the mediator between the Lombards and the Catholic Church. Authari, who had brought her to Italy, died shortly after his marriage. But Theodelinda had so won on the Lombard chiefs that they bid her as queen choose the one among them whom she would have for her husband and for king. She chose Agilulf, duke of Turin (592–615). He was not a true Langobard, but a Thuringian. It was the beginning of peace between the Lombards and the Catholic clergy. Agilulf could not abandon his traditional Arianism, and he was a very uneasy neighbor, not only to the Greek exarch, but to Rome itself. But he was favorably disposed both to peace and to the Catholic Church. Gregory interfered to prevent a national conspiracy against the Langobards, like that of St. Brice's day in England against the Danes, or that later uprising against the French, the Sicilian Vespers. He was right both in point of humanity and of policy. The Arian and Catholic bishops went on for a time side by side; but the Lombard kings and clergy rapidly yielded to the religious influences around them, even while the national antipathies continued unabated and vehement. Gregory, who despaired of any serious effort on the part of the Greek emperors to expel the Lombards, endeavored to promote peace between the Italians and Agilulf; and, in spite of the feeble hostility of the exarchs of Ravenna, the pope and the king of the Lombards became the two real powers in the north and centre of Italy. Agilulf was followed, after two unimportant reigns, by his son-in-law, the husband of Theodelinda's daughter, King Rothari (636–652), the Lombard legislator, still an Arian though he favored the Catholics. He was the first of their kings who did for the Lombards what was done by all the Teutonic conquerors as soon as they felt themselves a nation on Roman soil; he collected their customs under the name of laws,—and he did this, not in their own Teutonic dialect, but in Latin. The use of Latin implies the use of Latin scribes or notaries, and implies that the laws were a notice to the Italians of the usages and rules of their conquerors, which, so far as they applied, were to be not merely the personal law of the Lombards, but the law of the land, and binding on Lombards and Romans alike. But such rude legislation could not provide for all questions arising even in the shattered and decayed state of Roman civilization. It is probable that among themselves the Italians kept to their old usages and legal precedents where they were not overridden by the conquerors' law, and by degrees a good many of the Roman civil arrangements made their way into the Lombard code, while all ecclesiastical ones, and they were a large class, were untouched by it.

The precise nature of the relations, legal and political, of the Lombards, as a conquering race, or a military caste, to the Italians is still a subject of controversy, owing to the prevailing mixture of clearness and obscurity in the documents of the time. There must have been, of course, much change of property; but appearances are conflicting as to the terms on which land generally was held by the old possessors or the new comers, and as to the relative legal position of the two. Savigny held that, making allowance for the anomalies and usurpation of conquest, the Roman population held the bulk of the land as they had held it before, and were governed by an uninterrupted and acknowledged exercise of Roman law in their old municipal organization. Later inquirers, Leo, Troya, and more recently Hegel, have found that the supposition does not tally with a whole series of facts, which point to a Lombard territorial law ignoring completely any parallel Roman and personal law, to a great restriction of full civil rights among the Romans, analogous to the condition of the rayah under the Turks, and to a reduction of the Roman occupiers to a class of half-free "aldii," holding immovable tenancies under lords of superior race and privilege, and subject to the sacrifice either of the third part of their holdings or the third part of the produce. Probably something like this, with exceptions and anomalies, represents the state of things, at least at first; but it must be remembered that regular and consistent arrangements were very unlikely to have been thought of early in such a conquest as that of the Lombards, that the Romans suffered probably rather from the insolence of barbarians than from the rules of a constitutional settlement, and that a conquered race always and naturally exaggerates its own humiliations and grievances, and in this case has the chief telling of the story. It might also be expected that the tribal customs of Teutonic conquerors would be more modified in Italy than elsewhere, by the deeply-rooted traditions and customs of the old Roman rule. The Lombards were rough and harsh, and the Italians never ceased to hate them; but we know by experience how two portions of a population possessed of equal civil rights can hate one another, where they differ in blood and history. The Roman losses, both of property and rights, were likely to be great at first; how far they continued permanent during the two centuries of the Lombard kingdom, or how far the legal distinctions between Rome and Lombard gradually passed into desuetude, is a further question. The legislation of the Lombard kings, in form a territorial and not a personal law, shows no signs of a disposition either to depress or to favor the Romans, but only the purpose to maintain, in a rough fashion, strict order and discipline impartially among all their subjects.

From Rothari (*ob.* 652) to Liutprand (712–744) the Lombard kings, succeeding one another in the irregular fashion of the time, sometimes by descent, sometimes by election, sometimes by conspiracy and violence, strove fitfully to enlarge their boundaries, and contended with the aristocracy of dukes inherent in the original organization of the nation, an element which, though much weakened, always embarrassed the power of the crown, and checked the unity of the nation. Their old enemies the Franks on the west, and the Slavs or Huns, ever ready to break in on the northeast, and sometimes called in by mutinous and traitorous dukes of Friuli and Trent, were constant and serious dangers. By the popes, who represented Italian interests, they were always looked upon with dislike and jealousy, even when they had become zealous Catholics, the founders of churches and monasteries; with the Greek empire there was chronic war. From time to time they made raids into the unsubdued parts of Italy, and added a city or two to their dominions. But there was no sustained effort for the complete subjugation of Italy till Liutprand, the most powerful of the line. He tried it, and failed. He broke up the independence of the great southern duchies, Benevento and Spoleto. For a time, in the heat of the dispute about images, he won the pope to his side against the Greeks. For a time, but only for a time, he deprived the Greeks of Ravenna. Aistulf, his successor, carried on the same policy. He even threatened Rome itself, and claimed a capitation tax. But the popes, thoroughly irritated and alarmed, and hopeless of aid from the east, turned to the family which was rising into power among the Franks of the West, the mayors of the palace of Austrasia. Pope Gregory III. applied in vain to Charles Martel. But with his successors Pippin and Charles the popes were more successful. In return for the transfer by the

pope of the Frank crown from the decayed line of Clovis to his own, Pippin crossed the Alps, defeated Aistulf, and gave to the pope the lands which Aistulf had torn from the empire, Ravenna and the Pentapolis (754–756). But the angry quarrels still went on between the popes and the Lombards. The Lombards were still to the Italians a "foul and horrid" race. At length, invited by Pope Adrian I., Pippin's son Charles once more descended into Italy. As the Lombard kingdom began, so it ended, with a siege of Pavia. Desiderius, the last king, became Charles's prisoner (774), and the Lombard power perished. Charles, with the title of king of the Franks and Lombards, became master of Italy, and in 800 the pope, who had crowned Pippin king of the Franks, claimed to bestow the Roman empire, and crowned his greater son emperor of the Romans (800).

3. To Italy the overthrow of the Lombard kings was the loss of its last chance of independence and unity. To the Lombards the conquest was the destruction of their legal and social supremacy. Henceforth they were equally with the Italians the subjects of the French king. Charles, the Carolingian king, expressly recognized the Roman law, and allowed all who would be counted Romans to "profess" it. Latin influences were not strong enough to extinguish the Lombard name and destroy altogether the recollections and habits of the Lombard rule; Lombard law was still recognized, and survived in the schools of Pavia. Lombardy remained the name of the finest province of Italy, and indeed for a time was the name for Italy itself. But what was specially Lombard could not stand in the long run against the Italian atmosphere which surrounded it, with its countless and subtle forces, social, political, and religious. Generation after generation passed more and more into real Italians. Antipathies, indeed, survived, and men even in the 10th century called each other Roman or Langobard as terms of reproach. But the altered name of Lombard also denoted henceforth some of the proudest of Italians; and, though the Lombard speech had utterly perished, their most common names still kept up the remembrance that their fathers had come from beyond the Alps.

But the establishment of the Frank kingdom, and still more the re-establishment of the Christian empire as the source of law and jurisdiction in Christendom, had momentous influence on the history of the Italianized Lombards. The empire was the counterweight to the local tyrannies into which the local authorities established by the empire itself, the feudal powers, judicial and military, necessary for the purposes of government, invariably tended to degenerate. When they became intolerable, from the empire were sought the exemptions, privileges, immunities from that local authority, which, anomalous and anarchical as they were in theory, yet in fact were the foundations of all the liberties of the Middle Ages in the Swiss cantons, in the free towns of Germany and the Low Countries, in the Lombard cities of Italy. Italy was and ever has been a land of cities; and, ever since the downfall of Rome and the decay of the municipal system, the bishops of the cities had really been at the head of the peaceful and industrial part of their population, and were a natural refuge for the oppressed, and sometimes for the mutinous and the evil doers, from the military and civil power of the duke or count or judge, too often a rule of cruelty or fraud. Under the Carolingian empire, a vast system grew up in the North Italian cities of episcopal "immunities," by which a city with its surrounding district was removed, more or less completely, from the jurisdiction of the ordinary authority, military or civil, and placed under that of the bishop. These "immunities" led to the temporary sovereignty of the bishops; under it the spirit of liberty grew more readily than under the military chief. Municipal organization, never quite forgotten, naturally revived under new forms, and with its "consuls" at the head of the citizens, with its "arts" and "crafts" and "guilds," grew up secure under the shadow of the church. In due time the city populations, free from the feudal yoke, and safe within the walls which in many instances the bishops had built for them, became impatient also of the bishop's government. The cities which the bishops had made thus independent of the dukes and counts next sought to be free from the bishops; in due time they too gained their charters of privilege and liberty. Left to take care of themselves, islands in a sea of turbulence, they grew in the sense of self-reliance and independence; they grew also to be aggressive, quarrelsome, and ambitious. Thus, by the 11th century, the Lombard cities had become "communes," commonalties, republics, managing their own affairs, and ready for attack or defence. Milan had recovered its greatness, ecclesiastically as well as politically; it scarcely bowed to Rome, and it aspired to the position of a sovereign city, mistress over its neighbors. At length, in the 12th century, the inevitable conflict came between the republicanism of the Lombard cities and the German feudalism which still claimed their allegiance in the name of the empire. Leagues and counter-leagues were formed; and a confederacy of cities, with Milan at its head, challenged the strength of Germany under one of its sternest emperors, Frederick Barbarossa. The struggle was terrible. At first Frederick was victorious; Milan, except its churches, was utterly destroyed; everything that marked municipal independence was abolished in the "rebel" cities; and they had to receive an imperial magistrate instead of their own (1158–62). But the Lombard league was again formed. Milan was rebuilt, with the help even of its jealous rivals, and at Legnano (1176) Frederick was utterly defeated. The Lombard cities had regained their independence; and at the peace of Constance (1183) Frederick found himself compelled to confirm it.

From the peace of Constance the history of the Lombards is merely part of the history of Italy. Their cities went through the ordinary fortunes of most Italian cities. They quarrelled and fought with one another. They took opposite sides in the great strife of the time between pope and emperor, and were Guelf and Ghibelline by old tradition, or as one or other faction prevailed in them. They swayed backwards and forwards between the power of the people and the power of the few; but democracy and oligarchy passed sooner or later into the hands of a master who veiled his lordship under various titles, and generally at last into the hands of a family. Then, in the larger political struggles and changes of Europe, they were incorporated into a kingdom, or principality, or duchy, carved out to suit the interest of a foreigner, or to make a heritage for the nephew of a pope. But in two ways especially the energetic race which grew out of the fusion of Langobards and Italians between the 9th and the 12th centuries has left the memory of itself. In England, at least, the enterprising traders and bankers who found their way to the West, from the 13th to the 16th centuries, though they certainly did not all come from Lombardy, bore the name of Lombards. In the next place, the Lombards, or the Italian builders whom they employed or followed, the "masters of Como," of whom so much is said in the early Lombard laws, introduced a manner of building, stately, solemn, and elastic, to which their name has been attached, and which gives a character of its own to some of the most interesting churches in Italy. (R. W. C.)

LOMBOK (called Tanah Sasak by the natives, and Saliparan or Selaparang by the Balinese, Lombok being properly the name only of a village on the north-east side), an island of the East Indian Archipelago, belonging to the lesser Sunda group, and separated from Bali by the Strait of Lombok, from Sumbawa by the Strait of Alas. It stretches from about 115° 44′ to 116° 40′ E. long. and from 8° 12′ to 9° 1′ S. lat., and its area is estimated at 2080 square miles. Rising out of the sea with bold and often precipitous coasts, Lombok is mountainous towards the south, and in the north-east contains one of the principal volcanic summits of the whole archipelago—Rindjani or peak of Lombok, 8688 feet according to Horsburgh's measurement, 12,379 according to Melvill de Carnbée, and 11,834 according to Smits. There is no active crater in the

island, but in 1815 it suffered severely from the eruption of Tombora on the neighboring island of Sumbawa. Of the numerous streams by which it is watered none are navigable except by small boats; among the mountain lakes Segara Anak, lying some 9000 feet above the sea, is noteworthy in point of size. The best harbor is Ampanan (8° 34′ 15″ S. lat., 116° 3′ 40″ E. long.) on the west coast, often visited by European and American vessels; that of Labuhan Tring farther south is also good, but less frequented. Forest-clad mountains and stretches of thorny jungle alternating with rich alluvial plains, cultivated like gardens under an ancient and elaborate system of irrigation, make the scenery of Lombok exceedingly attractive; and to the naturalist it is of particular interest as the frontier island of the Australian region, with its cockatoos and megapods or mound builders, its peculiar bee-eaters and ground thrushes. Rice is the principal export; ponies, skins, ducks' eggs and other eggs, and edible nests, are also sent from the island. The rajah of Lombok (who has his capital at Mataram, a large village on the west coast, and his country seat at Gunong Sari) is tributary to the susuhunan of Bali and Lombok; he has possession of the whole island, which was formerly divided into the four states of Karang-Asam Lombok on the west side, Mataram in the north-west, Pagarawan in the south-west, and Pagutan in the east. Balinese supremacy dates from the conquest by Agong Dahuran in the beginning of the present century; the union under a single rajah dates from 1839. The population is variously estimated. The *Woordenboek van Ned. Ind.* (1869) gives about 405,000 souls; Behm and Wagner conjecture 100,000 in 1880. The greater portion are Sassaks, as the Mohammedanized native stock are called; but the dominant Balinese, who still retain their Buddhist creed, may amount to about a twentieth of the whole.

LOMONÓSOFF, Mikhail Vasilievich (1711–1765), was born in the year 1711, in the village of Denisovka (which in later times has had its name changed in honor of the poet), situated on an island not far from Kholmogorî, in the government of Archangel. His father, a fisherman, took the boy as soon as he was ten years of age to assist him in the labors of his calling; but his eagerness for knowledge was unbounded. The few books accessible to him he almost learned by heart; and, seeing that there was no chance of his stock of knowledge being enlarged under the arctic skies of his native place, he resolved to betake himself to Moscow in the best way he could. An opportunity occurred when he was seventeen years of age, and by the intervention of friends he obtained admission into the Zaikonospasski school. There his progress was very rapid, especially in Latin, and in 1734 he was sent from Moscow together with other promising students to St. Petersburg. There again his proficiency, especially in physical science, was remarked by all, and he was one of the young Russians chosen to complete their education in foreign countries. He accordingly commenced the study of metallurgy at Marburg; but, not content with his work under the professors, he now began to write poetry, imitating German authors, among whom he has said to have especially admired Günther. His *Ode on the Taking of Khotin from the Turks* was composed in 1739, and attracted a great deal of attention at St. Petersburg. During his residence in Germany Lomonósoff married a native of the country, and found it difficult to maintain his increasing family on the scanty allowance granted to him by the St. Petersburg Academy, which, moreover, was irregularly sent. His circumstances became embarrassed, and he resolved to leave the country secretly, and to return home. On his arrival in Russia, after an adventure with a Prussian recruiting officer which at one time threatened serious consequences, he rapidly rose to distinction, and was made professor of chemistry in the university of St. Petersburg; he ultimately became rector, and in 1764 secretary of state. He died in 1765.

The most valuable of the works of Lomonósoff are those relating to physical science, and he wrote upon many branches of it. He everywhere shows himself a man of the most varied learning. He compiled a Russian grammar, which long enjoyed popularity, and did much to improve the rhythm of Russian verse. Many of his poems are good, but they do not constitute his chief claim to be remembered. The school upon which he formed himself as a poet was a bad one. We must remember that these were the days of falsely-conceived classicism, and the French taste upon which all the literature of Europe was moulded. His great merit is that he belongs to the glorious band of patriots, which includes such men among Slavs as Dositei Obravodich, Raich, and Primus Truber,—men whose object was to elevate and give dignity to their country,—earnest toilers in the field of national education.

LOMZA, or Lomzha, a government of Russian Poland, is bounded on the N. by Prussia and the Polish government of Suwalki, on the E. by the Russian government of Grodno, on the S. by the Polish governments of Siedlce and Warsaw, and on the W. by that of Plock. It covers an area of 4072 square miles, or 9½ per cent. of all Poland. It is mostly flat or undulating, with a few tracts in the north and south-west, where the deeply-cut valleys give a hilly aspect to the country. Extensive marshes overspread it, especially on the banks of the Nareff, and in the east there are also good forests. Lomza is traversed by the Nareff, which flows from east to south-west, joining the Bóg in the south-western corner of the government. The Bóg flows along the southern border, joining the Vistula 20 miles below its junction with the Nareff. The inhabitants numbered 501,385 in 1872, the Poles constituting 76 per cent. of the population (or 83 per cent. when the Poles who are mixed with Lithuanians are included), the Jews 14½ per cent., and the Germans 2 per cent. Of this population 402,146 belonged in 1870 to the Catholic Church, 10,354 to the Protestant, and 1817 to the Greek and United Churches. In 1878 394,570 were peasants, while only 76,950 belonged to the citizen class, and 11,470 to the nobility (*szlachta*). In 1877 45 per cent. of the total area, or 1,366,000 acres, were under crops. Stock raising is carried on to some extent (197,900 cattle, 263,700 sheep, and 68,705 horses). The wood trade is an important branch of industry, but manufactures are very imperfectly developed, the total production in 1873 having been only some £110,000, or 1·3 per cent. of the total for Poland. Lomza produces some wooden wares, spirits, tobacco, and sugar. There is only one railway (between Grodno and Warsaw); the Bóg is navigable, but only wood is floated down the Nareff. The province is divided into eight districts, of which the chief towns are Lomza (26,077), Pultusk (7950), and Ostrolenka (6900) on the Nareff; Mazowiec (2750), Ostrów (6300), Maków (6600), Kolno (4800), and Szczuczyn (4750). Tykocin (5400) and Nasielsk (6250), although not district towns, have lately acquired some importance. Pop. in 1906, 653,100.

Lomza, capital of the above province, on the Nareff, 80 miles north-east from Warsaw, and 30 miles north from the Chizheff station of the railway between Warsaw and Grodno, had a population in 1897 of 26,075.

Lomza is an old town, one of its churches having been erected before the year 1000. In the 16th century it carried on a brisk trade with Lithuania and Prussia. It was well fortified and had two citadels, but nevertheless had often to suffer from the invasions of Germans and Tartars, and in the 17th century it was twice plundered by the Cossacks of the Ukraine. In 1795 it fell under the dominion of Prussia, and after the peace of Tilsit it came under Russian rule.

LONDON.

LONDON, the metropolis of England, and the chief town of the British empire, is situated on both banks of the river Thames, about 50 miles from its mouth, St. Paul's Cathedral being in 51° 30′ 48″ N. lat. and 0° 5′ 48″ W. long. The old City of London is wholly included in the county of Middlesex, but the town beyond the City limits extends into portions of three other counties,—namely, Surrey and Kent on the south, and Essex on the east. The area and population of the various governmental divisions of London are given below (pp. 830, 831).

Plates IX., X.

Geology.

SITE.—A great part of London is built on sands and gravels belonging to the Drift period, marking the ancient bed of a much larger river than the present Thames. This formation, resting immediately on the London Clay, extends along both banks of the present river, with an average breadth of about 2 miles; but in some parts there is immediately adjoining the banks a considerable breadth of alluvial deposits, or occasionally of artificially constructed embankments. On the north bank the alluvial soil comprehends the greater part of Westminster; on the south bank it stretches east from Lambeth Bridge, gradually widening to a breadth of about half a mile, and from Southwark to Deptford occupying a still wider area. The sands and gravels again occur at Greenwich Hospital, but are succeeded by the Greenwich and Woolwich marshes. The Isle of Dogs opposite Greenwich is constructed wholly of artificial embankments, and at one time the area it now occupies formed part of the mouth of the Lea, along whose banks the alluvial formation runs northwards between Bow and Stratford to Stoke Newington, widening to a considerable area at the marshes of West Ham and Plaistow. At Fareham, Battersea Park, Cheapside, Victoria Park, and to the south of Stoke Newington, there are considerable areas occupied by brick earth. The London Clay crops to the surface throughout the whole of north-west London, with the exception of a small portion to the south of Regent's Park, which is encroached upon by the sands and gravels, and the summits of Hampstead and Highgate, which are occupied by the silicious sands of the Bagshot series. In west London the Clay extends south to Kensington Gardens, and in north London it occupies part of Islington and the district north of Highbury and Stoke Newington. South of the Thames it encroaches irregularly on Wandsworth, Clapham, Camberwell, and Deptford, and comprehends nearly all the district round Sydenham. The Lower Tertiaries are represented by the Thanet sands at Greenwich and in the neighborhood of Deptford, by the Woolwich and Reading beds, which occur at Camberwell, Dulwich, and Lewisham, and by the Blackheath beds, which are best seen at Blackheath. Chalk, the basement rock of the London basin, and the source of the water supply for the deep wells, only crops to the surface in the neighborhood of Greenwich.

Surface.

The original surface of the soil of London has been much altered in the course of generations, the depth of made earth being often very great. At one period the Thames flowed straight from Lambeth to Limehouse, and the greater part of the district now stretching south and east of the river to the range of heights in the neighborhood of Sydenham and Greenwich was occupied by marshes or shallow lagoons. North of the Thames the greater part of London is built on several ranges of small eminences lying between the river and the northern heights of Hampstead (430 feet), Highgate, and Hornsey. The original city clustered round the eminence now crowned by St. Paul's, and formerly intersected by the ravine of the Walbrook. To the north and east it was bounded by an extensive fen, from which Finsbury takes its name. To the west was the Fleet river, which flowed from Hampstead in a south-easterly direction to King's Cross, and then more southerly to Clerkenwell, where on account of the steepness of its banks it received the name of Holebourne or Hollowburn. It was navigable to King's Cross, and for a long period formed a convenient and well-protected harbor for the city. A more extended elevation, included in the district now occupied by the Inns of Court, Bloomsbury, and Soho, was bounded on the west by the Tyburn, which rose near the Swiss Cottage, and, after an easterly course till reaching the present Regent's Park, flowed southwards nearly in the line of Marylebone Lane and Bond Street. Tyburn Hill was bounded on the west by the Westbourne; and to the south and west an extensive range of low ground, now included in Westminster, Pimlico, Chelsea, and Kensington, was in early times for the most part covered by water. Westwards the low ground is bounded by Notting Hill, whence an elevated region lying between the smaller eminences and the "northern heights," and including Primrose Hill, runs in a north-westerly direction to Camden Town, Islington, and Highbury. The hilly regions in the neighborhood of Kensington and Notting Hill formed part of an extensive forest, and St. John's Wood was originally a dense thicket.

Administrative history.

GOVERNMENT AND ADMINISTRATION.—At first the municipal constitution of London was loose and disjointed in its form, resembling that of the shire rather than the town, but even from the time of Henry I. the independence of its jurisdiction was complete, and the citizens, besides the right of inheritance and tenure not then possessed by the rest of England, enjoyed exemption from the Danegeld and from similar obligations. By the 13th century the later form of the municipality was already shaped in its main features, although at this stage residence in the borough and not membership in a trade guild was the basis of citizenship. This in some respects premature development of municipal functions has always given to London a peculiar and unique position in respect of municipal government. Its charters, which in early times served as the model for charters to new incorporations, have defied the attacks of reform. The system of government was more heterogeneous and complicated than that of other English towns. London is practically a borough by prescription, and its special rights and privileges have made those who possess them distrustful of change. The mere extent of the new city surrounding the old, and the rapidity of its growth, have also tended to postpone the attempt to grapple with the problem of its government. Until 1855, when the Metropolitan Board of Works was formed, the whole administration of the metropolis was of a mediæval character. The City was governed by old charters, confirmed but not interpreted by a special Act of William and Mary, and the various parishes of the rest of the metropolis had each its own peculiar system of administration, regulated by local Acts which differed widely in different localities. No direct change of vital importance was made in the constitution and functions of the City corporation by the Metropolis Local Management Act of 1855, but the very existence of the Metropolitan Board implied a certain limitation of its authority, and the additional functions conferred by successive Acts on the Metropolitan Board have in some degree circumscribed its influence. As modified by the Act of 1855,[1] the government of London within what is known as the metropolitan area consists of the City Corporation, the Metropolitan Board of Works, and thirty-eight vestries and district boards; while various authorities, to be afterwards mentioned, exercise jurisdiction in special matters over the whole area of the metropolis or in separate localities

[1] [By Act of 1888, about 118 square miles were erected into the county of London, containing fifty-seven districts, each of which elects two councillors, the City adding four. The County Council superseded the Metropolitan Board of Works, and it elects nineteen alderman associates for six years each; councillor's term is three years.—AM. ED.]

Government of the City.

The City of London, which is a county in itself, and with which the borough of Southwark is assimilated, is governed by a lord mayor, twenty-six aldermen, and two hundred and six common councilmen, forming a Court of Common Council. This court has a certain independent power to enact regulations for the government of the City, is entrusted with the management of the finances and the estates of the corporation, elects most of the officials, and controls the police. The City elects a sheriff of Middlesex as well as a sheriff of London; and the lord mayor is elected by the trade guilds in common hall from among the aldermen who have served as sheriffs. He is lord lieutenant within the City, the dispenser of its hospitality, the chairman of the courts of the corporation, and holds certain other offices, the dignity of which is now almost entirely nominal. The aldermen, who hold office for life, are chosen by the several wards, each ward electing one. Since 1867 the power of election has been enjoyed by all possessing the household and lodger franchise. The Court of Aldermen has the power of appointment to certain offices, exercises judicial functions in regard to licensing and in disputes connected with the ward elections, has some power of disposal over the City cash, and possesses magisterial control over the City, each alderman being a judge and magistrate for the whole City, and by virtue of his office exercising the functions of a justice of the peace. The common councillors were chosen originally in the reign of Edward I. as assistants to the aldermen, and in 1384 were constituted a standing committee to regulate the affairs of the City, each ward choosing four, six, or eight, according to its size. A gradual increase in their number took place until 1840, when it was fixed at two hundred and six. From the time of Richard II. the election was vested in freemen householders, but it is now regulated by the Act of 1867. The Court of Common Hall, formerly the popular assembly or ancient *folkmote*, is now composed of the lord mayor, four aldermen, and the liverymen of the city guilds, and nominates yearly two aldermen, who must previously have been sheriffs, for the Court of Aldermen to select one for the office of lord mayor. The sheriffs are themselves chosen by the Court of Common Hall, which also appoints the chamberlain, the bridge masters, and the city auditors.

City guilds.

The fragmentary and indirect participation in the government of London at present exercised by the livery companies represents the remnants of an influence which was paramount from the time of Edward III., when enactments were passed which made admission to the freedom of the city dependent on membership in a trade or mystery. Originally established to afford mutual aid to members of their "craft," the guilds of London gradually assumed a certain control over their trade or manufacture, and by the payment of large sums of money obtained various monopolies, with the power to make by-laws for the regulation of their craft. From gifts for charitable purposes, and from entrance money and fines, many of the guilds, on account of the rise in the value of property, have amassed enormous wealth. Within the limits of the City alone the gross annual rental of the land possessed by them is over £500,000, and it is believed that the land they possess outside its limits is of equal value. At one time their number was over one hundred, but they now number seventy-six, and some represent trades which are extinct. Twelve so-called "great companies" claim precedence over the others, but of these some are not so wealthy as a few of the less highly privileged. The "livery" or dress of the companies, first formally adopted in the reign of Edward III., was ultimately worn only by a higher grade of the members called liverymen. The extension of London beyond the City limits and changes in trade maxims and in social life have now left them little more than the shadow of their former authority over trade and manufacture, but a few, such as the fishmongers, the stationers, the goldsmiths, and the apothecaries, still discharge certain functions in the regulation of their several crafts. Besides administering their charities, many of the companies contribute largely to benevolent objects of pressing need, and some take an interest in promoting technical instruction, and in various matters relating to their special trade or manufacture; but the business of most of them is now chiefly of a ceremonial kind. The halls of the companies number thirty-five, and many of them are of interest either from their architectural merits, their antiquarian associations, or the portraits or other objects they contain. Their annual assessed value is over £60,000. The hereditary connection of the companies with the corporation, their large ownership of property in the City, and their control over so many charities still enable them to exercise a very great influence in municipal affairs.

The following list (Table I.) gives details regarding the twelve great companies, and six other companies which may be ranked next to them in importance:—

Name.	Date.	Situation of Hall.	Purchase of Freedom.	Livery Admission.
			£ s. d.	£ s. d.
Great Companies.				
Mercers	1393	Cheapside	...	...
Grocers	1345	Poultry	4 11 0	23 10 0
Drapers	1364	Throgmorton Street	108 0 0	26 5 0
Fishmongers	1363	Upper Thames Street	113 10 6	31 15 0
Goldsmiths	1327	Foster Lane	1 19 0	63 7 0
Skinners	1327	Dowgate Hill	...	...
Merchant Taylors	1466	Threadneedle Street	84 0 0	80 8 0
Haberdashers	1448	Gresham Street	84 0 0	...
Salters	1530	St. Swithin's Lane	...	20 0 0
Ironmongers	1464	Fenchurch Street	110 1 6	45 5 0
Vintners	1363	Upper Thames Street	126 0 0	...
Clothworkers	1480	Mincing Lane	110 11 6	108 17 0
Other Companies.				
Apothecaries	1615	Water Lane	105 0 0	22 0 0

Cordwainers	1410	Cannon Street	60 0 0	40 0 0
Saddlers	1364	Cheapside	63 0 0	20 5 0
Stationers	1556	Ludgate Hill	33 0 0	70 0 0

Special prerogatives of the City corporation.

The corporation of the City of London still retains certain exceptional prerogatives. The lord mayor's court still exercises civil jurisdiction, the two courts of the sheriffs' compter survive in the City of London court, and the lord mayor exercises the functions of judge in the central criminal court, which superseded the court of oyer and terminer in 1834, and extends beyond the radius of the Metropolitan area. The corporation possesses the sole right to establish markets within 7 miles of the City; it enjoys a metage of grain, partially commuted in 1872 to a fixed duty chargeable by weight, and applied to the preservation of Epping Forest and other open spaces; and it levies coal and wine duties, continued by various Acts, for defrayment of the cost of public improvements. Most of the work of the corporation is performed by committees; and "commissioners of sewers," under act of Parliament, have charge of the cleaning, lighting, and paving of the streets.

City accounts.

A large portion of the City income is derived from rents, which have increased from £3488 in 1692 to £19,199 in 1785, £45,269 in 1825, and £117,781 in 1881. In 1692 the City markets were farmed for £3100, the profit being about £2500; in 1785 their revenue was £15,631, and the profit £2621; in 1825 these were respectively £58,958 and £52,271; and in 1881 they were £152,816 and £20,911. The total revenue of the City in 1692 was £11,658, in 1785 £59,356, and in 1881 £896,688, not including the public and trust accounts, which are regulated by various Acts of Parliament. They include the Bridge-House estate account, the sewers rate, the Metropolitan Board of Works sewers rate, the police rate, the ward rate, and the duties on coal, wine, and grain. The total charge of the government establishment in 1692 was £3947, and in 1881 it was £51,855, not including £7856 spent in pensions of officials. In 1692 the lord mayor received an annual sum of £100 for his care of the market, and an ancient fee of £80 out of the chamber. He has now an annual salary of £10,000, and in addition to this his

personal expenses in 1881 amounted to £4433. The salaries of the recorder, the chamberlain, the common sergeant, the town-clerk, and some other officers have risen in a somewhat similar proportion. The City in 1692 spent nothing on special acts of hospitality or on the promotion of literature, science, or art, while its contribution to the poor rates was only £66. It now spends several thousands annually on the reception of eminent persons, while to the London almshouses it in 1881 contributed £1884, to general charitable purposes £5179, for education £5394, for technical instruction £2000, for the Guildhall library and museum £5398, and for music £3027. The debt of the corporation, which is solely connected with the construction of improvements and public markets, was on December 31, 1881, £5,496,150, the money spent for these purposes since 1759 being nearly £10,000,000. The ratable value of the City and liberties has since 1801 increased sevenfold, having risen from £507,372 to £3,535,494.

Corporation buildings.

The Guildhall, rebuilt by Dance in 1789, contains the greater part of the walls of the old building of 1411, which was damaged by the fire of 1666, and also the crypt divided into three aisles by clustered columns of marble supporting a groined roof richly adorned with carvings. The principal front was restored in 1867 in the Gothic style. In addition to the great hall used for state banquets and receptions, the building contains the common council chamber, the aldermen's room, and several courts of justice. Adjoining the Guildhall is the free library of the corporation, and a museum of antiquities relating to the City. The Mansion House at the east end of the Poultry, erected in 1740 from the designs of Dance, is the official residence of the lord mayor. In addition to the justice room and various reception rooms, it contains the Egyptian hall, in which certain special banquets of the lord mayor are held.

Metropolitan Board.

By the Metropolis Local Management Act of 1855, the metropolis was divided into thirty-nine vestries or district boards,[1] which elect the forty-five members who form the Metropolitan Board of Works, the city of London electing three members, each of the six great parishes of Islington, Marylebone, St. Pancras, Lambeth, St. George's (Hanover Square), and Shoreditch two members, and the other districts one each or one in combination. The board was originally established for the formation and maintenance of main sewers, but later Acts have made it the administrative authority of the metropolis in a great variety of other matters, including the construction of main thoroughfares, the carrying out of great metropolitan improvements, the formation of new streets, the construction and maintenance of parks, the preservation of commons and open spaces, the maintenance of the fire brigade, and the administration of certain enactments specially applicable to the metropolitan area. The total sum raised by the board for application to its various purposes since 1856 to 31st December, 1881, was £28,689,749, and its net liability on the 31st December, 1881, was £13,437,940. The capital required for the execution of great works is raised by the issue of stock bearing interest at the rate of 3½ and 3 per cent., which has the same facilities of transfer as the Government stocks, and is redeemable in sixty years from creation. The rate per pound levied by the board has varied very greatly, being 2·09d. in 1856, and as high as 6·99d. in 1867, while for 1883 it is estimated at 6·2d. The total net charge in 1880 was £652,213, and for 1882 it is estimated at £715,822. The ratable annual value of property in the metropolis has risen from £11,283,663 in 1856 to £27,386,086 in 1882.

Vestries.

The vestries and district boards are entrusted with the management of local sewers, the lighting, paving, and cleaning of their own thoroughfares, and the removal of nuisances. For paving, except in the old main thoroughfares, they have power to charge adjoining properties, and in several districts a small income is obtained from realized property. The total amount of money advanced to them on loan by the Board of Works up to 31st November, 1881, was £3,631,769, of which £3,297,430 was redeemable by 1929 and £334,338 by 1941.

Other administrative authorities.

The School Board of London has in regard to education a rating and legislative authority over a district corresponding with that of the Metropolitan Board of Works. The metropolitan police force outside the City limits and within a radius of 12 miles of Charing Cross is under the control of the Home Secretary. The Tower of London is governed by the constable of the Tower, assisted by fifty magistrates, and the borough of Westminster is still under the nominal care of the dean and burgesses. The Metropolitan Asylums Board, the Burial Board, the Thames Conservancy Board, and the Lea Conservancy Board constitute the principal other direct governing authorities having relation to London, but the water and gas companies enjoy monopolies which imply a certain degree of irresponsible authority, and a right of taxation not sufficiently defined and limited. Within an area less than the district of the Board of Works there are ten parliamentary boroughs, which return in all twenty-two members, the City returning four members, and Southwark (from 1295), Westminster (1547), Marylebone (1832), Finsbury (1832), Tower Hamlets (1832), Greenwich (1832, extended in 1868), Lambeth (1832), Hackney (1868), and Chelsea (1868), two each. London University (1868) returns one member.

Growth.

Growth and Population.—For some centuries after the Conquest there are almost no data for an estimate of the extent and population of London, but a great impulse was given to its increase by the settlement of Normans and the opening up of intercourse with the Continent. The statement of Fitzstephen that it furnished, in the reign of Stephen, 60,000 men-at-arms and 20,000 knights, cannot be accepted as applying only to the City. Peter of Blois, under Henry II., only estimated its numbers at 40,000, although he may possibly have referred only to adults (*Opera*, ed. Giles, vol. ii. p. 85). In any case, previous to the great plague of 1349 it must have numbered at least 90,000, for in that year, according to Stow, as many as 50,000 persons were buried in the cemetery of Spitalcroft, specially consecrated for the purpose. There were severe ravages from the same cause in 1361 and 1369; and the calculation of Chalmers (*Comparative Estimate of Great Britain*, 1802), founded on the Subsidy Rolls of 1377, shows a population of only 34,971; but the emperor Manuel II., who visited it in 1400, states that it was to be preferred to every city of the West for population, opulence, and luxury (Macpherson, *Annals of Commerce*, vol. i. p. 611). Notwithstanding the regulations of Elizabeth for checking its growth, London had by the end of the century advanced considerably beyond its old boundaries. Giovanni Botero, writing about 1590, classes it with Naples, Lisbon, Prague, and Ghent, as possessing about 160,000 inhabitants more or less, while Paris was said to possess over 400,000 inhabitants. The "Bills of Mortality," which were begun in 1592, were in 1604 extended to St. Bartholomew the Great, Bridewell Precinct, and Trinity in the Minories, which were partly within the City liberties, and to St. Clements Danes, St. Giles-in-the-Fields, St. James (Clerkenwell), St. Catherine (Tower), St. Leonard (Shoreditch), St. Mary in Whitechapel, St. Martin-in-the-Fields, and St. Mary Magdalen (Bermondsey). St. Mary at the Savoy was added in 1606, and Westminster in 1626. The parishes of Hackney, Islington, Lambeth, Newington, Rotherhithe, and Stepney, which were included in 1636, were, according to Graunt (*Observations on the Bills of Mortality*, 1676), still country villages in 1672, and indeed occupied an isolated position up to the middle of the 18th century. The result of the census of the city taken in 1631 is given by Graunt as 130,178, but the sum of his details is 130,268. By 1661 he reckoned it to have increased to 179,000. He also concluded that the population within the limits of the "Bills of Mor-

[1] [By Act of 1885 there were fifty-seven districts formed, but the functions of the Metropolitan Board have been given to the new County Council.—Am. Ed.]

tality was 460,000, and that from the beginning of the century it had increased from 2 to 5. The population of London and its suburbs, excluding Westminster and the distant parishes, he placed at 384,000, or about a fourth less than Paris. Notwithstanding the plague of 1665 and the fire of 1666, London towards the close of the 17th century increased with great rapidity. Evelyn, writing in 1684, states that it had nearly doubled within his own recollection. Sir William Petty, in his *Essay on Political Arithmetic*, estimated the population in 1683, including that of Westminster and Southwark, at 696,000, but Gregory King, in his *Observations on the State of England*, first published by Chalmers, allowing 5½ persons to every house, makes it in 1694, within the limits of the "Bills of Mortality," only 530,000. From about this period London superseded Paris as the largest city in Europe. During the first half of the 18th century its progress was fluctuating, but on the peace of 1763 a great impulse was given to its prosperity, and after 1780 a rapid rate of progress commenced, which still shows no signs of diminution. Until 1756 there was sufficient space for the Mayfair east of Hyde Park, but by the end of the century the aristocracy had nearly all migrated west from Covent Garden and Soho. Islington was still almost disjoined from the metropolis, but the great eastern suburbs had become so consolidated as almost to absorb even Hoxton, Bethnal Green, and Stepney. The first census of 1801 included St. Pancras, Marylebone, Paddington, Kensington, and Chelsea, but Chelsea was still a solitary suburban retreat, Kensington was little more than "the old court suburb," Paddington and Westbourne were rural hamlets, and Marylebone and St. Pancras had less than one-fourth of their present population. The populous city surrounding Regent's Park had scarcely any existence before 1820, but by 1830 it as well as Somers Town had become absorbed in the metropolis, especially by additions in the neighborhood of St. Pancras church and London university. Eastwards the most rapid extension had been in the direction of Greenwich, which was now united with Lambeth by a continuous line of houses. Belgravia in the south-west, and Tyburnia to the north of Hyde Park are chiefly the product of the next twenty years. Since that period the suburban districts have in all directions become almost consolidated, and beyond the present limits of the registrar-general fringes of houses, extending in some instances outside even the 12 miles circuit from Charing Cross, connect the metropolis with populous towns which a few years ago were solitary hamlets. Within the last twenty years the rate of increase of the outer ring of this greater London has been 126·8 per cent., while that of London proper has been only 36·0, its outer ring showing an increase of 63·8 per cent., but its central area a decrease of 13·2,—the decrease in the City being 54·8, in the Strand 30·5, St Giles 16·3, Holborn 9·5, Westminster 11·9, St. George's (Hanover Square) and Marylebone 4·1, and in the eastern central districts of Whitechapel, St. George-in-the-East, and Shoreditch 9·6, 3·8, and 2·2 respectively. In these latter districts the decrease has been occasioned chiefly by improvements, but in the central business districts it is almost entirely the result of the substitution of business premises for dwelling-houses. The day census of the City taken in 1866 shows that the number of persons employed daily within its limits was 170,133, and that of 1881 gives a day population of 261,061, while the night population in 1871 was 74,897 and in 1881 only 50,526. The rapidity of the growth of London is largely due to the peculiar development of its trade and commerce, and is also closely connected with the interest excited by politics and the meetings of parliament. The bonds of connection between London and England thus pulsate daily with a manifold vitality. London is the emporium of England, the centre of its great monetary transactions, the home of its science, literature, and art, and the yearly resort of its aristocratic and landed proprietor classes. Since the beginning of the century its rate of increase has exceeded that of England generally.

Nationalities.

The proportion of inhabitants born outside its limits amounts to one-third of its entire population. The number of the natives of European states is in excess of those born in Scotland, and that of the natives of Ireland is about double, while the natives of the counties of England and Wales amount to more than a million. Irishmen by descent may be estimated at about 250,000 persons, Scots 120,000, foreigners 200,000, viz., Asiatics, Africans, and Americans together 45,000, Europeans 155,000 (Germans 60,000, French 30,000, Dutch 15,000, Poles 12,000, Italians 7500, Swiss 5000). The number of Jews is about 40,000. The special foreign district of London is that of Soho; another foreign district lies in the neighborhood of Ratcliff Highway, now St. George Street. The lower-class Jews inhabit the neighborhood of Houndsditch and Aldgate. The Italian street musicians and vendors of ices form a small colony near Hatton Garden.

Tables of population.

Table II. shows the percentage of the population of London to the rest of England, the numbers before 1801 being only approximate; Table III. the areas, houses, and population of London in various governmental divisions; Table IV. the population of the several registration districts at different periods from 1801. Pop. Greater London in 1907, 7,217,941; Registration London, 4,758,218.

Streets.

STREETS, BRIDGES, etc.—By the non-adoption of Wren's plans the opportunity afforded through the great fire was forever lost of constructing a model capital, and within the City limits the streets are still in many cases confused and intricate. The total absence of plan in the construction of the nucleus of London has doubtless tended to aggravate the confusion outside the old boundaries. The growth of the immense new outer city was, moreover, for centuries totally unregulated by the control of any central authority. The principal lines of streets formed along the old public highways are insufficient as main lines of communication for the increased population, and the absence of direct connection between important points causes traffic to be enormously impeded. The longest line of street communication in London is that which is formed by the junction of the lines of the Edgeware and Uxbridge Roads at the Marble Arch, whence it extends eastward by Oxford Street, Holborn, Newgate Street, Cheapside and other important City streets, Whitechapel Road, and Mile End Road to Bow. At Cheapside a branch from it runs westward by Fleet Street, the Strand, Haymarket, Piccadilly, and Knightsbridge to Kensington. Much of the effect of the fine architecture of the City streets is totally lost from promiscuous crowding, and the main connecting streets between the City and the West End display, at certain parts, much meanness and incongruity. Regent Street, the most fashionable thoroughfare of London, possesses ample width, and the splendor of its shops to some extent atones for the plain monotony of its regular architecture. In Oxford Street, which ranks next to it in importance, many buildings of a more ornamental character have lately been erected. Piccadilly, the eastern half of which is occupied chiefly by shops, and the western by dwelling houses and clubs, is a medley of every species of architecture, but is to some extent effective from the variety of its contrasts, and its outlook to the Green Park. Trafalgar Square, with its fountains, its Nelson column, its statues, and its wide expanse, has an airy and pleasant effect, but the huge erections which surround it are a very miscellaneous group, and few of them are worthy of the site. The clubs and hotels in Pall Mall and its neighborhood represent every variety of Grecian and Italian architecture. The private houses in the more fashionable regions are not remarkable for external beauty, but in summer time flowers and foliage give the West End squares and terraces a bright and pleasant aspect. A special characteristic of London is the enormous space covered by the suburban cottages and villas of the middle classes. Close to the most fashionable regions there are many mean back streets tenanted by workmen, but the principal territories of the working classes are comprehended in the dense and dreary districts east and south-east of the City. The improvements lately carried out in the City and other central districts, and the substitution of business premises for dwelling houses, have compelled large numbers of these classes to live at a long distance from their work, and also caused undue crowding in the less remote regions. The running of workmen's trains from the suburbs and the efforts of various private building associations and of the Metropolitan Board, guided by the Artisan and Laborers' Dwellings Improvement Act, have only partially mitigated these evils.

Street improvements.

Since 1785 the greater part of London within the city limits has been rebuilt, and its streets have been much altered, the principal improvements being the reconstruction of the lines from London Bridge to Finsbury Pavement, and from Blackfriars Bridge to Farringdon Road, both intersecting the City from north to south; the rebuilding of Bartholomew Lane, Lothbury, Threadneedle Street, and Cannon Street from King William Street to St. Paul's; and the construction, in conjunction with the Metropolitan Board, of the Holborn Viaduct and of Queen Victoria Street from Blackfriars Bridge to the Mansion House. The Metropolitan Board now exercises a certain control over the formation of new streets, but its powers are hampered by previous circumstances and by various restrictions. The principal new thoroughfares opened up by the board, besides Queen Victoria Street and the Holborn Viaduct, are Garrick Street,

Covent Garden (1861), Southwark Street (1864), Northumberland Avenue (1876), and Theobald's Road and Clerkenwell Road, begun in 1873 to connect Oxford Street and Old Street. They have also effected extensive improvements in the neighborhood of Whitechapel, Shoreditch, Park Lane, and Kensington. The more important schemes in contemplation are a new street from Tottenham Court Road to Charing Cross, another from Oxford Street to Piccadilly Circus, the widening of Coventry Street, of Gray's Inn Road, and of Tooley Street, and alterations of a less extensive character at Kentish Town, Hackney, and Camberwell. A scheme has been put forth by Government to relieve the pressure at Hyde Park Corner. Altogether up to 31st December, 1881, the board have expended in street improvements £6,531,856, of which probably one-third will be defrayed by sales of property. In addition to this over £4,000,000 have been spent on the Thames Embankment and Queen Victoria Street, and the board have contributed about £626,077 to defray local improvements by district boards and vestries, as well as £1,360,500 for artisans' dwellings.

Thames Embankment.

The Thames Embankment, with its marine wall of large granite blocks facing the river, supports on the north side a spacious thoroughfare which forms one of the finest promenades in London. The total cost of the various portions of the embankment was over £3,000,000, the greater part of which is being defrayed by the coal and wine duties levied by the City corporation. By the construction (1864–70) of that portion known as the Victoria Embankment, stretching from Blackfriars Bridge to Westminster, about 37 acres of land have been reclaimed, of which 19 are occupied by carriage and footways, 7½ have been conveyed to adjoining proprietors, and about 8 have been formed into ornamental grounds. The Albert Embankment (1865–68), stretching on the south side of the river from Westminster Bridge to Vauxhall Bridge, includes about 9 acres, which are now chiefly occupied by St. Thomas's Hospital. The Chelsea Embankment (1871–74), which is the extension of one previously constructed between Vauxhall Bridge and Chelsea Hospital, involved the reclamation of about 9½ acres of ground, now occupied partly by a roadway 70 feet wide, and partly by a flower garden.

Bridges.

There are twelve bridges, other than railway bridges, over the Thames within the metropolitan area, the most easterly being London Bridge and the most westerly Hammersmith Bridge. Three of these, London Bridge, Southwark Bridge, and Blackfriars Bridge, are within the City area. New London Bridge, a noble structure by Rennie, was opened in 1831, having cost £1,458,311. As populous and busy commercial districts extend for several miles to the east of it on both sides of the Thames, it is not only totally inadequate for the requirements of traffic, but is also removed beyond many convenient lines of communication. On this latter account the proposal to widen it—in itself a very unsatisfactory plan—has met with almost no support; but a bill promoted by the Metropolitan Board for erecting a high level bridge at the Tower failed also to commend itself to a committee of the House of Commons. Until 1769, when the Blackfriars Bridge was erected, London Bridge stood alone. Old Blackfriars Bridge was replaced in 1869 by the present one of five iron arches resting on granite, erected from the designs of Page at a cost of £320,000. Southwark Bridge, designed by Rennie, 1815–19, consists of three iron arches of great elegance resting on stone piers, and cost £800,000. Partly from the unsuitability of its approaches, it has not proved of very much service.

The number of passengers and vehicles passing over the London and Blackfriars Bridges in a single day of 1823 is given in the July number of the *Monthly Review* for that year, and in 1881 similar information was obtained, in regard to the three bridges, for the traffic in the direction of the City. Multiplying these figures by two, we find that the foot passengers crossing London Bridge in 1823 numbered 89,640, while in 1881 they were 157,886, and that the number of vehicles had increased from 6182 to 21,466; that over Blackfriars Bridge the passengers had increased from 61,069 to 87,134, and the vehicles from 4047 to 14,584, while 30,090 passengers and 3560 vehicles passed over Southwark Bridge, the increase in the number of passengers over the three bridges being thus 124,401, and of vehicles 28,381. At the earlier date Southwark Bridge was practically unused, but in 1865 the toll was abolished, and the bridge purchased by the corporation for £218,868. The Metropolitan Toll Bridges Act of 1877 required the Metropolitan Board to extinguish the tolls on all the Thames bridges and the bridge over Deptford Creek, and thereafter to repair and maintain them, the county authorities of Middlesex and Surrey paying each £1200 a year towards their maintenance. The bridges freed by the Act were the Charing Cross foot-bridge, for which £98,540 was paid to the South-Eastern Railway; Waterloo Bridge (1811–17), designed by Rennie in a style similar to London Bridge, constructed at a cost of £1,000,000, and purchased for £475,000; Lambeth Bridge (1862), built of iron at a cost of £40,000, and purchased for £36,049; Vauxhall Bridge (1811–16), similar in form to Southwark Bridge, erected for over £300,000, and purchased for £225,230; Chelsea Suspension Bridge (1858), designed by Page, erected by the Government for £88,000, purchased for £75,000; the Albert Suspension Bridge (1873) and Battersea Bridge, an old wooden structure, both purchased for £300,000; Wandsworth Bridge for £52,761; Putney Bridge (1729), a picturesque old timber structure, for £58,000; and Hammersmith Bridge for £112,500. Battersea and Putney bridges are about to be re-erected, and Deptford Creek Bridge is to be widened and improved at a cost of £109,091. The total amount of money spent by the board in connection with bridges up to 18th December, 1881, was £1,479,697. The amount to be paid by the board for their maintenance in 1882 is estimated at £90,502. The river is crossed by many railway bridges, and the Thames tunnel, begun in 1825 and completed in 1843, at a cost of £468,000, for the purposes of traffic, was purchased in 1865 by the Great Eastern Company, and is now used as a railway tunnel. A subway under the Thames from Tower Hill to Tooley Street was constructed in 1869 at a cost of £16,000. The communication in the neighborhood of the river is greatly facilitated by the frequent passenger steamers.

Maintenance of streets.

The cleaning, watering, and paving of the streets are more satisfactory than might be expected from the fact that each district depends solely on its own local authority. Several Acts for paving the Strand were passed in the 14th century, and in the 16th century for the streets outside the City. In 1614 the citizens began to pave the margins of the streets before their doors, but the middle of the streets were laid with large pebbles very unevenly. In 1661 the money obtained from hackney coach licenses, £5 for each annually, was applied to keeping them in repair. The use of squared granite blocks, with raised footways, was introduced by Acts of Parliament for Westminster in 1761, and for London generally in 1766. Within the last twenty years asphalt and wooden pavement have been largely substituted for granite in the principal thoroughfares.

Conveyances.

Hackney coaches are first mentioned in 1625, when they were kept at inns, and numbered altogether only 20. In 1652 their number was limited to 200, in 1662 to 400, in 1694 to 700, in 1715 to 800, in 1771 to 1000, and in 1799 to 1200. In 1832 the restriction of their number was abolished. The number of cab drivers in 1871 was 10,043, and of cabs 7818, of which 3295 were hansoms and 4523 four-wheelers; in 1881 the number of drivers was 12,630, and of cabs 9652, of which 5805 were hansoms and only 3847 four-wheelers. Omnibuses were first introduced in 1829. Many of the principal streets are too crowded for tramways, but in South London tramcars are more used than omnibuses, and there are also several routes in the northern and eastern districts. The Metropolitan and Metropolitan District Railway lines, which run partly underground, and form almost a complete belt round the "inner circle" of London, with several branches intersecting it, and others communicating with various suburban lines, have proved invaluable in relieving the throng of vehicles on the streets, and in affording rapid communication between important points; but the railway system in and around London has suffered greatly in directness from the absence of a complete plan embracing proper connecting links between the lines of the several companies. The annual number of passengers on the Metropolitan Railway is now about 60 millions. The Regent, Grand Junction, and several other canals, besides connecting London with the

internal navigation of England, supply a means of transport for heavy goods between various districts of the metropolis.

Postal districts.

London is divided into eight postal districts, viz., Eastern Central (E. C.), Western Central (W. C.), Northern (N.), North-Western (N. W.), Western (W.), South-Western (S. W.), South-Eastern (S. E.), and Eastern (E.). In the E. C. district there are twelve deliveries of letters daily, in the town portions of the other districts, which extend to about 3 miles from the General Post-Office, eleven deliveries, and in the suburban portions six deliveries.

Royal parks.

Open Spaces.—London owes the possession of its finest parks rather to accident than to intention. Eastwards and northwards no effort was made to preserve any part of the "delightful plain of meadow land interspersed with flowing streams," mentioned by Fitzstephen, or of the "immense forest of densely wooded thickets," or of the "common fields" in the great fen, notwithstanding the riot of the citizens in the reign of Henry VIII. against the invasion of their rights by enclosure. Westward, however, the inroads of the builder were interrupted by the royal parks, which, lying adjacent to each other, cover an area of about 900 acres. St. James's Park, 80 acres, transformed from a swamp into a deer park, bowling green, and tennis court by Henry VIII., extended and laid out as a pleasure ground by Charles II., and rearranged by Nash (1827–29), possesses beautiful combinations of water and foliage. Green Park, 70 acres, lying between St. James's Park and Piccadilly, is unadorned except by rows of trees and by parterres of flowers bordering Piccadilly. Hyde Park, 390 acres, stretches westward from the district of Mayfair to Kensington Gardens. Originally forming part of the manor of Hyde, which was attached to Westminster Abbey, Hyde Park at the dissolution of the monasteries was taken possession of by Henry VIII. In 1652 the park, which then included a large portion of the ground now joined to Kensington Gardens and extended to 621 acres, was sold for £17,068, 6s. 8d., but in 1660 it was rebought by the Crown, having some time before this become the great "rendezvous of fashion and beauty." It possesses nine principal gateways, of which that at Hyde Park Corner on the south-east and the Marble Arch on the north-east present the most striking features. The former, designed by Decimus Burton and erected in 1828 at a cost of £17,000, consists of three imposing arches adorned with rilievos copied from the Elgin marbles. The Marble Arch, originally intended as a monument to Nelson, was first erected at a cost of £80,000 in front of Buckingham Palace, and was placed in its present position in 1851. With its fine expanse of grass, its bright flower beds and clumps of shrubbery, its noble old trees, its beautiful ornamental lake the Serpentine, its broad avenues crowded with equipages, its Rotten Row alive with equestrians, its walks lined with thousands of loungers of very various nationalities, professions, and grades of social position, Hyde Park in the height of the season presents a scene which in the brilliancy of its *tout ensemble* and its peculiarly mingled contrasts can probably be paralleled nowhere else. In the 17th and 18th centuries Hyde Park was a favorite meeting place for duellists, and in the present century has been frequently the scene of great political gatherings. To the west are Kensington Gardens, 360 acres, originally attached to Kensington Palace, and enlarged in the reign of George II. by the addition of nearly 300 acres taken from Hyde Park. They are more thickly planted than the "Park," and also contain an avenue of rare plants and shrubs, and several walks lined with flowering trees. Regent's Park in the north-west, 470 acres, occupying the site of Marylebone Park, which in the time of Elizabeth was used as a hunting ground, owes its preservation to the intention of George III. to erect within it a royal palace. It contains the gardens of the Zoological Society and of the Royal Botanic Society, as well as the grounds of a few private villas. The northern half of the park is in summer devoted to cricket; in the south-east corner there is a flower garden of rather antique design; and in the south-west a portion bounded on the north by an artificial lake is let to private householders. To the north of Regent's Park there are about 12 acres of open ground surrounding Primrose Hill, 220 feet, commanding an extensive view of London.

Other parks.

Battersea Park, 180 acres, formed (1852–58) at a cost of £312,890, on the south side of the Thames, besides a fine promenade along the banks of the river, several walks and carriage drives bordered with parterres, and a wide expanse for cricket and other amusements, contains a subtropical garden, which during August and September possesses much of the witchery of an ideal fairy-land. East London, after the enclosure of Finsbury Fields, had no special recreation ground until the opening of Victoria Park, which was sanctioned by an Act of Parliament in 1842, and was in 1872 increased to about 300 acres. Finsbury Park, 115 acres, formed by the Metropolitan Board of Works from the grounds of Hornsey Wood House at a cost of £112,000; Southwark Park, Rotherhithe, 63 acres, formed at a cost of £111,000; West Ham Park in the extreme east, partly purchased by the City corporation; Greenwich Park (see Greenwich); and the gardens on the Thames Embankment, with various squares and semi-private gardens, sum up the other ornamental open spaces of London.

Public commons.

The Metropolitan Board, under various Acts of Parliament, have secured the exclusive right of the public in several commons and open spaces, which with the parks under their care comprise together an area of 1698 acres, giving with the royal parks and Battersea Park, Victoria Park, and West Ham Park a total of over 3000 acres, or about a twenty-fifth part of the whole metropolitan area. The principal public commons are Hampstead Heath, a wild hilly region now encroached on by buildings on all sides except the north and north-west, commanding fine views both of London and the country, and, with its clear bracing air and its unkempt and rugged beauty, breaking on the visitor with all the effect of a sudden surprise; Blackheath Common, 267 acres, a bare sandy expanse to the south of Greenwich Park, containing a good golfing course; Clapham Common, 220 acres; Wormwood Scrubs, 194 acres; the Tooting Commons, 207 acres; and Plumstead Common, 110 acres. The total sum expended by the Board of Works in the purchase, preservation, and adornment of parks and open spaces up to 31st December, 1881, was £436,760. All the parks and open spaces already mentioned are included in the Metropolitan Board district, but outside this area there is in the neighborhood of London a large number of uncultivated spaces to which the public have various rights, some of them of an obscure and undefined character. A return made to the House of Commons in 1865 gives the area of public commons within radii of 25 miles and of 15 miles of the metropolis, the area of those within the smaller circuit being 13,301 acres. Of Epping Forest 5600 acres have been secured to the public by the corporation of the City, and in 1871 an Act was passed for the preservation of Putney Heath and Wimbledon Common, but Hounslow Heath, of old the favorite resort of highwaymen, and at one time over 4000 acres in extent, is now nearly all under cultivation. Richmond Park, the grounds of Hampton Court Palace, the gardens at Kew, the fine surroundings of the Crystal and Alexandra Palace, the cricket grounds at the Oval and Lord's, may practically be also reckoned among the public parks of London. In addition to this the river Thames itself supplies facilities for recreation which are safe from the inroads of the builder; and all round the metropolis there are numerous footpaths through the open fields.

Water supply.

Water Supply.—For two centuries after the Conquest, London obtained a sufficient supply of pure water partly from the rivers or streams which passed through it and partly from

wells sunk into the sands above the chalk. Holywell, Clerk's Well (Clerkenwell), and St. Clement's Well (near St. Clement's Inn) are mentioned by Fitzstephen as those "of most note." In 1236 the magistrates purchased from Gilbert Sanford the liberty to convey the waters of the Tyburn from Paddington in leaden pipes to the city, and a great conduit of lead castellated with stone was begun in West Cheap in 1285. Various other conduits were built in the 14th and 15th centuries, some for the water of the Thames, from which also the inhabitants were supplied by the city company of water-bearers, who brought it in leathern panniers slung on horses. In 1582 a great step in advance was taken by Peter Moris, a Dutchman, the real originator of the Thames water companies, who erected a "forcier" on an arch of London Bridge to convey the Thames water into the houses in the east end of the city as far as Gracechurch Street; in 1594 another was erected near Broken Wharf for West Cheap, Fleet Street, and the district round St. Paul's, and in 1610 a third at Aldersgate without the gate. Moris, who obtained the lease of one arch of London Bridge for five hundred years at a rental of 10s. per annum, and two years later the use of another arch, erected for his purpose very ingenious machinery; and the works continued until 1701 in the possession of the family, who after amassing large wealth sold the lease to a company for £30,000. They ultimately occupied four arches, and continued till 1822, when the supply was purchased by the Southwark Company for £10,000. In 1605 an Act was passed for supplying the northern districts from springs near Ware in Herts. This enterprise was in 1609 undertaken by Hugh Myddleton, who, when his funds became exhausted in 1612, received the necessary money from James I. on condition of his sharing in the profits. With this assistance the reservoirs at Clerkenwell supplied by the New River were opened in 1613. In 1630 a scheme to bring water to London and Westminster from Hoddesden in Herts was promoted by aid of a lottery licensed by Charles I. on condition that the promoters should pay £4000 per annum into the king's treasury. Strype, writing in 1720, mentions that "there is not a street in London but water runs through it in pipes conveyed underground, and from those pipes there is scarce a house whose rent is £15 or £20 per annum but hath the convenience of water brought into it," while "for the smaller tenements there is generally a cock or pump convenient to the inhabitants." In 1721 the Chelsea Water Company began to supply water from the Thames to Westminster and the parts adjacent, and in 1783 the supply of south London was supplemented by the erection of the Lambeth waterworks opposite Charing Cross. The Vauxhall Company was established at Vauxhall Bridge in 1805, the West Middlesex near Hammersmith in 1806, the East London on the River Lea at Bow in the same year, the Kent on the Ravensbourne at Deptford in 1810, the Grand Junction at the Grand Junction Canal in 1811, and the Southwark at London Bridge in 1822. For several years before the interference of parliament the companies had agreed to restrict themselves to separate localities. The Acts of 1847 required the companies to provide pure and wholesome water for the use of the inhabitants in the districts supplied by them, and also to provide water for general use. An Act passed in 1852 compelled the removal of the companies beyond the tidal limits of the Thames, contained regulations as to rates, enforced thorough filtration, and endeavored to make provision for a constant supply. The rates, which differ in the various companies, were in some respects amended by the Act of 1871; but, as it fails to guard against claims for back dividends, no sufficient guarantee is provided against the raising of the rates. These are charged chiefly on the value of the houses, but the Acts do not distinguish with sufficient clearness between the gross annual value and the rental. A proposal in 1880 to purchase the rights of the companies, whose capital was then a little over £12,000,000, for £34,160,000, failed to commend itself to a committee of the House of Commons.

The water companies.

Their accounts being made up at different periods, it is impossible to give comparative returns for the companies; the following are the figures (Table V.), as best they can be stated, for two years:—

	Ordinary Capital.	Preference and Loan Capital.	Total Capital.	Total Expenditure.	Income.	Working Expenses.	Dividends.
1871–2	£7,561,526	£2,520,340	£10,081,866	£10,137,710	£992,610	£389,258	£603,352
1880–1	9,087,917	3,448,981	12,536,898	12,612,589	1,532,784	610,899	921,885
Increase	1,526,391	928,641	2,455,032	2,474,879	540,174	221,641	318,533

Within ten years the increase of capital has thus been about 24 per cent., or 2⅜ per cent. per annum, the increase of the income 54 per cent., or 5⅜ per cent. per annum, and of the expenses 57 per cent., or 5 7/10 per annum. Thus, while in 1871 there was a capital of 10 millions, gaining 6 per cent. profits, in 1881 there was a capital of 12½ millions producing 7¾ per cent. Within the last two years the value of the property has been increasing at a more rapid ratio, and probably at the rate of £1,250,000 per annum; but, as on account of the proposals to buy up the rights of the companies they have at present special reasons for curtailing expenses and delaying the carrying out of all but essential improvements, it is impossible to know how much of the increase is temporary and artificial.

The problem of future supply.

According to Dr. Frankland the water of the Thames and the Lea, notwithstanding the most efficient possible filtration, are, on account of sewage pollution, becoming less and less fit for domestic use, about one-half of the water at present supplied being already grossly polluted, and a very large proportion of the remainder occasionally polluted. He therefore recommends that the supply of water for domestic use should be taken from the springs of the basin before they reach the river. At the present rate of the increase of London the supply required will, however, within forty years exceed that which may be obtainable in the whole Thames basin in times of summer drought, such as may occur in any year, and thus in a future not far distant a means of storage must be provided, or a new source of supply discovered, involving an outlay which would at least double the rates on the present rental. The Kent Company, which obtains its supply from the chalk wells, is the only one possessing wholly unpolluted sources, but the New River Company also obtains about one-tenth of its supply from springs, the remainder being obtained from the Lea. The East London Company obtains its supplies from the Lea and Thames, and the other companies from the Thames alone. The following table (VI.) gives certain particulars:—

Authorized Daily Supply from Thames.	Other Sources.	Average Supply from Thames.	Other Sources.	No. of Supplies to Houses.	Houses on Constant Supply.	Estimated Population Supplied.	Subsidiary Storage.		Filtered Storage.		Miles of Mains in the Metropolis.	Miles of Mains Constantly Charged.
							Area.	Capacity.	Area.	Capacity.		
110,000,000	Not Restricted.	68,000,000	72,000,000	622,000	186,000	4,600,000	Acres. 457¾	Gals. 1,264,350,000	Acres. 46	Gals. 150,087,000	2,707	750

Old methods of lighting.

LIGHTING.—From 1416 the citizens of London were under an obligation to hang out candles between certain hours on dark nights for the illumination of the streets; and in 1661 a special Act of Parliament was passed to enforce the custom. The corporation in 1684 granted a license to Edward Heming, the inventor of oil lamps, for the sole supply of the public lights for twenty-one years, but the duty was then once more assigned to the individual citizens. A second agreement with contractors not proving satisfactory, the corporation in 1736 obtained from parliament permission to erect lights where they thought proper, and to levy a rate, which in that year yielded £15,000. Gas-lighting was in 1807 introduced in Pall Mall by the erection of a small apparatus to supply the lamps on the one side of the street, the other being still lighted with oil. In 1810 the Gas Light and Coke Company received a charter permitting it to supply gas to any persons within "the cities of London and Westminster, and the borough of Southwark," and as the result of their enterprise Westminster Bridge in 1813 was lighted with gas, and in 1814 the whole of the streets of St. Margaret's parish. The City of London Gas Company was formed in 1817, and soon afterwards other seven companies. After several years' wasteful competition the companies came to an agreement in 1857 to restrict themselves to separate localities. This led to the Metropolitan Gas Act of 1860, the only effectual provisions of which were those in reference to the quality of the gas. The City of London Gas Act of 1868, limiting the price of gas within the City to 3s. 9d. per 1000 feet, except in certain cases, was the only other measure of a restrictive character passed before 1876, and previous to this the companies, by amalgamation, and through the favorable terms on which they were allowed to increase their capital and to raise new shares, had enormously increased the value of their dividends. The Act of 1876, from the provisions of which the London Gas Company is exempt, adopted a sliding scale of dividends, one-half of the profits, after a 10 per cent. dividend had been paid, going to the shareholders, the other being applied to reduction in the price of the gas, it being also provided that the price should not be more than 3s. 9d., and that when additions were made to the capital the shares should be put up to auction. The experimental introduction of the electric light by the commissioners of sewers of the City, and by the Metropolitan Board (for the Thames Embankment and some of the bridges), has led the gas companies to provide better lights in some of the more important streets.

The gas companies.

The following table (VII.) will show that the prosperity of the companies[1] has not been affected by the legislation of 1876, and as yet has not materially suffered from the threatened competition of electric lighting:—

	Total Gas Companies Year ending December 30, 1880.	Totals, Year ending December, 1874.	Increase + or Decrease — from 1874 to 1880.
	£	£	£
Amount of capital authorized	12,050,719	10,482,900	+1,567,819
Paid up capital	10,784,961	8,887,286	+1,897,675
Capital remaining to be paid up	1,265,757	1,595,614	−329,857
Loan capital authorized	3,363,167	2,058,667	+1,304,500
Loan capital remaining to be borrowed	1,303,805	329,455	+974,350
Amount of capital on which 10 per cent. is paid	8,032,720	7,246,800	+785,920
Total income	3,988,543	3,703,198	+285,345
Total expenditure	2,794,858	2,767,266	+27,592
Total gas sales	3,015,444	2,914,800	+100,644
Contract for public lighting	221,271	268,297	−47,026
Coal carbonized ....Tons	1,998,254	1,444,996	+553,258
Gas sold for private lights....Ft.	17,012,025	11,648,859	+5,363,166
Gas sold for public lamps.... "	1,124,438	1,074,595	+49,843
Public lamps....No.	60,346	54,119	+6,227

[1] By amalgamation the companies have now been reduced to four:—Gas Light and Coke Company, paid up capital, £7,515,000; South Metropolitan Gas Company, £1,831,990; Commercial Gas Company, £675,845; London Gas Company, £762,126.

Protection from fire.

FIRE EXTINCTION.—Until 1866 the duty of extinguishing fires was in the hands of the fire insurance companies, which in 1832 united in support of one brigade for the whole of London, but only kept a comparatively small establishment, in the central districts of the metropolis. The other districts were protected by small hand-engines kept up by the parochial authorities according to the 14 Geo. III. c. 78. Since the staff of the fire insurance companies was placed under the care of the Metropolitan Board, the number of stations has been increased from 17 to 53, with 4 floating stations, while 11 movable stations have also been provided; the number of engines has been increased from 11 steam and 27 manual to 3 floating engines, 38 steam land engines, and 115 manual; and the number of men has been increased from 130 to 536, in addition to 68 coachmen and pilots. The board has also undertaken the duty of protecting life from fire, which previous to 1867 was discharged by a society supported by voluntary subscriptions, and they at present maintain 137 fire-escapes, which are stationed during the night in the most prominent parts of the metropolis. The total receipts of the brigade in 1880 was £91,545, and the expenses £88,980, of which £56,021 was defrayed by the board, £10,000 was paid by the treasury, and £21,464 was contributed by the insurance companies, at the rate of £35 for every £1,000,000 insured by them. In 1881, the expenses were over £100,000, of which over £60,000 was defrayed by rates. The number of persons endangered by fire during 1881 was 154, of whom 114 were saved and 40 lost their lives. The following table (VIII.) gives a classification of fires since 1874:—

	Number of Fires.			Percentage.	
	Serious.	Slight.	Total.	Serious.	Slight.
1874	154	1419	1573	10	90
1875	163	1366	1529	11	89
1876	166	1466	1632	11	89
1877	159	1374	1533	10	90
1878	170	1489	1659	10	90
1879	159	1559	1718	9	91
1880	162	1709	1871	9	91
1881	167	1824	1991	8	92

Early sanitary regulations.

SANITARY ARRANGEMENTS.—Until 1531 no provision was made for the construction of underground main sewers, notwithstanding that in 1290 the exhalations from the Fleet overcame the incense burnt at the altars in the neighboring churches, and that in 1307 the river, on account of the accumulation of filth, had become inaccessible for ships. The Act of Henry III. in 1531, which provided for the appointment of a commission of sewers, was renewed in 1548 by Edward VI., and extended in its application by James I. in 1607; and subsequently separate commissions were granted as the population extended to other districts. The most important work of the old commission of sewers was the bridging over of the Fleet in 1637. In 1841 this sewer, which drained an area of over 400 acres, was widened at a cost of about £47,000, and at its mouth an iron culvert was provided which carried its discharge into the middle of the Thames. Other main sewers were constructed, but the bridging of them over was carried out slowly and in a very imperfect manner. In early times the nuisances were carried away by the scavengers and the sewage received into wells, which when full were pumped into the kennels of the streets. Until 1848 the discharge of house sewage into the main drainage was forbidden, and the construction of cesspools enforced, the majority of which were unprovided with overflow drains, but after 1810 there was considerable improvement in connection with the introduction of better arrangements for a supply of water. Under the auspices of the Metropolitan Commission of Sewers, created by the Act of 1848, a more satisfactory system of local drainage was enforced; but its action in regard to the main sewage discharge was so dilatory that the pressure of public opinion led to the Metropolitan Local Management Act of 1855 providing for the creation of the Metropolitan Board of Works, in which was vested the care of the main sewers, and to which was entrusted the construction of works for their discharge at a distance from London re

Commission of sewers.

Metropolitan Board.

garded as sufficient to prevent the pollution of the river. Works were commenced in 1859, and completed in 1865 at a cost of £4,607,000, providing three lines of intercepting sewers on the north side of the river, which convey the discharge 11 miles below London Bridge, and two lines on the south side, which convey their discharge 4 miles farther down. These works comprise 80 miles of main intercepting sewers, in addition to four pumping stations to raise the sewage from the lower levels. The total length of the main street sewers entrusted to the board was about 165 miles, one-fifth of which consisted of offensive open sewers, while many of the others were of most defective design or out of repair. The total cost of repairing these sewers, and connecting them with the new main drainage system, was estimated at £800,000, and works to the value of £750,000 have been executed. The sum expended on main drainage and main sewers up to 31st December, 1881, was £5,684,470. The opinion seems to be increasing that the present method of getting rid of the sewage of London is radically wrong, and undoubtedly the sewage discharge may reach proportions which may absolutely demand a new supplemental scheme. For the four years ending 1878, the average daily sewage discharge was 122½ millions of gallons, in 1878 it was 157½ millions, and it is now estimated at 180 millions.

Thames conservancy.

The conservancy of the Thames was in 1857 transferred from the corporation to a body of twelve, nominated by various authorities, and presided over by the lord mayor; and in 1867 the conservancy of the upper reaches from Staines to Cricklade was vested in a board, of which the conservators of the lower reaches formed the majority. Under the auspices of these two boards not only has the navigation of the river been very much improved, but very stringent care has been exercised to prevent its unnecessary pollution. In 1868 the Lea was also placed under the control of a conservancy board. The expenses of the boards are defrayed by tonnage dues, tolls, pier dues, fines, and licenses, and contributions from the canal and water companies.

Street sanitation.

The sanitary condition of the streets and houses is under the care of vestries and district boards, but great variety exists in regard to the efficiency with which the work is performed.

Cemeteries.

An Act passed in 1845 provides for the prohibition of interment in any of the cemeteries within the metropolitan area by order in council, and forbids the construction of new burial grounds within 2 miles of the metropolis except on the approval of the secretary of state. The power of constructing cemeteries for their several districts is granted to the vestries, who may borrow money for this purpose from the Public Works Loan Commissioners, and are required to appoint a board for their management. The commissioners of sewers for the City of London are the burial board for the City parishes. The secretary of state has the power to issue regulations in regard to the construction of cemeteries and the arrangements connected with interment. Among the more important suburban cemeteries are Kensal Green (in which many eminent persons have been interred), Brompton, Hampstead, Highgate, Abney Park, Nunhead, and Norwood.

Climate.

HEALTH.—Apart from the deleterious influence of smoke and defective sanitary arrangements, London must be regarded as exceptionally healthy. Although subject occasionally to rapid alternations of temperature, the climate is generally mild and according to the seasons equable, with an early spring and a long autumn. The following table (IX.) gives a summary of Greenwich meteorology for thirty-two years, 1849–80:—

Weekly Movement of Air in Miles.	Yearly Fall of Rain in Inches.	Mean Dryness of Atmosphere.	Mean Temperature for the Year.	Mean Temperatures for Quarters ending in			
				March.	June.	Sept.	Dec.
1811	24·8	5·9	49·3	39·9	52·7	60·4	44·1

Smoke and fogs.

In 1306, when the population did not exceed 50,000, the citizens of London petitioned Edward I. to prohibit the use of sea coal, and he passed a law making the burning of it a capital offence. John Evelyn, in *Fumifugium*, written in 1661, complains that on account of the increase of coal smoke the gardens no longer bear fruit, and instances various cases in which the smoke had been prejudicial to health, but the influence of smoke in increasing fogs and intensifying their evils seems not to have been appreciable. The smoke-producing area has since then increased from about 3 square miles to over 100 square miles, and the average daily consumption of coals in domestic fireplaces has mounted to about 27,000 tons, or in winter probably to 40,000 tons, which in certain states of the atmosphere produces a cloud of smoke resting for days over the central districts of the town, and shutting out the sun, even when it does not descend in foggy weather as a thick, impenetrable, and partly poisonous mass of darkness. During the fogs of 1879–80 asthma increased 220 per cent. and bronchitis 331 per cent., and in the week ending February 13, 1882, the death-rate, owing to the dense fogs, rose from 27·1 in the previous week to 35·3, diseases of the respiratory organs rising to 994, the corrected weekly average of this class of diseases being 430. The evil is mainly due to the smoke of domestic fireplaces.

Death-rate and birth-rate.

The death-rate of London has steadily declined since the beginning of the century, when it was first exceeded by the birth-rate. A record of the births and deaths of London entitled "Bills of Mortality" was made by the parish clerks in the plague year of 1593, and from 1603 was continued even after the returns had begun to be published by the registrar-general. Though they only included the births of persons baptized according to the forms of the Church of England, and the deaths of persons buried in consecrated ground within the parishes included in the "Bills," and were in many cases very carelessly compiled, they place it beyond doubt that even in years when London was exempt from the plague the rate of mortality required a large immigration from the country to take the place of those who died in London. Previous to 1593 the great plague years were 1349, 1361, and 1369.

The following table (X.) shows the number of births and deaths in the great plague years of the seventeenth century, and the average annual number for every decade in the 18th century:—

Years.	Total Deaths.	Deaths from Plague.	Births.	Excess of Deaths.	Average 10 Years ending	Deaths.	Births.	Excess of Deaths.	Average 10 Years ending	Deaths.	Births.	Excess of Deaths.
1593	17,844	10,662	4,021	13,823	1710	21,461	15,623	5,838	1760	22,001	17,156	4,845
1603	42,042	36,269	4,789	37,253	1720	23,909	17,111	6,798	1770	24,943	19,784	5,159
1625	54,265	35,417	6,783	47,482	1730	27,492	18,203	9,289	1780	23,851	19,248	4,603
1636	23,359	10,400	9,522	13,837	1740	26,492	16,830	9,662	1790	23,080	21,477	1,603
1665	97,306	68,596	9,967	87,339	1750	25,352	14,457	10,895	1800	24,270	22,605	1,665

The average mortality of London in 1881 was 21·6 per 1000, or 1·1 less than that of the twenty other large towns of England, while the rate for England was only 20·5. It is to be remembered that London contains a comparatively small proportion of working class population. Its sanitary condition is still very far in advance of that of Paris, where at present the death-rate is about 130 for 100 in London. The registrar-general calculates that according to the density of London, its normal death-rate should be much lower than it is, but besides the fact that mortality is influenced by other causes than sanitary arrangements, the extended area augments the evil results of density

and the lesser density in some districts cannot counterbalance the excessive crowding of others. Table XI. gives the annual rate of mortality per 1000 persons living for various periods, and Table XII. the number of births and of deaths from the principal zymotic diseases and from all causes:—

TABLE XI.—*Annual Rate of Mortality, 1851–81.*

Area in Square Miles.	Persons to a Square Mile, 1881.	Annual Rate of Mortality per 1000 Persons living.

Marriage-rate.

The mean marriage-rate for ten years 1870–79 was 19·2, and for 1880 it was 18·1. The percentage of children born out of wedlock in 1880 was 3·9, that for England being 4·8.

Provision markets.

MARKETS AND FOOD SUPPLY.—A regulation passed in 1277 ordained that no market should be kept on London Bridge or elsewhere except in places specially appointed for the purpose, and that no person should buy wares in Southwark that were to be bought in the City. In 1322 a decree was issued by the mayor that none should sell fish or flesh "out of the markets appointed, to wit, Bridge Street, East Cheap, Old Fish Street, St. Nicholas shambles, and Stocks market;" and in 1328 a charter was granted to the corporation by Edward III., conveying to it the sole right to establish markets within 7 miles' circuit of the city. In 1345 a proclamation was passed that poultry instead of being sold in lanes or hostels should be brought to Leaden Hall, and in the same year it was decreed that butchers and fishmongers should sell in the enclosed place called the "Stokkes," and not in the king's highway. After Acts passed in 1351 and 1382 on behalf of aliens and foreigners, all regulations formerly made in reference to the sale of provisions in London were repealed, and the dealers placed under the control of the mayor and aldermen, thus confirming a system of public markets and bazaars even for the retail trade, which remained almost inviolate till the time of Edward VI., up to whose reign there was, according to Stow, scarcely such a thing as a shop between Westminster and St. Paul's. The system, though now broken up even in regard to provisions so far as the retail trade is concerned, remains intact in regard to the vending of certain provisions wholesale, and still exercises a considerable influence on general retail. The principal markets mentioned by Stow are Smithfield, Bartholomew Fair, Leaden Hall, Grass Church (Grace Church) market, chiefly for corn, meal, and cheese; East Cheap flesh market, the adjoining alley to which, Red Rose Lane, had by this time received the less idyllic title of Pudding Lane, on account of the butchers making use of it for the disposal of the offal before transferring it to their dung-boats on the Thames; Newgate market for corn, afterwards for meat; St. Nicholas shambles; Stocks market, established in 1282 on a place occupied by public stocks, and rebuilt in 1410, for flesh, fish, and poultry; and the fish market in Old Fish Street. He also states that in 1302 bread was sold in Bread Street in the open market. Before the great fire Stocks market was occupied by greengrocers, the important vegetable market at Honey Lane had also been established, and markets, chiefly for meat and fowls, were held at Holborn Bars and outside Temple Bars. The increase of the population led in 1657 to the establishment by Lord Clare of Clare market, which, though now frequented only by a very humble class of buyers, was declared a free market by a special Act of Cromwell's parliament, and was for a long time one of the principal markets for all kinds of provisions. Other markets subsequently established were those of St. James by the earl of St. Albans, Bloomsbury by the earl of Southampton, Brook market by Lord Brook, Hungerford market, Newport market, Haymarket, and Mayfair. Newport market for meat still exists, but the others have been gradually superseded. The principal markets now existing are Smithfield (central meat market and poultry market), Leadenhall (poultry and game), Billingsgate (fish), Covent Garden (fruit and vegetables), the cattle markets at Copenhagen Fields and Deptford, the Bermondsey leather market, and the Cumberland, Smithfield, and Whitechapel hay markets.

Old Smithfield market.

A market for horses and cattle was held at Smithfield (*Smoothfield*) in the time of Fitzstephen, and doubtless long anterior to this. The priory of St. Bartholomew in Smithfield obtained from Henry II. the privilege of a fair for drapers, which was kept three days yearly, originally in the churchyard at a considerable distance from the place occupied by the cattle market, and latterly became a scene of great riot, until it was abolished in 1853. A year later the cattle market was removed to Copenhagen Fields. There were 80 butchers in London and suburbs in 1533, each of whom killed 9 oxen weekly, which in forty-six weeks, none being killed in Lent, would amount to 33,120 yearly. In John Erswick's *Brief Note of the Benefit of Fish Days* (1593), it is estimated that 60 butchers, freemen of the city, killed each 5 oxen weekly, or altogether 300 per week, and that the foreigners or non-freemen killed four times as many, or 1200 weekly, the total number of cattle annually killed being thus 69,000. By Richard II. a law was passed enacting that no flesh should be killed in London but at Knightsbridge or such like distance from the city, but in the time of Stow the slaughter-houses of the freemen butchers were in Pentecost Lane adjoining St. Nicholas shambles and near the Butchers' Hall. Probably the arrangements in regard to slaughter-houses were then more advanced in London than they are now, for, although sufficient slaughter-houses to dispose of all the cattle sold at Copenhagen Fields have been erected adjoining the market, a very large number of cattle are still killed in underground cellars, which, notwithstanding the superintendence of the Board of Works under the Slaughter-Houses Act of 1874, are in the majority of cases totally unsuited for the purpose. The number of these slaughter-houses before the passing of the Act, when they were licensed by the justices, was 1429; but they have now been reduced to a little over 900. The following table (XIII.) gives the average yearly number of sheep and cattle sold at Smithfield at various periods from 1731 to 1854, when the market was removed:—

	Cattle.	Sheep.		Cattle.	Sheep.
1731-1740	95,601	583,713	1842-1846	185,529	1,523,850
1751-1760	86,271	648,684	1847-1851	226,856	1,480,614
1791-1800	124,695	757,672	1852-1854	266,279	1,521,923
1801-1810	131,318	951,940	1854	263,008	1,539,380

Copenhagen Fields and Deptford markets.

The market at Copenhagen Fields, Holloway, covers upwards of 20 acres, and was erected at a cost of £441,000, with accommodation for 6616 bullocks, 34,980 sheep, 1425 calves, and 900 pigs. Deptford foreign market, which occupies the site of Deptford dockyard, and was bought for £100,000, has an area of 22 acres. The following table (XIV.) gives the number of cattle, sheep, and pigs sold at the metropolitan markets since 1870:—

	Cattle.					Sheep.					Pigs.				
	Home Supply. Metropolitan Cattle Market.	Foreign Supply.			Total.	Home Supply. Metropolitan Cattle Market.	Foreign Supply.			Total.	Home Supply. Metropolitan Cattle Market.	Foreign Supply.			Total.
		Metropolitan Cattle Market.	Foreign Cattle Market.	Total.			Metropolitan Cattle Market.	Foreign Cattle Market.	Total.			Metropolitan Cattle Market.	Foreign Cattle Market.	Total.

Central meat market.

The Central London meat market, opened in Smithfield in 1868 at a cost of about £250,000, to supersede Newgate market, is built in the Italian Renaissance style, with towers at the four corners, and occupies about 3 acres, its length being 625 feet and its breadth 240. Below the market area there is a railway terminus. To the west of the meat market another one-third its size was opened in 1875 for poultry and provisions. From 1869 to 1875 the toll received from the meat market increased from £14,220 to £18,272, or 28½ per cent., and with the addition of the poultry and provision market it had increased in 1880 to £24,310, or 71 per cent. The total amount of meat sold in the market in 1879 was 213,614 tons; in 1880 the total amount was 221,448 tons, of which 107,326 tons were country-killed, 80,905 town-killed, 7381 foreign, and 25,836 American, the amount of American meat in 1876 being only 5513 tons. A large quantity of meat is conveyed to the butchers direct without entering the market, and several butchers also buy their cattle and get them killed privately. As, moreover, the cattle markets and the meat market supply towns and villages beyond the metropolitan area, there is a double impossibility of forming from these sales an estimate of the actual amount of butcher's meat consumed in London.

Leadenhall market.

Leadenhall, which according to Stow belonged in 1309 to Sir Hugh Neville, and had been used as a market before it came into the possession of the city in 1411, was enlarged in 1444 by an addition for a granary in connection with the corn market which had been removed to it from Cornhill, the clothes market also following before 1503; and before 1553 the foreign butchers who formerly stood in the High Street off Lime Street had been ordered to take stalls in it. A great part of it in the time of Stow was used as a wool market, but afterwards it became the principal provision market in the city; and, according to Pennant, the Spanish ambassador told Charles II. that he believed there was more meat sold in that market than in all the kingdom of Spain. The Leadenhall underwent improvements in 1713 and 1814; and in 1881 a new structure of elegant design, with an area of 26,900 square feet, and erected at a cost of £50,000, was opened as a market for fowls and game, the principal commodities sold at Leadenhall for many years.

Billingsgate.

Billingsgate, the great fish market of the metropolis, was from an early period a harbor for small ships and boats, and in the time of Stow had almost superseded its great rival Queenhithe, which was in the possession of the Crown. As it grew in importance fish stalls were erected in its neighborhood, but the original market for fish was in Fish Street; and Friday Street, Cheapside, which received its name from being inhabited by fishmongers who served Friday's market, is mentioned as early as 1303. The Act of 1699, which made Billingsgate a "free market for fish," to some extent interfered with the ancient control of the fishmongers, although the custom of selling fish there had been introduced long previously. Until 1846 Billingsgate was a mere assemblage of wooden sheds. The building erected in that year was succeeded by another in 1877, with an area of 39,000 feet instead of 20,000; but, on account of the deficiency of its communications and its defective internal accommodation and arrangements, the market is totally inadequate. Among several abortive efforts to establish other markets for fish was Columbia market, which was completed in 1869 by the Baroness Burdett-Coutts for over £200,000, and presented as a fish market to the City, but failed to attract salesmen. The City authorities have the intention to utilize the vegetable market in course of erection at Smithfield as a fish market, and a scheme is also being promoted for a fish market in the parish of St. Paul, Shadwell. A fish and vegetable market has been established by the Great Eastern Railway Company at Canning Town. The quantity of fish brought to London by rail is not given by the markets committee prior to 1866, but in 1848 the quantity brought by water alone was 108,739 tons. In 1866 the total brought by water and rail was 132,004, in 1870 it was 117,193, in 1875 only 94,949, but since 1877, when the new market was opened, it has gradually increased from 107,168 to 130,629, or nearly 2000 tons less than in 1866, and scarcely 12,000 more than were brought in 1848 by water alone. There has of late years been a more rapid increase in the quantity of water-borne fish, but the amount brought by rail is at present about two-thirds of the whole. Thus, with a population which since 1851 has increased by two-fifths, the fish supply has practically remained stagnant, while, owing to delay in consequence of increased pressure of traffic, the fish often deteriorate so as to be unfit for human food.

Covent Garden.

Covent Garden market, for vegetables, fruit, and flowers, which occupies the site of a convent garden belonging to Westminster Abbey, seems to have been used as a market very early in the 17th century, and it received a considerable impulse from the discontinuance of Stocks market on account of the building of the Mansion House and also of Honey Lane market, which in 1823 was superseded by the City of London school, while since the removal of Hungerford market to make way for Charing Cross station it has remained the only vegetable and flower market of importance in the metropolis, although vegetables of a cheap kind are sold at the Borough and Spitalfields markets, watercresses at Farringdon market, which superseded the Fleet vegetable market in 1824, and potatoes at the station of the Great Northern Railway. Until 1828 Covent Garden market consisted of an unsightly array of sheds. The present building, erected by the duke of Bedford, though lately much improved, is quite inadequate for its requirements, while the arrangements for the disposal of mud and refuse are very reprehensible.

Tattersall's.

Tattersall's, Knightsbridge, established by Richard Tattersall in 1780, is one of the principal marts in England for riding and carriage horses, and may be regarded as the headquarters of the turf.

Costermongers.

One of the principal difficulties connected with the establishment of new markets in London lies in the inconvenient railway arrangements, which render it impossible to obtain a site that shall have sufficient and direct communication with the several districts of England and with the Continent. The poorer classes obtain a cheap supply of vegetables and other provisions from costermongers and itinerant vendors, who either occupy stands in special localities, especially in the East End, and in High Street (Islington), Hampstead Road, Edgeware Road, and York Road (Somers Town), or hawk them through the streets. The capital possessed in 1861 by these vendors, who then numbered 41,040, was estimated at £40,000, their gross amount of annual trade at £2,700,000, and their annual gains at £900,000. Since that period their numbers, capital, trade, and gains have probably increased at least one-third.

COMMERCE AND INDUSTRY.—London, which was a port of some consequence in the time of the Romans,

Growth of London commerce.

is spoken of by Bede as the "mart of many nations resorting to it by sea and land." The Hanse merchants, protected by a clause of Magna Charta, began in the 13th century to frequent London in large numbers, and, after obtaining liberty in 1236 to land and store the wool imported by them, are supposed to have settled in the Steelyard about 1250, but as early as the 8th century they had begun to frequent Billingsgate, and in 978 King Ethelred had conferred certain privileges on them and on other traders. Probably by the time of Fitzstephen London had become the most renowned mart of the world, with the exception perhaps of Antwerp and Bruges. The foreign merchants received a special charter from Edward I. in 1303, and, notwithstanding occasional interference with their privileges, the Hanse traders, who had erected extensive factories and storehouses near their "Gildhall," gradually absorbed the greater portion of the foreign trade of London, until the incorporation of the Merchant Adventurers of England, in 1505, for trading in wool to the Netherlands. The trade with the Levant, which had become of some importance in the 15th century, soon largely extended, and commercial intercourse was also opened up with Barbary, Guinea, and Brazil. After the abolition of the special privileges of the Steelyard merchants, the trade in wool was transferred almost entirely to the Merchant Adventurers, the annual export of English wool and drapery to Antwerp and Bruges in 1566 being estimated at over £2,000,000. The close of the 16th century was marked by the rapid extension of maritime discovery, and the spirit of enterprise was stimulated by the grant of monopolies to those companies which should first open up communication with undiscovered countries. One of the earliest and most successful of the great maritime companies was the Russian, incorporated in 1553, which, besides establishing an extensive commerce with the ports of Russia, had an overland trade with Persia. The foundation of the Royal Exchange by Gresham in 1566 marked an era in the commercial history of London; and the destruction of Antwerp by the duke of Parma in 1585 left it without a rival as the emporium of Europe. The settlement of many of the Flanders merchants in England gave a great impetus to the manufacture of silks, damasks, and other fine cloths, but from the time of the expulsion of the Steelyard merchants by Elizabeth in 1597 the development of the maritime trade of London was solely in the hands of English companies. The incorporation of the Turkey Company in 1579, of the East India Company in 1600, of the Virginia Company in 1606, and of the Hudson's Bay Company in 1670 must be regarded, not only as the most important events connected with the growth of the port in the 17th and 18th centuries, but as of prime consequence in relation to the social and political history of England.

Present trade.

In the trade of London there is a large excess of imports over exports, arising from the fact that it is specially a mart, and is removed from proximity to any large manufacturing district. The value in 1880 of the total trade of Liverpool, £191,489,838, was nearly equal to that of London, which was £194,043,836, but the value of the imports of London exceeded those of Liverpool by nearly £34,000,000, while the exports of Liverpool exceeded those of London by about £31,000,000. London has almost a monopoly of the trade with the East Indies and China, and has thus become the chief emporium for tea, coffee, sugar, spices, and indigo, and for silks and Eastern manufactures. A great part of the overland trade of London with India has till quite recently been carried on *via* Southampton, which, and also Folkestone, Newhaven, and Dover, may be regarded as virtually ports of London. The value of the imports of Folkestone, Newhaven, and Dover in 1880 amounted together to £24,485,034, and their exports to only £4,432,244; the imports of Southampton were valued at £9,205,183, and its exports at £9,306,326. In the Mediterranean and Levant trade London has now a powerful rival in Liverpool. From European and Asiatic Turkey London imports corn, dried fruits, madder, and various other special products; from Greece currants and olive oil; from Italy olive oil, wine, sumach, oranges, and lemons; from Spain wine and dried fruits; from Portugal and the Azores oranges and wine. Nearly the whole of the French trade with England is concentrated in London, the imports including all the special French manufactures, and large quantities of butter, eggs, vegetables, and corn. It is, however, largely carried on through the southern ports, the value of the imports of silk to Folkestone in 1880 being £3,614,014, and those of London only £260,646, while the imports of eggs at Newhaven greatly exceed those of London, as do also the imports of butter and eggs at Southampton. London absorbs the greater part of the Baltic imports to England, especially timber, corn, cattle, wool, and provisions, the tonnage of the shipping that entered from Germany in 1881 being 634,741, from Belgium 249,161, from Sweden 416,997, from Norway 201,056, from the northern ports of Russia 401,076, and from Denmark 135,634. The tonnage that entered from the southern ports of Russia only amounted to 50,883, but much of this trade is carried on *via* Southampton. The chief imports from Russia are corn, tallow, timber, hemp, linseed, and wool. The fact that the staple manufacture of Lancashire is cotton has enabled Liverpool to gain a superiority over London in the United States trade, with the exception of imports of tobacco from Virginia; but the shipping that entered London from the Atlantic ports of the United States in 1881 had a burden of 670,079 tons, and from the Pacific ports of 3248 tons. From Central America London obtains its chief supply of the finer woods, and also jalap, sarsaparilla, indigo, coffee, and Peruvian bark, and from South America sugar, hides, india-rubber, coffee, diamonds, and various drugs. From Canada the port receives timber, corn, cattle, and provisions, from the Australian islands wool, oil, gold, copper, tin, provisions, and cattle; and it possesses more than half the trade of England with the West Indies, the principal imports being sugar and molasses, fruit, rum, coffee, cocoa, fine woods, pimento, and ginger.

Foreign and colonial trade.

On account of the burning of the records at the custom-house, and the absence of regular parliamentary returns, it is impossible to give a continuous summary of the progress of the shipping before 1816, but the following table (XV) gives the returns of the shipping engaged in the foreign and colonial trade in various years from 1693 to that date, and the yearly average for subsequent periods.

	Entered Inwards.		Cleared.	
	Vessels.	Tonnage.	Vessels.	Tonnage.

Coasting trade.

Since 1873 vessels with ashes and manure have been included in the coasting trade, and therefore the figures after that date show much greater progress than has actually taken place. In 1750 the number employed was 6396, and in 1795 it was 11,964 of 1,176,400 tons. Table XVI. gives details from 1855.

Registered shipping.

The following table (XVII.) gives the number of vessels registered in the port of London in various years from 1701:—

	Vessels.	Tonnage.	Men.		Sailing Vessels.		Steam Vessels.		Total.	
					Vessels.	Tonnage.	Vessels.	Tonnage.	Vessels.	Tonnage.
1701	560	84,882	10,165	1850	2,719	573,427	333	67,916	3,052	641,343
1791	1,842	378,516	30,860	1860	2,411	680,392	527	189,199	2,938	869,591
1800	2,666	568,262	41,402	1870	2,221	774,531	690	294,056	2,911	1,068,587
1819	4,760	894,627	56,948	1881	1,637	506,865	1,072	611,714	2,709	1,118,579

Values of exports and imports.

Declared values of the exports from London have been made at various periods, and are now made annually in the statement of the trade of the United Kingdom. Since 1840 the value has more than quadrupled, being in that year £11,586,037, from which it gradually rose almost without intermission till it was £60,232,118 in 1874, but from that year it declined till in 1879 it was £47,335,753. In 1880 it again rose to £52,600,929, considerably above the average of the four years 1876–79, which was £49,884,673, but as much below the average of 1872–75, which was £57,144,480. No return of the value of the imports is given before 1872, when they were £124,174,141. The value for 1880, £141,442,907, exceeds that of any previous year, the next being that for 1877, £140,332,773, while the average for 1872–75 was £129,449,956, and for 1876–79 £132,754,772. The following table (XVIII.) gives details of the principal imports for 1860 and 1880, and also a comparison with the United Kingdom in regard to the same articles:—

Principal Articles.	1860.			1880.

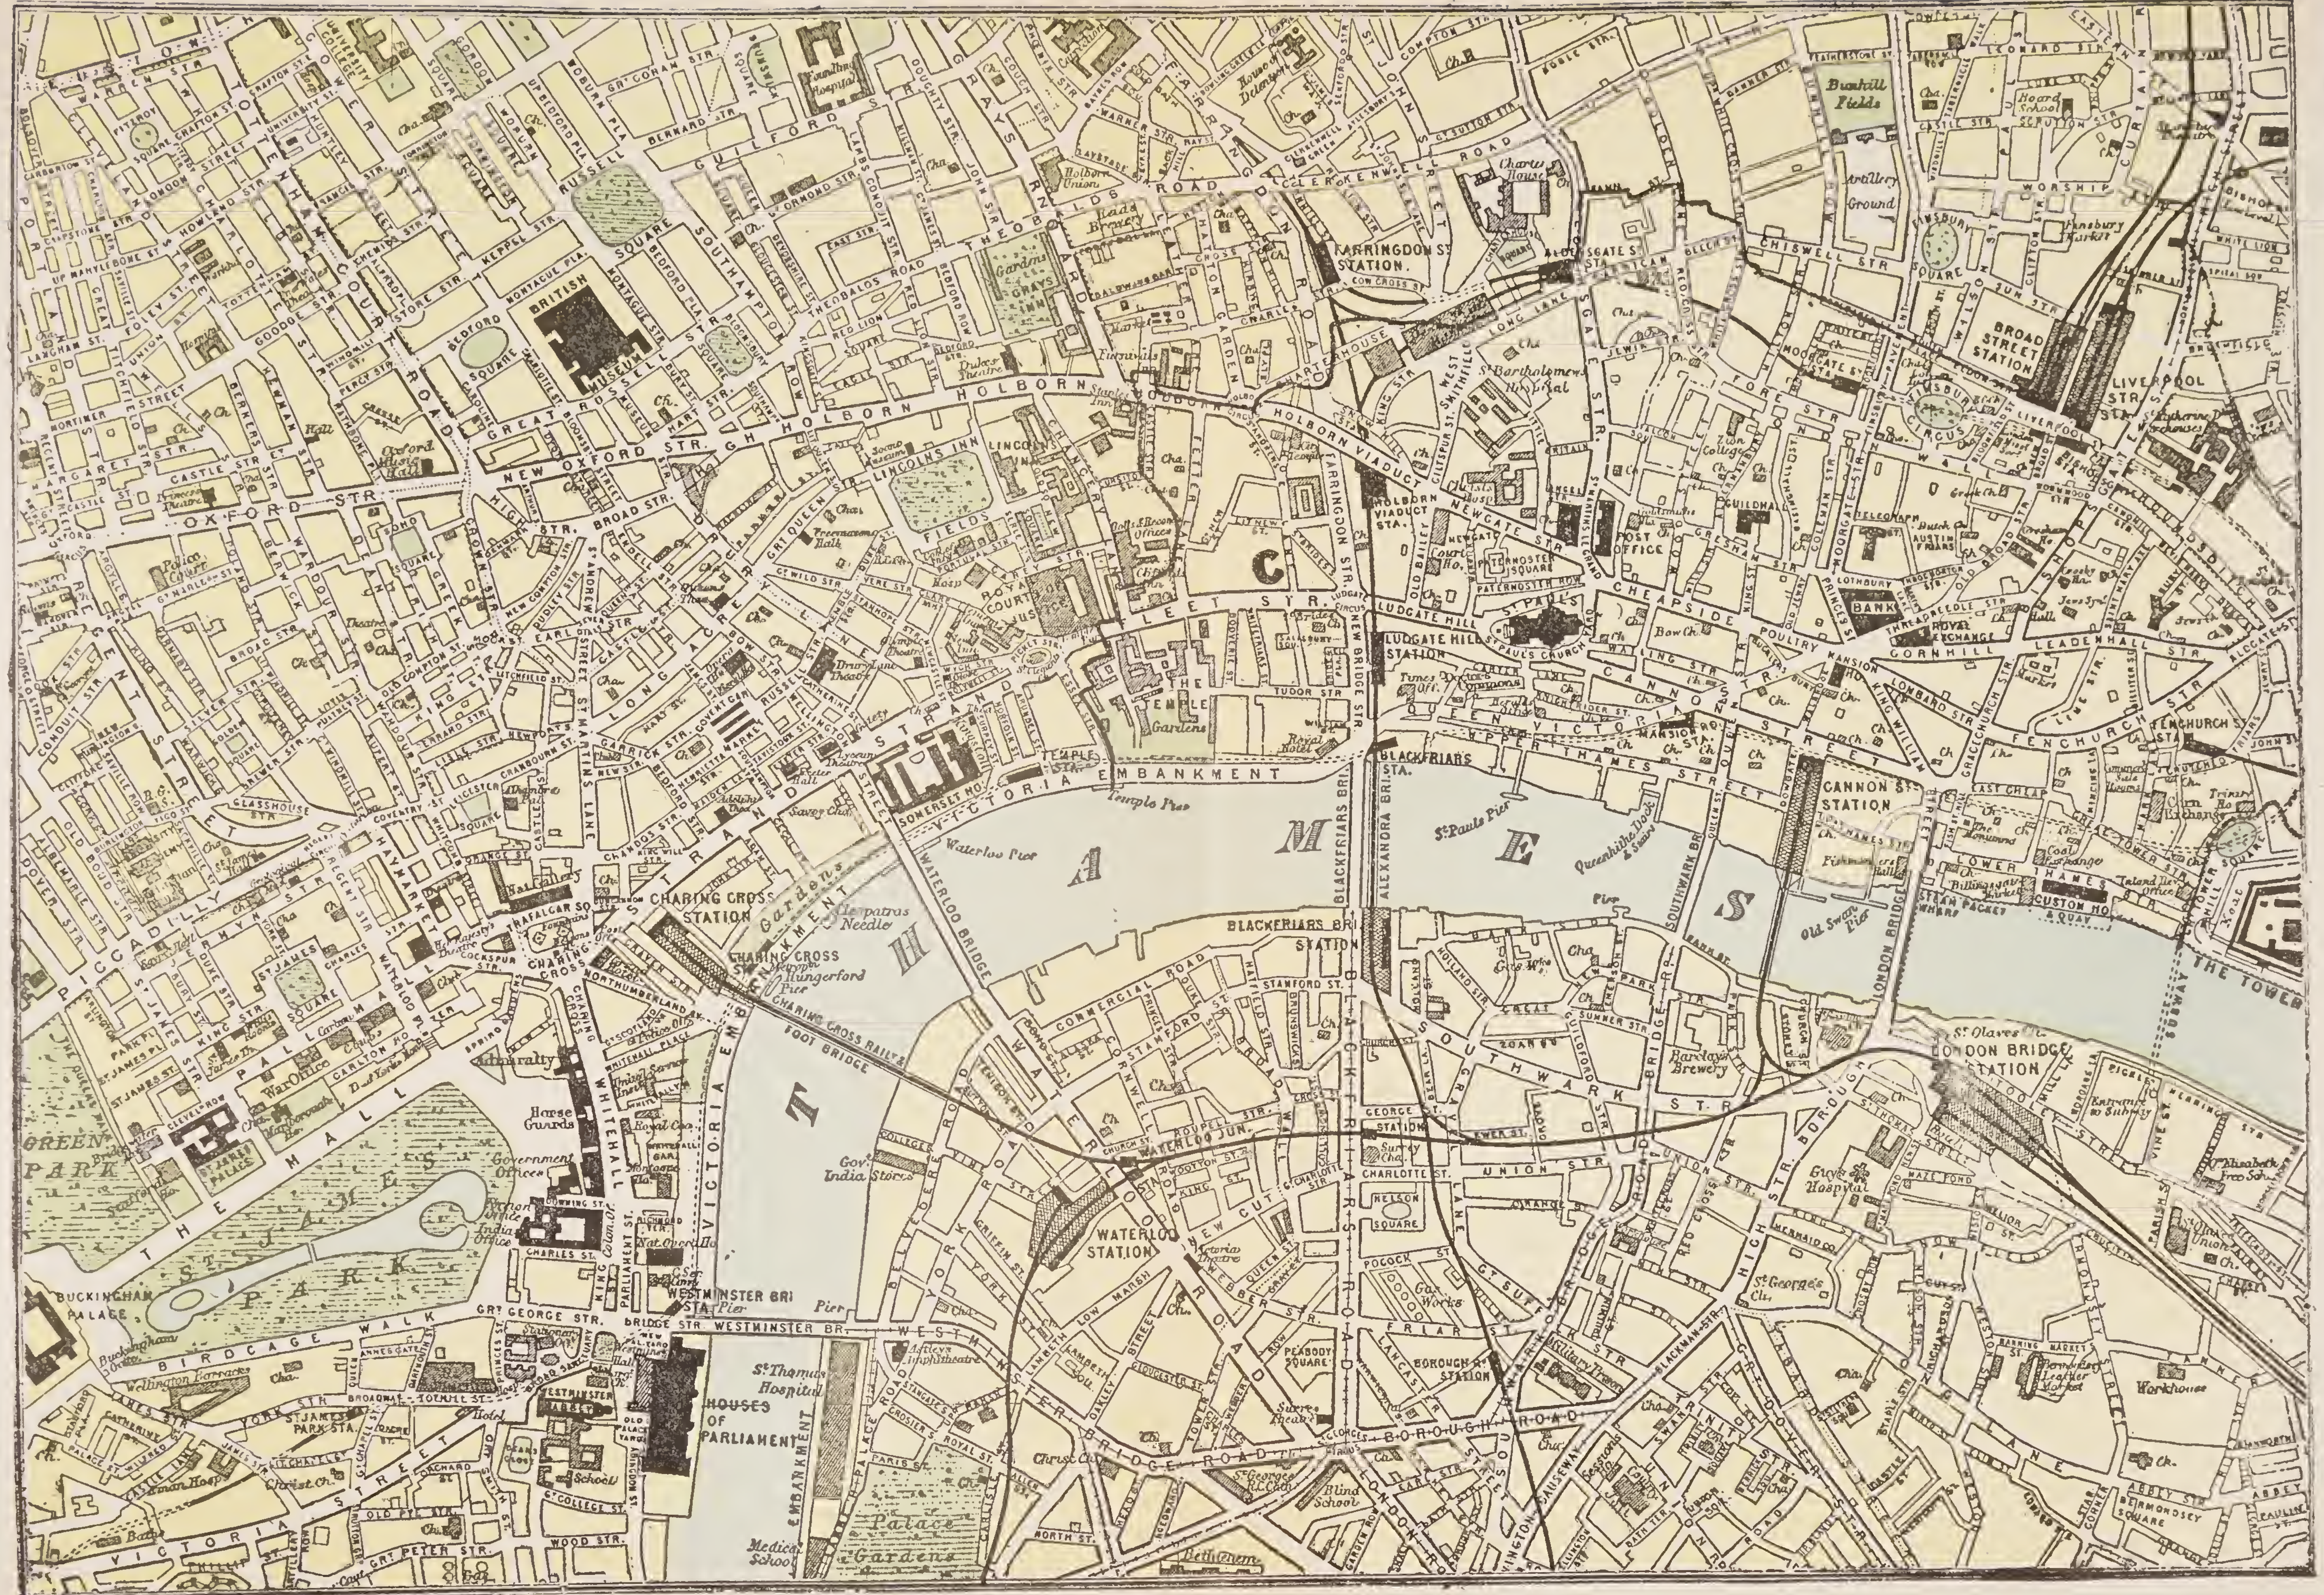
Docks.

In the time of Stow, Billingsgate had begun to supersede Queenhithe as the principal landing place of the port of London; but he also gives a list of other "common watergates," and mentions that there were besides "divers private wharfs and keys all along from the east to the west end of the city, where merchants of all nations had landing places, warehouses, cellars, and stowage of their goods and merchandise." On account, however, of the attempts made to avoid the payment of customs by the use of private landing places, a royal proclamation of Elizabeth appointed certain quays to be used as general landing places and others for special purposes. After the great fire the limits of the port were declared to be the North Foreland and London Bridge; certain wharves named "legal quays" were appointed for the general trade, and others named sufferance wharves were permitted to be used under certain conditions with the special leave of the commissioners. The frontage of the legal quays in 1795 was only 1419 feet, and of the sufferance quays about 3500 feet, and so inadequate was the storage accommodation that it would not have sufficed even for the single article of sugar. After the proposal for the establishment of wet docks was made by the West India Company the system was very rapidly extended. The West India docks at the Isle of Dogs were opened in 1802, the London docks at Wapping in 1805, the East India docks at Blackwall in 1806, St. Katherine's docks to the east of the Tower in 1828, the Victoria docks in 1850, and the Millwall docks at the Isle of Dogs in 1868. The West India Company was granted for twenty years a monopoly of the West India trade, the London Dock Company of the trade in wine, brandy, tobacco, and rice, and the East India Company of the East India and China trade, but in no case were the privileges of the companies renewed. The various docks have at different times undergone improvement and extension to meet modern necessities, the latest addition being the Albert extension of the Victoria dock, opened in 1880, which affords an additional water space of 70 acres, and is unsurpassed in the completeness of its arrangements by any other dock in the world. The St. Katherine's, London, and Victoria and Albert docks are now held by one company, and the East and West India docks by another, who are adding to their accommodation by the construction of the Tilbury docks specially for ocean steamers. All the great merchandise docks are thus on the north side of the river—the Commercial docks,

CENTRAL LONDON.



which date from 1696, and were reconstructed in 1807, and the Surrey docks (1812), on the south side of the river, being used almost exclusively for timber and grain. The position of St. Katherine's docks renders it impossible to adapt them to modern requirements; and probably, on account of the increased use of large ocean steamers, all the older docks may soon be superseded as regards the bulk of the foreign trade. The water area of the docks on the north side of the river, which in 1861 was 272 acres, will soon be 465 acres. The Surrey and Commercial dock, which is very complicated in its construction, has a total area, including land and water, of 330 acres. The land and water area (in acres) of the several docks on the north side of the river at present completed or in process of construction is as follows (Table XIX.):—

Docks.	London.	St. Katherine's.	East and West India.	Victoria and Albert.	Millwall.	Tilbury.	Total.
Water.....	40	10	136	173	36	70	465
Land.....	59	13	210	460	200	530	1,472
Total.....	99	23	346	633	236	600	1,937

Warehouses. The bonded warehouse system was sanctioned in the port of London in 1803, and the exclusive enjoyment for several years of this privilege gave it a great advantage over the other ports of the kingdom. The warehouses of the dock companies, each occupied with their special class of goods, embrace a large portion of the City area, but the rapidity with which goods now pass into consumption renders this kind of dock property at present very unprofitable, and it is probable that very soon many of the warehouses will be turned to other uses.

Custom-house. The Custom-House in Lower Thames Street was built by Laing, 1814–17, but on account of the subsidence of the central part the present Corinthian façade, 490 feet in length, designed by Smirke, was afterwards added. In the building there is a museum containing various old documents and specimens of articles seized by the custom-house authorities.

Trinity House. Trinity House, Tower Hill, a plain building with an ornamental façade, erected in 1793 from the designs of Wyatt, is the seat of an association of mariners which received a charter from Henry VIII. in 1514, and gradually acquired the management of lighthouses and buoys not only on the Thames but on the whole English coast, besides the superintendence of naval arsenals and dockyards. Along with the corporation of the City it had the conservancy of the Thames, until those authorities were superseded by the Thames Conservancy Board. Its general rights and privileges have also been much curtailed since 1853, when it was put under the partial control of the Board of Trade, but it has still the sole charge of the erection and maintenance of lighthouses and buoys, the examination of pilots and of navigating lieutenants; and two of its elder brethren act as nautical advisers in the High Court of Admiralty.

The City The prosperity of that portion of London known as the City is largely due to its proximity to the port, but the rapid development of the trade of the port is closely connected with the increase of London outside the City limits, which is of course dependent on a great variety of causes. The uninterrupted extension of the business and financial transactions of the City, and the connection of these with the rapid increase of the surrounding population, is sufficiently evidenced by the fact that the ratable annual value of the City has risen from about £760 an acre in 1801 to about £5300 an acre in 1881; that the net profits under the commercial and mercantile schedule D for the combined boroughs of the metropolis (1879–80) amounted to £81,088,368, of which the profits for the City alone amounted to £39,263,424, a larger sum than that of the whole seventeen next largest cities and towns of the United Kingdom; and that the number of persons entering the City daily during the sixteen hours of business has increased from 657,379 in 1866 to 739,640 in 1881.

Exchanges. The business centre of London is the Royal Exchange, which occupies a commanding position between Threadneedle Street and Cornhill, at the principal convergence of the City thoroughfares. The first building, erected 1565–70 by Sir Thomas Gresham and presented to the City, was destroyed by the great fire, and the second opened in 1669 was also burnt in 1838. The present exchange (1839–44), designed by Tite and erected at a cost of £180,000, is a quadrangular structure with an imposing Corinthian portico at its principal entrance, and encloses a court surrounded by an ambulatory. It is in the open central area that the commercial transactions take place—the ground floor being occupied by shops and offices, and the principal floor by insurance companies and "Lloyd's rooms." The principal exchanges for special articles are the corn exchange in Mark Lane, where the privilege of a fair was originally granted by Edward I.; the wool exchange in Coleman Street; the coal exchange adjoining the custom-house, erected in 1849 in the Italian style, and consisting of a rotunda surmounted by a dome; and the auction mart for landed property in Tokenhouse Yard. The metal market is a very important one; and there is also a very large consignment of precious metals and diamonds, the workers in which are chiefly concentrated in the neighborhood of Clerkenwell.

The Mint. The Royal Mint, Tower Hill, erected in 1805 on the site of the Cistercian abbey of St. Mary, is the only mint in England for the fabrication of gold and silver coins, but bronze coins are chiefly made at Birmingham, and gold coinage is now also manufactured at Sidney and Melbourne.

Banking. The unique commercial position of London, and its intercourse with every quarter of the globe, have assisted to make it financially in a more complete sense than it is commercially the metropolis of the world. The stock jobbers and brokers, who according to the City census of 1881 numbered 1682, and who have their offices chiefly in the courts and alleys adjoining the Bank of England and the Royal Exchange, are nearly all members of the stock exchange, for whom the present building in Capel Street was erected in 1801; but there is also an open stock exchange in Lothbury. The earliest approximation to banking transactions in London appeared in the negotiations for loans between Elizabeth and the principal city merchants, but the general adoption of the system was due to the civil war, when the merchants, some of whom had already made use of the Royal Mint as a bank of deposit, and the landed proprietors, began to place their money for the sake of greater security in the hands of the goldsmiths. Some of the private banks now existing, such as Coutts's and Child's, date from the 17th century, and a new era in the financial history of London was inaugurated in 1694 by the foundation of the Bank of England, of which a full account is given in the article BANKING (vol. iii. p. 273 *sq.*). Until 1733 the business of the bank was carried on at Grocers' Hall. The present building, which covers about 4 acres, and was enlarged in 1770 and 1788 by Sir Robert Taylor and Sir John Soane, presents to the street a low triangular wall without windows, and almost entirely devoid of ornament except at the north-west corner, which was copied from the temple of the Sibyl at Tivoli. Until the establishment of the London and Westminster Bank in 1834, the Bank of England was the only joint-stock bank in London. The private and joint-stock banks which have offices in London now number over 150. The principal banks are members of the Clearing House near Lombard Street, where a daily exchange of drafts or cheques is effected. For the year ending April 30, 1882, the total amount of bills, cheques, etc., paid at the Clearing House was £6,382,645,000, the largest sum paid in any of the fifteen years for which statistics have been collected, the amount for the first year ending 1868 being only £3,257,411,000. The extent of the commercial enterprise of London is strikingly indicated by the large number of companies, with their field of operations chiefly in foreign countries, which have been projected in the City or have in it their headquarters. The foreign operations of these companies are however sometimes only nominal, their real business being wholly confined to London itself.

Brewing. The largest manufacturing industry in London is that of brewing, the number of common brewers in 1880 being 110, who made use of 9,955,177 bushels of malt, while of the 412,192 barrels of beer exported from the United Kingdom 236,206 were from London. To supply the breweries with water, wells now require to be sunk below the chalk to the greensand. According to Stow, the brewers in 1585 in London and Westminster, who then remained "near to the friendly water of Thames," numbered 26, some of them being foreigners, who first introduced the art of cultivating hops. Among the oldest and most important of the breweries now existing is that of Barclay, Perkins & Co., which covers an area of 12 acres, belonged at one time to Johnson's friend Thrale, and occupies the site of the old Globe theatre.

Miscellaneous industries. Silk weaving, which received a special impulse from the settlement of foreign refugees at Spitalfields after the revocation of the edict of Nantes, has within the last fifty years been in a stagnant condition, owing chiefly to the rivalry of Lancashire. The majority of the other manufactures are carried on in the neighborhood of the Thames. The ships

built in London in 1881, which are principally yachts, numbered 64, but their total tonnage was only 2723. The principal shipbuilding yards are at the Isle of Dogs. Boat-building is extensively carried on at Chelsea and at several other places in the upper reaches of the river. There are large engineering-works at Lambeth and Millwall, potteries and glass-works at Lambeth, Whitefriars, and Southwark, tanneries at Bermondsey, chemical-works on the Lea, paper-works on the Wandle, and sugar bakeries at Whitechapel. The cabinetmakers' shops are situated principally in the neighborhood of Shoreditch, but there are several adjoining Tottenham Court Road and Hampstead Road, where upholstery warehouses are very numerous. Lucifer match making gives employment to a large number of women and children in the eastern districts. There are extensive hat manufactories in Lambeth. The special manufactures in different parts of London are too numerous for mention. The principal depôts of the carriage-builders are in Long Acre. A large trade in second-hand clothing is done by the Jews at Houndsditch, especially on Sunday morning, and on the same day of the week there are bird and fancy animal fairs at Church Street, Bethnal Green, and at St. Andrew's Street, Bloomsbury, near the Seven Dials. The centre of the wholesale book trade is in Paternoster Row, but some of the principal publishers have their premises in the neighborhood of Covent Garden and still farther west. Fleet Street is largely occupied with the offices of the London and the provincial daily newspapers, but the office of the *Times* is in Printing-house Square. The weekly newspapers have their offices chiefly in streets running off the Strand.

PAUPERISM.—London since 1867 has been divided into thirty poor-law unions, which are governed by boards of guardians, for the most part elected annually by the householders and owners of property, the number of votes possessed by each owner or householder varying from one to six, according to the value of the property. A proportion of the guardians in each union are so *ex officio*, or are nominated by the Local Government Board. The Act of 1867 authorized the establishment of outdoor dispensaries in any union or parish; and in twenty-seven of the thirty unions of the metropolis there are now forty-seven of these dispensaries, the number of prescriptions made up in the year 1880 being over a million. For the maintenance of lunatics and insane poor, of patients suffering from contagious diseases, and of pauper children at school, and for the relief of casual paupers, a metropolitan common poor fund is provided, through the operation of which the cost of maintaining the poor is now equalized, to the extent of 42·3 per cent. of the whole sum applied over the metropolitan area. The good results which have followed, both in lessening expense and diminishing

Poor-law unions.

TABLE XXII.

Parochial Year.	Total Relief to the Poor Adjusted.	Rate per £1 on Ratable Value.	In-Maintenance.	Outdoor Relief.	Ratio of Outdoor Relief to In.	Mean Number of Paupers.		Total.	Ratio per 1000 of Population.
						Indoor.	Outdoor.		
	£	s. d.	£	£					
1871	1,646,103	1 9¼	436,208	412,299	48·6 : 51·4	36,739	116,554	153,293	47
1880	1,817,972	1 5¾	513,775	198,422	27·9 : 72·1	48,251	50,665	98,916	27

pauperism, especially outdoor pauperism, form a strong argument for the complete equalization of the rates, and the creatiou of a united poor-law authority for the whole metropolis. The three unions which in 1880 contributed most in aid of the poorer ones were Kensington (£27,705), St. George's (£25,299), and the City of Loudon (£61,080); and the three unions most benefited were Holborn (£21,048), Bethnal Green (£19,835), and St. Saviour's, Southwark (£23,085); but, as will be seen from Table XXI. (p. 842), great inequality still exists in the rating, and the rate is generally higher iu the poorer districts. Each poor-law union possesses one or more workhouses, but the accommodation is inadequate, and difficulty in dealing satisfactorily with applicants often follows. Several unious, by the powers granted them under the Act of 1867, have combined into districts to provide infirmaries for the sick and imbecile, there being now only three unions—Bethnal Green, Hampstead, and Lewisham—whose sick are not treated in establishments under medical supervision. In addition to this, the several unions and parishes are combined into one metropolitan asylums district, with a managing body of sixty members, fifteen of whom are nominated by the Local Government Board. The total number of persons relieved in establishments belonging to the managers of the metropolitan asylums district since the first was opened in 1870 has been more than 1200 in imbecile asylums, nearly 50,000 in hospitals for infectious diseases, and 1375 on board the "Exmouth" training ship, which was established in March, 1876. The paupers' schools fall to be noticed under another section (see below, p. 844). The amount of accommodation provided in the various establishments of the unions in July, 1870, was 35,093 beds, and in December, 1880, it was 53,332 beds. Table XX. gives a summary of the poor rate returns for 1880; Table XXI. the ratable value of the different unions in 1871 and 1881, and the average pauperism, the amount of adjusted relief, and the rate in the ponnd for relief in 1880; and Table XXII. various particulars in reference to metropolitan pauperism for 1871 and 1880.

Charities. The annual income of the various charitable institutions in London is now over £4,000,000, of which at least three-fourths is spent in London. That of the endowed parochial charities of the City of London in 1865 was £64,500, which by 1881 had increased to £116,960, those of Westminster being in the same years £26,555 and £33,124. The income of the charities of the Livery Companies in 1869 was stated to be £99,027, and now the 1023 charities belonging to the companies have an aggregate income of £185,829, representing a capital value of £4,456,768. The amount spent on education is £65,130, and on doles £108,498. In addition, the charities of the corporation probably possess an annual income of £30,000. The parliamentary commission appointed to inquire into the endowed parochial charities of the City of Loudon and Westminster in the report of 1880 divides them into two classes,—those that are eleemosynary and those that are ecclesiastical. In regard to the first, it states that it is impossible to effect a satisfactory combination or readjustment of them under existing circumstances, and, in regard to the second, that they are so far liberated by altered circumstances as to require reappropriation to new charitable use.

Police. CRIME.—The London police district, or "Greater London," is divided into two police jurisdictions, that of the Metropolitau police, with an area of 440,919 acres, and that of the City police, with an area of 668 acres. The Metropolitan police force, which superseded the night watch in 1830, owes its existeuce to a bill iutroduced by Sir Robert Peel, providing for the establishment of a Metropolitan police nnder the control of the executive government. In 1839 the old watch was abolished within the City limits and a City police force appointed, which, however, is entirely under the control of the common council. There are two police courts within the City district, viz., Guildhall and Mansion House; aud thirteen within the Metropolitan district, viz., Bow Street, Clerkenwell, Great Marlborough Street, Marylebone, Westminster, Lambeth, Southwark, Thames (Stepney), Worship Street, Woolwich, Greenwich, Hammersmith, and Wandsworth. The headquarters of the Metropolitan police are at Scotland Yard. The expenses of the two City police courts in 1880 were £10,031, and those of the Metropolitan police courts were £59,009, of which £10,527 was defrayed by fines and forfeitures. The Metropolitan police have power to regulate the street traffic, to inspect aud license cabs, omnibuses, and other public conveyances, to interfere in abating smoke nuisance, and to inspect common lodging-houses. From 6158 in 1861 the Metropolitan force had in 1880 increased to 10,943, or one to every 430 of the population; the City police force from 628 to 830, or one to every 61 of the population. The increase of the City police force is necessitated wholly by the increase iu the number of persons who daily frequent the City, for not only has the night population greatly diminished, bnt the resident criminal popnlation has become almost extinct. The number of persons belonging to the criminal classes in the whole police district of the metropolis in 1880 was 2392, or one in 1992 of the population in 1881; the number of known thieves 1385, the nnmber in England being 17,907; the number of indictable offences was 17,835 (of which 1137 occurred in the City), the number in England being 52,427; and the number of apprehensions 5261 (City 612), the number in England being 22,231. Of indictable offences 49 were murders, 6 attempted murders, 443 attempted suicide, 1150 burglaries, 8918 simple larcenies, 1745 larcenies from the person, and 367 utterances of counterfeit coin; 47 bodies of persons fouud dead and unknown were photographed and not identified. The number of offences determined summarily within the area of the Metropolitan police district was 125,302, or 11·41 to every policeman, the proportion of indictable offences to every policeman being 6·70. The nnmber of offences determined summarily within the City area was 5649, or only 6·70 to every policeman, while the proportion of indictable offences was only ·78. The total expense of the Metropolitan police was £1,168,061, or about £106 per man; £451,334 was contributed to the expense from public revenue, and £93,071 was received for special services. The expense of the City police, £90,662 in 1880, is defrayed wholly by rate, and the cost per man is about £109.

The following table (XXIII.) gives details regarding police and crime in the Metropolitan police district since 1871, by which it will be seen that, although compared with the increase of popnlation the total number of apprehensions has diminished, there has of late years been a considerable increase in the number of felonies, and that the amount of property lost by felonies has been increasing very seriously:—

	Total Police Force.	Apprehensions and Convictions.			Felonies.					Persons Apprehended under Poor Law Acts.	Apprehensions for drink.	
		Persons Apprehended.	Convicted on Trial	Summarily Convicted.	Number of Felonies.	Apprehensions for Felony.	First Loss.	Amount Recovered.	Proportion per 1000 of Population.		Persons Apprehended.	Proportion per 1000 of Population.
1871	9,655	71,961	2,655	45,608	16,926	10,054	£77,328	£19,284	4·444	6,142	24,213	6·358

Prisons. The Newgate and Holloway prisons are in the hands of the Court of Aldermen. Newgate, rebuilt after the riots of 1780, is now no longer used for persons awaiting trial in the Central Court. The City prison, Holloway, which is the house of correction for City prisoners, was erected in 1851 at a cost of nearly £100,000. Bridewell, which occupied the site of a royal palace, and was granted to the city as a house of correction by Edward VI., was discontinued in 1864; the old Fleet prison was abolished in 1844, its site being now occupied by the Memorial Hall of the Congregationalists; Horsemonger Lane prison was superseded by Wandsworth prison; and the Marshalsea in Southwark, immortalized by Charles Dickens, had been discontinued long before he wrote. The house of detention for Middlesex is Clerkenwell, and its houses of correction are Coldbath Fields for male prisoners and Westminster for females. Wandsworth is the prison for Surrey. The convict prisons within the metropolitan area are Brixton, Millbank, Pentonville, Wormwood Scrubs, Woking, and Fulham.

Elementary schools. EDUCATION.—Until the constitution of a School Board for London in 1870, the only special organizations for providing education to the poorer classes in London were the British and Foreign School Society, founded in 1808, and the National Society, founded in 1811. Many of the parish schools became amalgamated with those of the National Society, but the united efforts of these societies, and also of the Church of England, of the different denominations, and of various promiscuous charitable institutions, failed so completely to meet the necessities of the rapidly increasing population, that in 1851 the total number of scholars attending public schools was only 167,298, and that in 1871 the returns of the voluntary schools showed that there was accommodation for only 262,259 children, or 39 per cent. of the estimated population of school age. By October, 1881, the School Board had supplied accommodation for 236,024 children, which with that in voluntary schools gives a total number of places sufficient for 502,095 children, in addition to which schools are in the process of erection for upwards of 100,000 more. Up to August, 1881, 6838 children were sent to industrial schools at the instance of the board, and the board now possesses three industrial schools under its own management. The total number of children attending workhouse, separate union, and parochial and district schools in 1880 was 35,223, the amount paid to teachers in these schools being £37,110. The total expenditure of the School Board for the year ending 25th March, 1881, was £1,236,360. The amount paid by rating authorities in 1881–82 was £676,579, the rate in the pound being 6·15d., a less rate than that for 1880–81, which was 6·28d., but in all probability there may for some years be a slight increase. The average cost of the 3129 teachers in 1880 was £123. The gross cost per child has risen from £2, 4s. 9d. in 1874 to £2, 17s. 1d. in 1881, but there will probably be a considerable diminution when the schools become all fully occupied throughout a whole year. The following table (XXIV.) gives a comparison of cost between the board schools and other schools of London and of England in 1880:—

	Income per Scholar.						Education Grant per Scholar.			Expenditure per Scholar.					
	School Fees.			Voluntary Contributions.						For Salary.			Total Cost.		
	£	s.	d.	£	s.	d.	£	s.	d.	£	s.	d.	£	s.	d.

Grammar schools. Fitzstephen mentions that in his time the three principal churches possessed by ancient privilege and dignity celebrated schools, and that other schools were permitted on sufferance. The churches referred to are supposed by Stow to have been St. Paul's Cathedral, St. Peter's at Westminster, and St. Saviour's, Bermondsey, in Southwark. The various other priories and religious houses which were afterwards founded had each its school, though of less fame than the earlier ones. On account of the suppression of the alien priories and religious houses by Henry V., Henry VI. in 1445 founded grammar schools at St. Martin's-le-Grand, St. Mary-le-Bow, St. Dunstan's in the West, and St. Anthony's, and in the following year others in St. Andrew's, Holborn, All Hallows the Great, St. Peter's, Cornhill, and in the hospital of St. Thomas of Acon. The custom of school disputations mentioned by Fitzstephen was continued till the time of Stow, who states that they were restrained on account of the quarrels between the boys of St. Paul's and St. Anthony's. In his time the principal schools "repairing to these exercises" were St. Paul's, St. Peter's (Westminster), St. Thomas of Acon, and St. Anthony's. The last-named, which commonly presented the best scholars, and at which Sir Thomas More, Lord Chancellor Heath, and Archbishop Whitgift received their education, had, however, latterly greatly decayed. Up to the time of the dissolution of the monasteries education in England had been in the hands of the religious houses, but, though many of the grammar schools in London were then discontinued, several were re-erected and re-endowed, and others were added in subsequent years. Of these schools there are now existing St. Paul's, St. Peter's (Westminster), Christ's Hospital (Blue Coat School), Merchant Taylors' School, Charterhouse, Mercers' School, and the City of London School.

St. Paul's School, St. Paul's Churchyard, was re-established in 1512 by Dean Colet, for the free education of one hundred and fifty-three poor children, and was endowed with lands whose original annual value was £122, 4s. 7½d., but which now yield nearly £6000 yearly. The board of governors consists of thirteen members chosen by the Mercers' Company and nine nominated by the universities. Vacancies on the foundation are filled up by competition, and the school fee for the scholars is £20. The course of study, which formerly was chiefly classical, is now specially designed to prepare for the army examinations. The site of the school will soon be changed to West Kensington, where grounds to the extent of 16 acres have been purchased.

St. Peter's School, Westminster, re-endowed by Queen Elizabeth in 1560, provides for 40 queen's scholars on the foundation; and the school is also attended by about 180 day pupils. Besides six junior exhibitions tenable at school, there are eight exhibitions to Oxford or Cambridge. The management of the school is regulated by the Public Schools Act of 1868. The school, which is in the Dean's Yard, was formerly the dormitory of the monks of the abbey.

Christ's Hospital (Blue Coat School), Newgate Street, founded by Edward VI. in 1533 on the site of the monastery of Greyfriars, has an annual income of over £60,000, and the number of children on the foundation is about 1180, including 440 at the preparatory school at Hertford, of whom 90 are girls. The school is under the management of a court of governors, to which any one may be admitted on payment of a donation of £500. The education is chiefly commercial, but four boys are annually sent to the universities. The boys still retain their ancient dress, as well as several peculiar privileges.

Merchant Taylors' School, which was formerly situated in Suffolk Lane, but in 1875 was removed to the Charterhouse, was founded by the Merchant Taylors' Company in 1561, and provides for the education of 500 boys annually on payment of 12 guineas in the lower school, and 15 guineas in the upper. The site of the present building was purchased for about £90,000, and the new school-house cost £30,000. The rooms of the pensioners of Charterhouse remain entire, as well as the chapel of the date 1512, the master's lodge, and the great chamber, the interior of which is a very fine specimen of Elizabethan work.

Charterhouse, formerly a Carthusian monastery and afterwards the seat of the Howards, was purchased by Sir Thomas Sutton, and in 1611 endowed as a school. On the foundation 80 pensioners are maintained at Charterhouse, and 60 scholars at the school at Godalming, where it was removed in 1872.

The Mercers' Grammar School, Collegiate Hill, Dowgate, was originally attached to the hospital of St. Thomas of Acon, which was sold in 1522 to the Mercers' Company on condition that they maintained the school. Of the 180 scholars 25 are free.

For the City of London School, founded by the City corporation in 1835, at Milk Street, Cheapside, to supply education to sons of respectable persons, a new building is in course of erection on the Thames embankment. There are preparatory schools in connection with University College and King's College.

Higher education. The University of London, Burlington Gardens, instituted in 1836, and removed in 1869 to its present building in the Italian Renaissance style, is a mere examining body for conferring degrees. University College, Gower Street, founded in 1828 on undenominational principles, supplies instruction in all the branches of education—including engineering and the fine arts—that are taught in universities, with the exception of theology, and is attended by over 1500 students. The buildings, the chief feature of which is the Corinthian

portico at the main entrance surmounted by a dome, were enlarged by a wing in 1881, and contain a large library, and the Flaxman gallery, with original models by Flaxman. King's College, erected by Smirke in 1828, and forming the east wing of Somerset House, provides similar instruction to University College, but with the addition of theology, and in connection with the Church of England. At Gresham College, founded in 1597 by Sir Thomas Gresham, and removed to its present building in Basinghall Street in 1843, lectures are given on law, divinity, the sciences, music, and medicine. The lectures of the London Society for the Extension of University Teaching have been instrumental in stimulating to some degree general interest in literary and scientific subjects, and in 1881 were attended by 3030 persons. The legal lectures in connection with the Inns of Court are noticed in the article INNS OF COURT, vol. xiii. p. 91 *sq.*

Medical schools.

SCIENCE.—The great medical schools owe their fame and success to the attraction which London presents to eminent physicians and surgeons, and to the existence of extensive medical and surgical hospitals, which afford unequalled opportunities for the study of disease. In addition to the university of London, the Royal College of Physicians, founded by Linacre, physician to Henry VII. and Henry VIII., is an examining body for diplomas in medicine; and the Royal College of Surgeons, which originated in the livery company of Barber-Surgeons, formed by the incorporation of the surgeons with the barbers in 1540, has similar authority in regard to the practice of surgery. The College of Physicians, originally located in the private house of Linacre in Knight-Rider Street, and afterwards in a building designed by Wren in Warwick Lane, removed to its present site in Trafalgar Square in 1825, where a Græco-Italian structure was erected from the designs of Smirke at a cost of £30,000. The College of Surgeons, Lincoln's Inn Fields, erected 1835–37 from the designs of Barry at a cost of £40,000, contains the Hunterian Museum, purchased by parliament in 1799 (see HUNTER, vol. xii. p. 405), an extensive library, and a lecture theatre. Until the time of John Hunter the medical and surgical education obtainable in London was of a very unsystematic character, and chiefly of a private nature, the provision made for dissection being often of the meagrest kind, while the lectures on anatomy and surgery were both included in a course of six weeks. Hunter's lectures, first delivered in 1774, had a very influential effect in the development of the medical and surgical schools connected with the hospitals, but their most rapid progress has been during the present century. A full description both of these hospitals and of the hospitals for special diseases will be found in the article

Other scientific schools.

ENGLAND, vol. viii. p. 229 *sq.*, and the article HOSPITAL, vol. xii. p. 314 *sq.* Among the other scientific schools of London may be mentioned the Royal School of Mines, Jermyn Street; the Normal School of Science, South Kensington; the Royal Veterinary College, Camden Town; the Royal Naval College, Greenwich; the Royal Naval School, New Cross; the Royal Military Academy, Woolwich; and the School of Practical Engineering at the Crystal Palace. The Guilds of London Institute for the advancement of technical education have lately founded colleges at Finsbury and South Kensington. The foundation stone of the South Kensington Institute was laid in 1882, and the building will be opened in 1884, the cost being £75,000, making a total with the Finsbury College of £102,000, in addition to £20,000 for fittings. The amount contributed by the Livery Companies to the undertaking is £23,000.

Scientific societies.

The most influential of the scientific societies is the Royal Society, incorporated by Charles II. in 1663. Originally located near Gresham College, Crane Court, it was removed in 1780 to Somerset House, and since 1857 it has occupied rooms in Burlington House, Piccadilly. In 1854 old Burlington House, built by Richard Boyle, earl of Burlington, was purchased by the Government for £140,000, and in 1872 a new building in the Renaissance style was erected for the various societies formerly accommodated in Somerset House, viz., the Chemical Society, the Geological Society (instituted 1807, incorporated 1826), the Society of Antiquaries (1707, 1751), the Royal Astronomical Society (1820, 1831), and the Linnean Society (1788, 1802). The Royal Geographical Society (1830, 1859), occupying a commodious building in Savile Row, has within the last forty years taken a leading part in promoting geographical discovery. The Royal Asiatic Society (1823) is in Albemarle Street. The Royal Institution of Great Britain, in the same street, established in 1799 chiefly for the promotion of research in connection with the experimental sciences, possesses a large library, a mineralogical museum, a chemical and a physical laboratory, and a foundation for a course of lectures. The Society of Arts, John Street, Adelphi, established in 1754 and incorporated in 1847, for the encouragement of arts, manufactures, and commerce, offers rewards for new inventions and discoveries, and grants certificates and prizes for proficiency in commercial knowledge, the industrial arts, musical theory, and domestic economy. Among other scientific societies the principal are the Statistical, the Meteorological, the Anthropological, the Entomological, the Numismatic, the Zoological, the Botanic, the Horticultural, the Institute of Civil Engineers, and the Royal Institute of British Architects. The Zoological Society, instituted in 1826, rented in 1828 a portion of Regent's Park, where they established gardens which now contain one of the finest collections of live specimens in the world. The gardens of the Botanic Society, which occupy 18 acres of Regent's Park, are not of a strictly scientific character, being used chiefly for musical promenades and flower shows, and are to be distinguished from the Government gardens at Kew, which are noticed under KEW (*q. v.*). The Horticultural Society, founded in 1804, possesses large fruit and flower gardens at Chiswick, and in 1861 entered upon a lease of 22 acres of ground, formerly occupied by the Exhibition of 1851, which they laid out at a cost of £50,000, and where they now hold their flower shows and fêtes.

Scientific museums.

Of museums, London possesses two on a scale of unexampled vastness, the British Museum and the South Kensington Museum. The zoological collection of the British Museum is still at Bloomsbury, but the departments of geology, mineralogy, and botany were removed in 1881 to a new building in Cromwell Road, South Kensington, called the British Museum of Natural History. The British Museum at Bloomsbury, and the South Kensington Museum, which are more directly connected with art than science, are noticed under the section Art. The Museum of Practical Geology, Jermyn Street, occupies a building in the Italian Palazzo style, erected in 1850 by Pennethorne at a cost of £30,000. It was founded in 1835 in connection with the geological survey of the United Kingdom, and also contains specially fine collections illustrative of the application of the minerals and metals to the useful arts. In the Patent Office Museum at South Kensington there are many of the original examples of the greatest mechanical inventions of modern times; and the United Service Museum, Whitehall, possesses relics and models illustrative both of the art of war and of the great naval and military achievements of England.

The drama.

DRAMA.—According to Fitzstephen, London, "instead of showes upon theatres and comical pastimes," possessed in his time "holy plays and representations of miracles;" and Stow mentions that in 1391 a play by the parish clerks continued three days together, and that another in the year 1409 lasted eight days, and was "of matter from the creation of the world." In the 15th century the secular began to supersede the sacred drama; its progress in London under Elizabeth and James I. will be touched on below (pp. 857 *sq.*). After the Restoration the "king's servants" who had previously occupied the Globe and Blackfriars played first at the Red Bull, then in Vere Street, Clare Market, and in 1663 removed to the Theatre Royal in Drury Lane. For Davenant's company, known as the "duke of York's," the Lincoln's Inn theatre was built on an improved plan in 1662, and there for the first time women actors were introduced. The two companies received each special patents in the same year. Before 1672, when Drury Lane theatre was burned, Davenant had removed to a new house built by Wren in Dorset Gardens, at a cost of £8000, and spoken of by Dryden as "like Nero's palace shining all with gold;" and, as the new Drury Lane was far less magnificent in its arrangements, it generally had the worst of the costly competition in which they engaged until the union of the patents in 1682. In 1695 a license was granted to a new theatre in Lincoln's Inn Fields, and in 1705 Haymarket theatre was opened, chiefly for Italian opera. The Dorset Gardens theatre was demolished in 1709. In 1733 the Lincoln's Inn theatre was removed to Covent Garden. The Act of 1737, which forbade the granting of new licenses, gave to the patent houses a monoply of the legitimate drama till 1843; but in the smaller houses, such as "The Little Haymarket" (erected in 1720), the Goodman's Fields theatre (1727), Sadler's Wells (1764), the Lyceum (1795), the Adelphi (about 1800), the Princess's (1830), the Strand (1831), and St. James's (built by Braham, 1835), the law was evaded by the performance of miscellaneous entertainments. The most striking feature in the dramatic entertainments of London is their variety; the old dramatic traditions of England, so closely associated with Drury Lane and Covent Garden, now exercise their influence

rather in Germany than in London. London at present possesses about thirty theatres, and the plays of the older dramatists are revived only occasionally, chiefly at Drury Lane, the Lyceum, and the Princess. Melodrama and the domestic drama win large support, but many theatres rely chiefly on comedy, farce, or opera-bouffe.

Musical performances.

MUSIC.—In 1673 the chequered career of English opera in London was first definitely commenced by the performance at Dorset Gardens of *Psyche*, followed by the *Tempest* and a little later *The Prophets* and *King Arthur*. For some time after the opening of the Haymarket theatre, Italian operas were varied by performances of English opera and the spoken drama, but the increasing success of the new entertainment soon led to its exclusive establishment. Since 1847 Italian opera has also been established at Covent Garden. English opera has lately been successfully revived by Carl Rosa, and Italian opera is also threatened with formidable rivalry by the performance on a scale of unexampled grandeur of Wagner's operas in German. The Academy of Ancient Concerts, established in 1710, had the honor in 1732 of introducing to the world that special development of Handel's genius, the oratorio, which still excites a wider and deeper interest in England than any other form of musical composition. The Ancient Concert Society did not find a worthy successor in its special sphere till the establishment of the Sacred Harmonic Society in 1821, which, besides its annual series of performances, formerly in Exeter Hall and latterly in St. James's Hall, has organized great triennial festivals at the Crystal Palace. Oratorio performances on a larger scale than those of the Sacred Harmonic are now given at the Royal Albert Hall, but the nature of the building renders them less successful artistically. The Philharmonic Society has since its commencement in 1813 held a leading position in the performance of great instrumental works, which previous to this had been commenced at subscription concerts conducted by private enterprise, but the orchestral performances at the Crystal Palace are of equal excellence, and of late years the Richter and Halle concerts have excited a larger amount of general interest. The Monday and Saturday popular concerts for chamber music have been the special means of introducing to London audiences instrumental performers of European fame. By the formation of Henry Leslie's choir in 1855, the standard of refinement and taste in unaccompanied part-singing has been improved throughout England, and besides reviving general interest in glees and madrigals, it has been the principal means of giving currency to the "modern part song." The choir, after the suspension of its performances since 1880, was revived in 1882; and there are also in London several local choirs which have attained nearly equal perfection in similar performances. The Bach Society devotes itself to the study and performance of the unaccompanied music of Bach and the older composers. The earliest renderings of the great classical compositions are associated with the Hanover Square rooms, converted into a club house some years ago, and in a less degree with Willis's rooms, built in 1765, which are now used almost solely for balls and public meetings. The only concert-room in London of a convenient size for important performances is St. James's Hall, Regent Street and Piccadilly; for since the purchase of Exeter Hall, associated with the "May meetings," by the Young Men's Christian Association, its use is prohibited even to the Sacred Harmonic Society, and the Royal Albert Hall is much too large for the proper realization of the finer effects either of choral, orchestral, or solo performances. This elliptical building in the Italian Renaissance style, erected from the designs of Captain Fowke, was completed in 1871 at a cost of £200,000, and has accommodation for an audience of about 9000 and an orchestra of 1000. The Crystal and Alexandra Palaces, though they present the additional attractions of fine grounds, of scientific and art exhibitions, and of various forms of out-door amusement, base their claims to support in a great measure on their theatrical and musical performances, and, besides the large central halls for promenades, possess separate concert-rooms. The Crystal Palace, Sydenham, which has a total length of 1608 feet, and a width at the nave of 312 feet, and at the central transepts of 384 feet, was designed by Sir Joseph Paxton, and constructed in 1854 chiefly of iron and glass, out of the materials of the Exhibition building of 1851, at a cost of £1,500,000, including the adornment of the grounds, 200 acres in extent. The Alexandra Palace, Muswell Hill, situated in grounds of 300 acres, was completed in 1875, after having been burned down in 1873. It is built of brick in the form of a parallelogram, covering about 7½ acres, and consists of a central hall 386 feet by 184, two courts on each side 260 feet in length, and a concert-room and theatre detached from the main building. Miscellaneous concerts and other entertainments are given at the Royal Aquarium, Westminster, which was opened in 1876 at a cost of about £200,000.

Concert rooms.

Musical instruction.

In London there are probably a larger number of eminent professors of the various branches of music than in any other city of the world, but almost no provision for public musical instruction has been made by the state. The Royal Academy of Music, instituted in 1822, and incorporated by royal charter in 1830, receives from Government only an annual grant of £500, and, though attended by over 400 students, chiefly professional, is hampered in its organization and plans by deficiency in funds. The Guildhall School of Music, in which instruction may be commenced at an earlier stage, was established by the corporation of the City in 1879, and is now attended by 1200 students. The National Training School at South Kensington, for which endowments for only five years were provided, is now discontinued, a proposal having been made to supersede it by a Royal College under the presidency of the Prince of Wales, and with endowments sufficient to afford free education to 50 pupils, as well as maintenance and education to 50 others. The Tonic Sol-Fa College, Plaistow, was incorporated in 1875 for the special purpose of training teachers of music for the elementary schools of the country, that method of instruction in music being now used in the majority of schools where systematic musical instruction is given.

Art galleries.

PAINTING, SCULPTURE, AND THE APPLIED ARTS.—The most influential and the oldest institution in London connected with painting and sculpture is the Royal Academy of Fine Arts, founded in 1768, which, besides its annual exhibition of art in its new buildings in Burlington Gardens, Burlington House, erected in 1868–69, in the Italian Renaissance style from the designs of Smirke, has also organized classes for art instruction. The Society of Painters in Water-Colors, established in 1804, the Society of British Artists, founded in 1822 and incorporated in 1847, and the Institute of Painters in Water-Colors, hold each an annual exhibition. The National Gallery of Paintings originated in the purchase by parliament in 1824 of the collection of J. J. Angerstein for £57,000. The present Grecian building by Wilkins in Trafalgar Square (1832–38) was enlarged in 1860 and 1869, and in 1876 a new wing was added by Barry at a cost of over £80,000. The collection has received many additions both by purchase and bequest, and besides many noble examples of the old masters, contains some of the finest pictures of the English school, including the magnificent Turner collection. The National Portrait Gallery, the nucleus of which was formed in 1858, was removed to Exhibition Road, South Kensington, in 1870. In the Grosvenor Gallery, New Bond Street, erected by Sir Coutts Lindsay in 1877, there are annual exhibitions of works of art, and occasionally other special exhibitions. Several of the mansions of the nobility contain art galleries, which are open to the public on certain conditions. The most famous of these are perhaps the Grosvenor Gallery in the residence of the duke of Westminster, and the Bridgewater Gallery in the residence of the earl of Ellesmere.

British Museum.

The British Museum, Bloomsbury, originated in the purchase by Government in 1753 of the collection and library of Sir Hans Sloane, and occupies the site of Montague House. For the reception of the Egyptian antiquities presented by George III. (1801), of the Townley marbles (1805), and of the Elgin marbles (1816), a new wing was added to the building in 1823, but after the presentation of the king's library by George IV. in the same year, it was resolved gradually to reconstruct the whole building, the first portion being finished in 1828, and the work (except the new reading-room) completed in 1852. The exterior of the building is plain, with the exception of the massive Ionic portico at the principal entrance. The contents of the museum are divided into departments, which are under the charge of a keeper and one or more assistant keepers. The departments still at Bloomsbury are those of Printed Books, Manuscripts, Oriental MSS., Zoology, Oriental Antiquities, Greek and Roman Antiquities, Coins and Medals, British and Mediæval Antiquities and Ethnography, and Prints and Drawings. The collection both as a whole and in several departments —especially Greek and Roman Antiquities and Engravings —is unequalled in the world, and in all the departments a very high degree of completeness has been attained. For the library and reading-room, see LIBRARIES, p. 514.

South Kensington Museum.

South Kensington Museum, which is under the direction of the Committee of Council on Education, was originated by the late Prince Consort in 1852. The present building, to

which the collection was removed from Marlborough House in 1857, is erected of red brick and terra cotta in the Italian Renaissance style, and, though still in process of construction and development, includes a fine range of apartments, the interior consisting of courts and corridors of graceful proportions, and decorated with various designs. It contains a collection of objects of ornamental art, both ancient and modern, as applied to manufactures, a national gallery of British art, in addition to the Foster and Dyce collections, and a fine collection of water-color paintings, an extensive art library, a collection of sculpture chiefly of the Renaissance period, reproductions of ancient sculptures and paintings, and collections of animal products employed in the arts, of substances used for food, and of materials used for building and construction. Some of the rooms are occupied chiefly by articles on loan. In connection with the institution there is a National Art Training School, as well as a School of Science and a School of Cookery. The Bethnal Green Museum, a branch of South Kensington Museum, opened in 1872, besides a permanent food collection, and a collection of animal products, is occupied with various collections on loan. The India Museum, which was removed in 1880 from the India Office to a building in Exhibition Road, South Kensington, and placed under the care of the South Kensington Museum directors, contains a magnificent collection of every variety of Indian art and manufacture. The Soane Museum, Lincoln's Inn Fields, bequeathed to the nation by Sir John Soane in 1837, contains an architectural library, various models of famous ancient buildings, antique sculptures, gems, vases, and bronzes, and several fine paintings. The Royal Architectural Museum, Westminster, founded in 1851, is intended specially to advance the art of architecture by examples of the works of various nations and times, and by courses of lectures, and drawing and modelling classes.

Other museums.

CLUBS. See CLUB, vol. vi. p. 40.

Churches.

ECCLESIASTICAL BUILDINGS.—Fitzstephen states that in his time there were in London and its suburbs thirteen larger conventual churches besides one hundred and twenty-six lesser parochial ones. Stow gives a list of churches existing when he wrote, mentioning those which he knew to be suppressed or united to others. He gives the names of 125 churches, including St. Paul's and Westminster Abbey; 89 of these were destroyed by the great fire, and only 45 were rebuilt.

Paul's.

St. Paul's cathedral occupies the site of a church founded in 610 by Ethelbert. After the destruction of the church by fire in 1087, a new edifice in the Norman style was commenced, which was forty years in building, and according to William of Malmesbury, "could contain the utmost conceivable multitude of worshippers." In 1240 a new Pointed Gothic choir was added, and the erection of a lofty tower begun. The work of renovation and adornment was continued until 1315, when the cathedral was declared complete. Its dimensions as given by Stow were as follows:—height of steeple 520 feet; total length of church 720 feet; breadth 130; and height of the body of the church 150 feet. In 1561 the spire was struck by lightning, and the roof of the church partly destroyed by the fire that ensued. From this time it remained in a dilapidated condition until the reign of Charles I.; and the work of restoration under the direction of Inigo Jones, who added to the west front a Corinthian portico, had not been completed when the building was destroyed by the great fire of 1666. St. Paul's cross, which stood at the north-east corner of the cathedral, was rebuilt by Bishop Kemp in the 15th century, but was removed in 1643, its place being now occupied by a fountain. At the cross great religious disputations were held and papal bulls promulgated, and in its pulpit sermons were preached before the court. The present St. Paul's, erected in 1675–97 from the designs of Sir Christopher Wren at a cost of £747,954, is built in the form of a Latin cross, the length being 500 feet, the breadth at the transepts 250 feet, and of the choir and nave 125 feet. The dome, which separates the two transepts and the nave and choir, rises to a height of 365 feet, or of 404 feet to the top of the cross by which it is surmounted, the height of the interior dome being 225 feet. The principal front to the west consists of a double portico of Corinthian pillars flanked by campanile towers 120 feet in height. The transepts are bounded by semicircular rows of Corinthian pillars. St. Paul's is remarkable chiefly for its massive simplicity and beautiful proportions. The interior is imposing from its vastness, but the designs of Wren for its decoration were never carried out. Some of the monuments of the old building are preserved in the crypt, where are also the tombs of Sir Joshua Reynolds, Dr. Samuel Johnson,[1] J. M. W. Turner, Lord Nelson, the duke of Wellington, and other distinguished men, especially admirals and generals.

Westminster Abbey.

Westminster Abbey, as the coronation church of the sovereigns of England from the time of Harold, and on account of its proximity to the seat of English government, has acquired a fame and importance which in a certain sense outvie those of St. Paul's. It occupies the sight of a chapel built by Sebert, in honor of St. Peter, on a slightly elevated spot rising from the marshy ground bordering the Thames. A church of greater pretensions was erected by King Edward about 980; but, this church being partly demolished by the Danes, Edward the Confessor founded within the precincts of his palace an abbey and church in the Norman style, which was completed in 1065, and of which there now only remain the pyx house to the south of the abbey, the substructure of the dormitory, and the south side of the cloisters. The rebuilding of the church was commenced by Henry III. in 1220, who erected the choir and transepts, and also a lady chapel, which was removed to make way for the chapel of Henry VII. The building was practically completed by Edward I., but the greater part of the nave in the Transition style, and various other improvements, were added down to the time of Henry VII., including the west end of the nave, the deanery, portions of the cloisters, and the Jerusalem chamber; while the two towers at the west end were erected by Wren, who had no proper appreciation of Gothic. The length of the church, including Henry VII.'s chapel, is 531 feet, or, excluding it, 416 feet, the breadth of the transepts 203 feet, the height of the church 102 feet, and of the towers 225 feet. The choir, where the coronation of English sovereigns takes place, is a fine specimen of Early English, with decorations added in the 14th century, and contains among other tombs those of Sebert, king of the East Saxons, Anne of Cleves, and Edmund Crouchback, earl of Leicester. The north transept is occupied principally with monuments of warriors and statesmen, and in the south transept the "poet's corner" contains memorials of most of the great English writers from Chaucer to Thackeray and Dickens. The nave, with its clustered columns, its beautiful triforium, and its lofty and finely proportioned roof, is the most impressive portion of the interior. The monuments in its north and south aisles are of a very miscellaneous character, and commemorate musicians, men of science, travellers, patriots, and adventurers. The monuments in the chapels of St. Benedict, St. Edmund, St. Nicholas, St. Paul, St. Erasmus, St. John the Baptist, and the Abbot Islip are chiefly to ecclesiastics and members of the nobility. Henry VII.'s chapel, which is remarkable for the fretted vault work of the roof, with its magical fan tracery, contains besides the monument of Henry VII. the tombs of many English sovereigns and their children, and also of various other personages of historic fame. In the chapel of Edward the Confessor are the shrine of Edward the Confessor in Purbeck marble, the altar tomb of Edward I., the coronation chairs of the English sovereigns, and the stone of Scone, the old coronation seat of the Scottish kings. In the chapter-house (1250) the meetings of the Commons took place before they were transferred to St. Stephen's Chapel; and in the Jerusalem chamber (1376–86),

[1] [Dr. Johnson's remains lie in Westminster Abbey. See Vol. XIII. p. 740. Reynolds's monument to his memory is at St. Paul's. See Vol. XX. p. 517.—AM. ED.]

where Edward V. is said to have been born and Henry IV. was brought to die, the sittings of the lower house of convocation of the province of Canterbury are now held.

Conventual churches of time of Fitz-stephen.

Among the conventual churches existing in the time of Fitz-stephen, there were destroyed by the fire three, those of St. Thomas of Acon, St. John the Baptist, and St. Martin-le-Grand, founded in 700. Of the other churches there still remain the choir, part of the nave, and portions of the transepts of the old church of St. Bartholomew the Great dating from the foundation of the monastery by Rahere, minstrel to Henry I., included in the present church, restored 1865–69, which also contains the tomb of its founder; a pointed pier of the old church of St. Catherine Cree, which was the conventual church of St. Austin's priory of the Holy Trinity, founded in 1108, but was rebuilt by Inigo Jones; the vaults and some of the old monuments of the old church of St. James's, Clerkenwell, built in connection with the Benedictine nunnery 1100, and replaced by the present structure 1788–92; the east wall and Norman crypt of the building which in the 15th century replaced the old church of the priory of St. John's of Jerusalem, Clerkenwell, founded in 1100, and of which the south gate in the Perpendicular style, built in 1504, still remains; and the Temple church, noticed in the article INNS OF COURT. Of the ancient church of St. Saviour's, Southwark, belonging to the priory of St. Mary Overy, a few seemingly Anglo-Saxon portions were incorporated in the building in the Early English style erected in the 13th century, which has been much disfigured by reconstructions and additions, although the beautiful choir, lady chapel, and transepts remain almost entire. The church of St. Katherine's Hospital was removed in 1825 to make way for St. Katherine's docks.

Other old churches.

Of the other churches which escaped the fire the principal are the Chapel Royal, Savoy, rebuilt by Henry VII. on the site of Savoy Palace in connection with the hospital of St. John the Baptist, from 1564 to 1717 used as the parish church of St. Mary-le-Strand, constituted a chapel royal in 1773, and restored in 1865 by Smirke after partial destruction by fire; All Hallows, Barking, founded in connection with the Benedictine convent of Barking, Essex, some time before Richard I., chiefly Perpendicular, and containing several brasses; St. Andrew's Undershaft (1520–32), in the Perpendicular style, with a turreted tower, and containing among other tombs that of Stow the chronicler; St. Giles's, Cripplegate, founded 1090, rebuilt in the Gothic style after destruction by fire in 1545 (with the exception of the fine tower, added in 1660), where Cromwell was married, and Milton and Foxe the martyrologist were buried; St. Helen's, Bishopsgate Street, founded in connection with a priory of nuns (1216), chiefly in the Third Pointed style, and containing many brasses and monuments of city dignitaries; St. Margaret's, Westminster, founded by Edward the Confessor, re-erected by Edward I., and frequently restored, containing a window originally executed by Gouda for Waltham Abbey, and possessing a large number of monuments to eminent persons; St. Olave's, Hart Street, in the Gothic style, belonging to the 15th century, but much altered by restoration, containing a large number of brasses and monuments; the small church of Trinity in the Minories, formerly connected with a convent founded by Blanche, wife of Edmund Plantagenet, second son of Henry III., containing in a state of complete preservation the head of the duke of Suffolk, father of Lady Jane Grey.

Wren's churches.

That the only important external feature of Wren's churches is the tower or steeple is a peculiarity to be explained by the fact that the merit of his style consisted more in beauty of general outline than in elaboration of details, that from the amount of money placed at his disposal he was generally compelled to concentrate his chief attention on a special part of the building, and that on account of the crowding of surrounding buildings the steeple was often the only part of the church that could be made effective. His interiors, however, are finely proportioned. Among his more important churches are St. Bride's, Fleet Street, which possesses one of his finest steeples, and contains the grave of Richardson the novelist; St. Dunstan's-in-the-East, of which the only portion by Wren now remaining is the steeple, resting on quadrangular columns with a mural crown copied from St. Nicholas's, Newcastle; St. James's, Piccadilly, only remarkable for its elaborate interior and a white marble font by Gibbons; St. Lawrence, Jewry; St. Mary-le-Bow, containing the Norman crypt of the old building, which was the first church in the city built on arches (hence the name), and adorned with one of the finest of Wren's steeples, in which are the proverbial "Bow Bells;" St. Michael's, Cornhill, with perpendicular tower imitated from that of Magdalen College, Oxford; St. Mary, Aldermary, rebuilt by Wren on the Gothic model of the old church; St. Stephen's, Walbrook, with an interior similar to St. Paul's; St. Swithin's, Cannon Street, in a wall of which the famous "London Stone" is built; and St. Clement Danes, in which Dr. Samuel Johnson was accustomed to worship.

Later churches.

Of the churches of the period succeeding that of Wren, the most notable are St. George's, Hanover Square (1724), by James, with Classic portico and tower, and three painted windows of the 16th century made at Mechlin; St. Giles-in-the-Fields (1734), by Flitcroft, with tapering spire, and containing the graves of Flaxman the sculptor and Andrew Marvel; St. Martin-in-the-Fields (1726), by Gibbs, with a fine Corinthian portico, behind which the spire is awkwardly placed; St. Mary-le-Strand (1717), by Gibbs, occupying the site of the old Maypole; St. Mary-le-Bone (1817), by Hardwicke, in the Classic style, containing altarpiece presented by Wren to the old church; St. Pancras (1822), with a steeple in imitation of the Temple of the Winds, and a very elaborate interior copied from the Erechtheum at Athens; St. Paul's, Covent Garden, originally designed by Inigo Jones, and restored after a fire in 1795. The more modern churches are chiefly in the Gothic style.

Other churches and chapels.

Of the religious buildings connected with the numerous denominations and nationalities, few possess exceptional interest either of an antiquarian or architectural character. St. George's Cathedral, Southwark (1848), designed by Pugin, is said to be the largest Roman Catholic building erected in England since the Reformation; and Ely Chapel, Holborn, the only remaining relic of the palace of the bishops of Ely, has lately been purchased and restored by the Roman Catholics. Among the chapels belonging to the Protestant dissenters the best known are perhaps Mr. Spurgeon's Tabernacle, the City Temple, and Christ Church, Newington. The Dutch Church in Austinfriars was presented by Edward VI. to Dutch residents in London in 1550; the nave is in the Decorated style of the 13th century.

Lambeth Palace.

Lambeth Palace, situated near one of the old hithes or landing-places of the Thames, came into the possession of the archbishops of Canterbury in 1197. The oldest portion of the present building, including the chapel in the Early English style, was erected by Archbishop Boniface (1244–70), but the Lollards' Tower, in which the Lollards were tortured and the earl of Essex was imprisoned, was built in 1434, and the great hall with an elaborate timber roof in 1663. The inhabited portion was erected 1828–48 from the designs of Blore. The adjoining church of St. Mary, the oldest part of which dates from the 14th century, contains the tombs of several archbishops, as does also the palace chapel. The library is noticed in LIBRARIES, p. 515.

ROYAL PALACES AND GOVERNMENT BUILDINGS.—Stow mentions that in his time there was a large building called the Old Wardrobe in the Old Jewry, very ancient, but of which all that he knew was that it had been alluded to by Henry VI. as his principal palace in the Old Jewry. The palace of Westminster existed at least as early as the reign of Canute, but the building spoken of by Fitz-stephen as an "incomparable structure furnished with a breastwork and a bastion" is supposed to have been founded by Edward the Confessor, who built what was afterwards known as the Painted Chamber, and also the apartment afterwards used by the House of Lords. The palace was probably enlarged by William the Conqueror, and William Rufus built the great hall in 1097. The palace suffered severely from fire in 1263 and 1299, and after the great fire of 1512 it was no longer used as a royal residence, and was allowed for a time to fall into decay, with the exception of the great hall. Subsequently it was fitted up and made use of for the meetings of parliament until 1835, when again the whole, with the exception of the great hall, fell a prey to the flames. The apartment in which the House of Commons met was the beautiful St. Stephen's chapel, originally built by Stephen. Westminster Hall, which is 290 feet long, 68 feet wide, and 90 feet in height, with a carved timber roof remarkable for its beauty and the ingenuity of its construction, is used as the vestibule of the law courts and the Houses of Parliament. Ac-

Palace of Westminster.

cording to Stow the "princes" after the destruction of Westminster Palace "lodged in other places about the city, as at Baynarde's castle (which was destroyed in the great fire), at Bridewell, and Whitehall, sometimes called York Place, and sometimes at St. James's." It was at Bridewell, which occupies the site of an old Norman tower, and was for a long time the occasional residence of the kings of England, that Henry VIII., who, according to Stow, built there "a stately and beautiful house of new," was staying, on account of the destruction of Westminster Palace, when the interview took place in 1528 between him and his nobles, commemorated in the third act of Shakespeare's *Henry VIII.* After the fall of Wolsey, York House, which from 1248 had been the residence of the archbishops of York, came into the possession of the crown, and obtained the name of Whitehall. The palace was almost reconstructed by Henry VIII., who made it his principal residence, and employed Holbein in its decoration; but a new banqueting hall, erected by James I. in place of the old one burned down in 1615, was the only portion of the building which escaped the destruction caused by fire in 1691 and 1697. This hall, converted into a royal chapel by George I., is a fine specimen of Palladian architecture, and its ceiling is adorned with allegorical paintings by Rubens. Through the banqueting hall Charles I. passed on his way to execution beneath its windows, and Cromwell breathed his last within an apartment of the palace.

Whitehall.

St. James's Palace. St. James's Palace, which after the destruction of Whitehall continued to be the principal royal residence until it was nearly all destroyed by fire in 1809, with the exception of the old gateway, the chapel adjoining, and the presence chamber, was built by Henry VIII. for a country residence instead of Kennington, on the site of an old hospital for lepers founded in the 12th century.

Buckingham Palace. Buckingham Palace, the town residence of Queen Victoria, occupies the site of Buckingham House, purchased by George III. in 1761. The present building in the Classic style was erected 1825–35 by Nash, a west wing with a dull façade 460 feet in length, facing St. James's Park, being added in 1846, and a large ball-room in 1856. The picture gallery contains a specially fine collection of pictures by the great Dutch masters.

Kensington Palace, a favorite residence of several English sovereigns, is noticed under KENSINGTON. Marlborough House, built by the first duke of Marlborough in 1710 from the designs of Wren, came into the possession of the crown in 1817, and has been occupied by the Prince of Wales since 1863.

The Tower. The Tower of London, to the east of the city on the left bank of the Thames, called by Fitzstephen the Palatine Tower, was, according to tradition, originally built by Julius Cæsar, but the nucleus of the present building was begun in 1078 by William the Conqueror, who erected the part now known as the White Tower to take the place of a portion of the walls and towers of the city which had been washed away by the Thames. This tower was completed in 1098 by William Rufus, who also began the St. Thomas Tower and the Traitor's Gate. Additions were made at various periods, especially by Henry III., who used it frequently as a residence; and it now occupies an area of 13 acres surrounded by a moat, constructed in 1190, enclosing a double line of fortifications, behind which is a ring of buildings consisting of various towers, and the barracks and military stores, while in the centre is the massive quadrangular White Tower, with Norman arches and windows, and adorned with a turret at each corner. The St. John's chapel in this tower is one of the finest and most complete specimens of Norman architecture in England. The Tower of London has an extensive collection of armor, and is the repository for the regalia of England. The execution of the long list of important political prisoners confined in the Tower took place on the neighboring Tower Hill, and most of them were buried in the chapel of St. Peter Ad Vincula.

Houses of Parliament. The new palace of Westminster (1840–67), built at a cost of about £3,000,000 from the designs of Barry, for the Houses of Parliament, on the site of the old palace destroyed by fire in 1835, is a vast and ornate building in the Tudor-Gothic style, covering altogether an area of about 8 acres. Towards the river it presents a very richly adorned and effective façade. At the north-east corner is the clock-tower, 320 feet in height, resembling the clock-tower at Bruges; above the dome over the central hall a spire rises to the height of 300 feet; and the Victoria tower, 340 feet, surmounts the royal entrance at the south-west corner. The central hall, which is entered by St. Stephen's Porch and St. Stephen's Hall, built above St. Stephen's Crypt, a portion of the old building, separates the House of Peers, which, along with the royal rooms, occupies the western portion of the building, from the House of Commons, to which the eastern portion is assigned.

Government offices. The Government offices, situated in Whitehall and Downing Street, form several miscellaneous groups erected at different periods and in very various styles of architecture. The Treasury, Whitehall (1737), containing the official residence of the premier, the Education Office, the Privy Council Office, and the Board of Trade, was improved in 1847 by the construction of a new façade designed by Barry. The Horse Guards, the headquarters of the commander-in-chief, an insignificant building with a central clock-turret, was erected in 1753 on the site of a guard-house built in 1631 for the security of Whitehall. The Admiralty, a plain structure with a Grecian façade, was erected in 1726. The new Public Offices, a fine range of buildings in the Italian style, erected from the designs of Sir Gilbert Scott at a cost of over £500,000, contain the Home, Foreign, Colonial, and Indian Offices, and various other departments. Somerset House, Strand (1776–86), a large quadrangular structure, the finest façade of which is that towards the river, occupies the site of a palace founded by Protector Somerset in 1547. It contains the Exchequer and Audit Office, the Inland Revenue Office, the Office of the Registrar-General, the Admiralty, Register, and the Prerogative Will Office, removed from Doctor's Commons in 1874. The other Government offices at present occupy unpretentious buildings in various streets, chiefly in the neighborhood of Whitehall and Westminster. Heralds' College (College of Arms), the authority in regard to pedigrees and armorial bearings, is located in Queen Victoria Street, in a building re-erected in 1683 from the designs of Wren. The General Post-Office, St. Martin's-le-Grand, City (1825–29), designed by Smirke in the Grecian style, and occupying the site of St. Martin's church and abbey, will probably soon be removed farther westwards. The General Telegraph Office, opposite the Post-Office, was erected 1870–73 at a cost of £450,000. The new Record Office in the Tudor style (1851–56) is situated in Fetter Lane.

Law courts. The law courts, which are described in the article ENGLAND, vol. viii. p. 236, and were accommodated in Lincoln's Inn and in buildings adjoining Westminster Hall, where they were first established in 1224, will soon be all removed to the New Law Courts in the Strand, designed by Street, and estimated to cost about £500,000.

Monuments. MEMORIALS AND STATUES.—The principal monuments are The Monument (1671–77), a fluted Doric column designed by Wren, and erected in commemoration of the great fire, at a cost £13,700; the Nelson Column, Trafalgar Square, by Railton, erected (1843) at a cost of £46,000, a copy in granite from the Temple of Mars Ultor, 145 feet in height, crowned with a statue of Nelson by Barry, and having at its base four colossal bronze lions modelled by Sir Edwin Landseer; the Duke of York Column, Carlton House Terrace (1833), an Ionic pillar 124 feet, designed by Wyatt, surmounted by a bronze statue by Westmacott; Westminster Column, erected to the memory of the old pupils of Westminster school who died in the Russian and Indian wars of 1854–59; the Guards Memorial, Waterloo Place, erected in honor of the foot guards who died in the Crimea; the Albert Memorial, Hyde Park, a highly decorated Gothic structure adorned with numerous rilievos and statues, erected from the designs of Sir Gilbert Scott at a cost of £120,000; Cleopatra's Needle, presented to the Government by Mehemet Ali in 1819, brought from Alexandria in 1878, and erected on the Thames embankment on a pedestal of gray granite. Temple Bar, erected by Sir Christopher Wren (1670–72), was removed in 1877, but its site is at present occupied by an erection surmounted by a griffin.

Statues. The following is a list of the principal public statues:—

Name.	Site.	Sculptor.
Achilles.	Hyde Park.	Westmacott.
Anne, Queen.	St. Paul's Churchyard.	Bird.
Beaconsfield, Earl of.	Parliament Square.	Raggi.
Bedford, John, Duke of.	Russell Square.	Westmacott.
Bentinck, Lord George.	Cavendish Square.	Campbell.
Burgoyne.	Waterloo Place.	Boehm.
Canning, George.	New Palace Yard.	Westmacott.
Charles I.	Charing Cross.	Le Sœur.
Charles II.	Chelsea Hospital.	Gibbons.
Clyde, Lord.	Waterloo Place.	Marochetti.
Cobden.	Hampstead Road.	Wills.
Cumberland, Duke of.	Cavendish Square.	Chew.
Derby, Earl of.	Parliament Square.	Noble.
Fox, Charles James.	Bloomsbury Square.	Westmacott.
Franklin, Sir John.	Waterloo Place.	Noble.
George III.	Somerset House.	Bacon.
Do.	Cockspur Street.	M. C. Wyatt.
George IV.	Trafalgar Square.	Chantrey.
Havelock.	Trafalgar Square.	Behnes.
Herbert, Lord.	Pall Mall.	Foley.
Hill, Rowland.	Royal Exchange.	O. Ford.
James II.	Whitehall.	Gibbons.
Jenner.	Kensington Gardens.	Marshall.
Kent, Duke of.	Portland Place.	Gahagan.
Mill, J. S.	Victoria Embankment.	Woolner.
Napier, Sir Charles.	Trafalgar Square.	Adams.
Outram, Sir J.	Victoria Embankment.	Noble.
Palmerston, Lord.	Palace Yard.	Woolner.
Peabody, George.	Royal Exchange.	Story.
Peel, Sir Robert.	Cheapside.	Behnes.
Pitt, William.	Hanover Square.	Chantrey.
Prince Consort.	Holborn Viaduct.	Bacon.
Richard I.	Old Palace Yard.	Marochetti.
Sloane, Sir H.	Chelsea.	Rysbraek.
Victoria.	Royal Exchange.	Lough.
Wellington, Duke of.	Green Park Arch.	Wyatt.
Do.	Tower Green.	Milnes.
Do.	Royal Exchange,	Chantrey.
William III.	St. James's Square.	Bacon.
William IV.	King William Street.	Nixon.

(T. F. H.)

History.

British and Roman (to 449 A. D.).—Bishop Stillingfleet, writing of London, stated that after the fullest inquiry he was inclined "to believe it of a Roman foundation, and no older than the time of Claudius" (*Origines Brit.*, 1685, p. 43); and several antiquaries and historians hold the same opinion.[1] Although Geoffrey of Monmouth's vision of a great British city of Troynovant, founded by Brut, a descendant of Æneas, must be relegated to the limbo of myths, we need not necessarily dispute the existence of a British London. There can be little doubt that the name of London has a Celtic origin, and therefore there is probably a grain of truth in Geoffrey's fanciful description. The place was probably very small, but it must have been chosen for its commanding position on the banks of a fine river, and there may be some truth in the assertion that one Belinus formed a port or haven on the site of the present Billingsgate, although it does not follow that "he also made a gate of wonderful structure," or "over it built a prodigiously large tower" (*Historia*, lib. iii. cap. x.). What a British town was like we learn from Julius Cæsar, who tells us that it "was nothing more than a thick wood, fortified with a ditch and rampart, to serve as a place of retreat against the incursions of their enemies" (*De Bello Gallico*, v. 21). We may therefore imagine a clearing out of the great forest of Middlesex, extending probably from the site of St. Paul's Cathedral to that of the Bank of England, with the dwellings of the Britons spread about the higher ground looking down upon the Thames. The late Mr. Thomas Lewin believed that London had attained its prosperity before the Romans came, and held that it was probably the capital of Cassivellaunus, which was taken and sacked by Julius Cæsar. Not satisfied with affirming the existence of a British London, he went further, and indicated its extent. On the hill situated between the river Flete on the west and the Walbrook on the east was seated the British town. The western gate was Ludgate and the eastern Dowgate, and much of Mr. Lewin's argument rests upon the fact that these two names are of British origin (*Archæologia*, vol. xl. p. 59). The origin of London will probably always remain a subject of dispute, for want of decisive facts. A negative fact is that few if any remains of an earlier date than the Roman occupation have been discovered;[2] but, on the other hand, London could scarcely have come to be the important commercial centre described by Tacitus if it had only been founded a few years previously, and after the conquest of Claudius. Now there can be no doubt that the Britons made considerable progress during the period between Julius and Claudius, and it seems upon the whole highly probable that London as a British settlement may have come into existence then. There is some reason to believe that there were two settlements, one on the north and the other on the south bank of the Thames. If so they would be within the territories of distinct and possibly hostile tribes. There might be a ferry, and even, as we shall mention presently, a bridge of some description towards the close of the period, but this point will come before us again.

The Roman occupation of Britain extended over a period equal to that which has elapsed since Henry VIII.'s reign. During these centuries (43–409 A. D.) there was ample time for cities to grow up from small beginnings, to overflow their borders, and to be more than once rebuilt. The earliest Roman London must have been a comparatively small place, but it probably contained a military fort intended to cover the passage of the river. The mouth of the Thames was then only a few miles off, large portions of what are now the counties of Kent and Essex being marshes overflowed with water. The original investigations of Sir Christopher Wren led him to take this view, and he expressed the opinion that "the whole country between Camberwell Hill and the hills of Essex might have been a great frith or sinus of the sea, and much wider near the mouth of the Thames, which made a large plain of sand at low water, through which the river found its way. This mighty broad sand (now good meadow) was restrained by large banks still remaining, and reducing the river into its channel; a great work, of which no history gives account; the Britons were too rude to attempt it, the Saxons too much busied with continual wars; he concluded therefore it was Roman work" (Wren's *Parentalia*, p. 285). The opinion that these embankments are Roman work is the one generally held, but so greatly does opinion vary on all these points that some have supposed that they were not built until the reign of Henry VI.[3] Neither Strabo nor the elder Pliny alludes to London, although they wrote on Britain, and the name does not occur in literature until used by Tacitus. That author distinctly says that London had not in 61 A. D. been dignified with the name of a colony (*Annal.*, xiv. 33). The Roman general Paullinus Suetonius, after marching rapidly from Wales to put down a serious insurrection, found Londinium unfitted for a basis of operations, and therefore left the place to the mercy of Boadicea, who entirely destroyed it and killed the inhabitants in large numbers. When Tacitus wrote, Verulamium and Camulodunum possessed mints, but Londinium was not so distinguished. Subsequently, however, it became a place of mintage. When the British power was finally destroyed London again grew into importance, and we find it holding an important position in the Itinerary of Antoninus, Londinium being either a starting-point or a terminus in nearly half the routes described in the portion devoted to Britain. Ptolemy mentions Londinium, but places it on the south side of the Thames; this may merely be a mistake on Ptolemy's part, but it seems more probable that he referred more particularly to Southwark, which, as has been already pointed out, may have had a distinct origin from the Londinium of the north bank of the river.

[1] Dr. Guest affirmed that the notion of a British town having "preceded the Roman camp has no foundation to rest upon, and is inconsistent with all we know of the early geography of this part of Britain" (*Archæological Journal*, vol. xxiii. p. 180); and Mr. J. R. Green in his lately published work, *The Making of England*, expresses the same opinion (p. 101). This was not, however, Mr. Kemble's belief, for he held that it was difficult to believe that Cair Lunden was an unimportant place even in Cæsar's day (*Saxons in England*. vol. ii. p. 266).

[2] General Pitt Rivers (then Colonel Lane Fox) discovered in 1867 certain piles in excavations near London Wall and Southwark Street, possibly the remains of pile buildings, which he made the subject of a paper read before the Anthropological Society of London (*Journal*, vol. v. pp. lxxi.-lxxx.). These piles averaged 6 to 8 inches square, others of a smaller size were 4 inches by 3 inches, and one or two were as much as a foot square. They were found in the peat just above the virgin gravel, and with them were found the refuse of kitchen middens, broken pottery, etc., of the Roman period, but there was no superstructure. There is not much here upon which to found a theory, but nevertheless the fact is a valuable item of evidence in a very complicated question. If, as seems certain, these piles are remains of pile dwellings, there is every reason to believe that they were sunk by the Britons rather than by the Romans, and General Rivers thinks it probable that they are the remains of the British capital of Cassivellaunus, situated in the marshes, and of necessity built on piles.

[3] Sir George Airy holds that the embankment of the lower reaches of the Thames could not have been undertaken until after the construction of Old London Bridge, as when that was built the tide must have been small (*Proc. Inst. Civ. Eng.*, vol. xlix. p. 120). It is evident that, when the tidal water covered half a mile on both banks of the Thames for a distance of 30 miles, the river proper must have been considerably shallower than at present. Mr. J. B. Redman calculated that the quantity of water shut out by the embankments equalled from five-eighths to three-fourths of the present tidal column (*Proc. Inst. Civ. Eng.*, vol. xlix., p. 67).

Londinium was plundered in the reign of Diocletian and Maximian by the army of the usurper Allectus, but before the Franks who chiefly formed this army could fly Constantius sailed up the Thames and disembarked under the walls of the city, thus taking them by surprise. Under Julian London was the headquarters of Lupicinus in his campaign against the Scots and Picts; and in the reign of Valentinian, Ammianus tells us, Theodosius came to London from Boulogne to mature his plan for the restoration of the tranquillity of the province. It is on this occasion that Ammianus speaks twice of Loudinium as an ancient town, to which the title of Augusta had been accorded. By the anonymous chorographer of Ravenna it is called Londinium Augusta. As Theodosius is said to have left Britain in a sound and secure condition, with its dilapidated places restored, it has been supposed that to him was due the wall of the later Loudinium. According to old tradition, however, Constantine the Great walled the city at the request of his mother Helena, who was said to be a native of Britain. In spite of these various references we should know very little of Roman London if it had not been that a large number of excavations have been made in different parts of the city, which have disclosed a considerable amount of early history.[1] These go to prove that the early city occupied a somewhat small area, for it has been discovered that the site of the Royal Exchange was originally a gravel-pit, and had then become a dirty pond outside the walls used as a receptacle for refuse. Cemeteries also once existed in Cheapside, on the site of St. Paul's, close to Newgate, and various other places known to have been included in the later Roman London. As it was illegal in Roman times to bury within the walls, these places must at one time have been extramural. Among the large number of important sepulchral remains lately found by Mr. Taylor in Newgate Street were several *ossuaria*, or leaden vessels for the reception of the calcined bones of the dead. Little attention had been paid to these objects until Mr. Roach Smith specially alluded to them in an article on "Roman Sepulchral Remains discovered near the Minories, London" (*Collectanea Antiqua*, iii. 45–62). Subsequently Mr. Smith wrote a very elaborate article on "Roman Leaden Coffins and Ossuaria" (*Ibid.*, vii. 170–201), in which he refers to the wealth of the British mines as one of the chief incentives to the conquest of the country by the Romans, and points out that the large use of the costly metal, lead, "manufactured with such skill and so profusely as to supply not only the inhabitants of the towns, but those of villages and villas, with one of the daily requisites of advanced civilization," proves the prosperity and even luxury of the province. When Sir Christopher Wren was making excavations for his building of Bow Church he sunk about 18 feet deep through made ground, when he came upon "a Roman causeway of rough stone, close and well-rammed, with Roman brick and rubbish at the bottom for a foundation, and all firmly cemented." In consequence of this discovery the great architect came to the conclusion, which was corroborated by other reasons, that the causeway he had found continued for the whole length of the town, and formed the northern boundary—"the breadth then north and south was from the causeway now Cheapside to the river Thames, the extent east and west from Tower Hill to Ludgate, and the principal middle street or Prætorian Way was Watling Street" (*Parentalia*, p. 265).

Although it is generally agreed that this early Roman city was comparatively small, and in form an oblong square (a Londinium quadratum), its exact situation must be a matter of conjecture. The late Mr. Arthur Taylor marked out a district which should be bounded on the west by the Walbrook, on the east by Billingsgate, and on the south by the elevation of the bank of the Thames,—the northern boundary to be a line drawn below Lombard Street and Cornhill. Cannon Street and East Cheap would pass straight through the centre of this enclosure, with the other streets north and south (*Archæologia*, xxxiii. 101). In corroboration of his views, Mr. Taylor lays stress on the fact that no funeral urns have been discovered in the district he has marked out. Mr. Roach Smith agrees generally with Mr. Taylor, but includes a rather larger area. He writes,—"I should be inclined to place the northern wall somewhere along the course of Cornhill and Leadenhall Street; the eastern, in the direction of Billiter Street and Mark Lane; the southern, in the line of Upper and Lower Thames Street; and the western, on the eastern side of Walbrook. This suggested plan will give the form of an irregular square, in about the centre of each side of which may be placed the four main gates corresponding with Bridge Gate, Ludgate, Bishopsgate, and Aldgate" (*Illust. of Roman London*, p. 14). The late Mr. W. H. Black, like his predecessors, takes the Walbrook as a boundary, but, instead of making it the western limit, he makes it the eastern boundary, and places his western line at Ludgate. Newgate Street and Cheapside form the main thoroughfare of his city (*Archæologia*, xl. 41). Although Mr. Black argues his case with ability, his view is open to two principal objections,—(1) it leaves the site of London Bridge outside the enclosure, and (2) cemeteries have been discovered within the proposed limits. As to the date when the limits of this early London were lost sight of in the larger area of the better known Roman city, we have hardly sufficient data even to hazard a conjecture. There is reason to believe, as already stated, that the site of the Royal Exchange was outside the city until the early part of the 3d century, because coins of Vespasian, Domitian, and Severus have been found among the refuse of the gravel-pit. Mr. Roach Smith suggests, however, that as no coins of the period between Domitian and Severus were found it is just possible that the plated denarius of the latter emperor may not have been found in the pit itself, but in the vicinity of the houses which were built over the pit in subsequent years. On the other hand, Sir William Tite, in describing the tesselated pavement found in 1854 on the site of the Excise Office (Bishopsgate Street), expresses the opinion that the finished character of the pavement points to a period of security and wealth, and fixes on the reign of Hadrian (117–138 A. D.), to which the silver coin found on the floor belongs, as the date of its foundation. Of course this is not conclusive, as the pavement might have belonged to a villa outside the walls, but Sir William Tite places it within them. When the line of the walls which continued until the great fire was first planned out it is impossible to say with any certainty. Some antiquaries hold the opinion that these walls were post-Roman; but this is not the view of Mr. Roach Smith, one of our greatest authorities. Mr. J. E. Price, after describing "a bastion of London wall" discovered in Camomile Street, Bishopsgate, arrives at "the conclusion that these interesting relics are portions of a Roman sepulchral monument which, falling into decay, became, as years rolled on, a suitable quarry for mediæval builders, providing from its position on the spot convenient materials for the erection of a structure requiring such solidity and strength as would a bastion to the city wall." In describing the outline of the Roman city it is impossible to make ourselves intelligible unless we use names adopted subsequently. The line of the wall runs straight from the Tower to Aldgate, where it bends round somewhat to Bishopsgate. It is bordered on the east by the Minories and Houndsditch. One of the finest remaining portions of the old wall was hidden from view a few years ago when some large buildings were erected round it. The line from Bishopsgate ran eastward to St. Giles's churchyard, where it turned to the south, as far as Falcon Square, again westerly by Aldersgate under Christ's Hospital towards Giltspur Street, then south by Ludgate, and then down to the Thames. Mr. Roach Smith points out that this enclosure gives dimensions far greater than those of any other Roman town in Britain. In 1843 a portion of the old wall was exposed to view in Playhouse Yard, Blackfriars, when a Roman monument erected to a "speculator" of the second legion, named Celsus, was discovered. On the same line further north Sir Christopher Wren, while building St. Martin's, Ludgate, found a similar sepulchral monument "in the vallum of the prætorian camp" to the memory of Vivianus Marcianus, a soldier of the second legion (*Parentalia*, p. 266). In the year 1276 the old wall south of Ludgate was pulled down and a new one built to enclose a larger circuit further west for the benefit of the Black Friars. There appear to be strong reasons for believing that a wall ran along the south, and that the Romans did not consider the river sufficient protection. William Fitzstephen, a monk of the 12th century, who wrote the earliest description of London, mentions the walls and tower in the south, and Sir Christopher Wren also alludes to the colony being walled next the Thames (*Parentalia*, p. 265). The line from Lower Thames Street to Temple Street has been retrieved from the river by embankments, and in certain parts of the line the embankment was formed by substantial walling, such being found at the foot of Fish Street Hill, at the end of Queen Street, and from Broken Wharf to Lambeth Hill (Tite's *Catalogue of Antiquities found in the Excavation at the New Royal Exchange*, 1848, p. xxiv.). Mr. Roach Smith writes—"It was from 8 to 10 feet thick, and about 8 deep, reckoning the top at 9 feet from the present street level, and composed of ragstone and flint, with alternate layers

[1] A chronological list of the tesselated pavements discovered in London between 1681 and 1864 is given in a paper of the late Sir William Tite (*Archæologia*, vol. xxxix. p. 491). It is impossible to say how much more remains hidden many feet below the modern streets.

of red and yellow, plain and curve-edged tiles, cemented by mortar as firm and hard as the tiles, from which it could not be separated. For the foundation strong oaken piles were used, upon which was laid a stratum of chalk and stones, and then a course of hewn sandstones from 3 to 4 feet long, by 2½ in width" (*Archæological Journal*, i. 114). The names of the gates give us no clue as to which of them existed in Roman times, but we cannot doubt that the chief traffic was carried through the city from Ludgate to Aldgate, although some antiquaries have supposed that Newgate was the chief gate on the west side, leading as it would to Holborn, where Roman remains have been discovered. Bishopsgate must have been the principal outlet to the north. Mr. Roach Smith has suggested that outside Newgate there was an amphitheatre built into a hill on the rising ground near what was lately the Little Old Bailey. He had often noticed the precipitous descent from Green Arbor Lane, opposite Newgate into Seacoal Lane and the level space by Fleet prison, and he presumed it to have been an excavation in the side of the hill. Many a smaller town than Londinium possessed a theatre in Roman times (*Middlesex Arch. Trans.*, i. 33). The name Newgate is significant of its recent erection, and it has been remarked that it stands alone among the gates as not being attached to a ward bearing the same name. It is mentioned in an ordinance of Edward I., where it is connected with Ludgate.

A question arises as to the arrangement of the area included within the walls, the course of which has already been traced. There is a strong preponderance of evidence against the belief that the present line of streets follows that of Roman London to any considerable extent. Sir William Tite gave reasons for believing that Bishopsgate Street was not a Roman thoroughfare (*Archæologia*, xxxvi. 203), and in the late excavations in Leadenhall Mr. Loftus Brock found remains of a building which he supposed to be a basilica, apparently crossing the present thoroughfare of Gracechurch Street. Sir William Tite agreed with Dr. Stukeley's suggestion that on the site of the Mansion House (formerly Stocks market) stood the Roman forum, and he states that a line drawn from that spot as a centre would pass by the pavements found on the site of the Excise Office. Besides the forum, Dr. Stukeley suggested the sites of seven other public buildings,—the *Arx Palatina*, guarding the south-eastern angle of the city, where the Tower now stands, the grove and temple of Diana on the site of St. Paul's, an episcopal residence, etc. No traces of any of these buildings have been found, and they are therefore purely conjectural. As to the temple of Diana, Wren formed an opinion strongly adverse to the old tradition of its existence (*Parentalia*, p. 266). Although we know that the Christian church was established in Britain during the later period of Roman domination, there is little to be learnt respecting it, and the Bishop Restitutus who is said to have attended a council on the Continent is a somewhat mythical character.

After the walls the most important points for consideration in relation to Roman London are (1) the existence of a bridge, and (2) the purpose of the London Stone.

1. Dion Cassius, who lived in the early part of the 3d century (*Hist. Rom.*, lib. lx. c. 20), states that there was a bridge over the Thames at the time of the invasion of Claudius (43 A. D.), but he places it a little above the mouth of the river ("higher up"). The position is vague, but, as already stated, the mouth of the Thames in these early times may be considered as not far from where London Bridge now stands. Sir George Airy holds that this bridge was not far from the site of London Bridge (*Proceedings of Institut. Civil Engineers*, xlix. 120), but Dr. Guest was not prepared to allow that the Britons were able to construct a bridge over a tidal river such as the Thames, some 300 yards wide, with a difference of level at high and low water of nearly 20 feet. He therefore suggested that the bridge was constructed over the marshy valley of the Lea, probably near Stratford. It needs some temerity to differ from so great an authority as the late Dr. Guest, but it does strike one as rather surprising that, having accepted the fact of a bridge made by the Britons, he should deny that these Britons possessed a town or village in the place to which he supposes that Aulus Plautius retired. It may be considered certain that there was no bridge over the Thames in the time of Julius Cæsar; for he would not have marched his troops all the way to Coway Stakes in search of a ford if he could have crossed by a bridge at London.

As the Welsh word for "bridge" is "pont," and this was taken directly from the Latin, the inference is almost conclusive that the Britons acquired their knowledge of bridges from the Romans. Looking at the stage of culture which the Britons had probably reached, it would further be a natural inference that there was no such thing as a bridge anywhere in Britain before the Roman occupation; but, if Dion's statement is correct, it may be suggested as a possible explanation that the increased intercourse with Gaul during the hundred years that elapsed between Julius Cæsar's raids and Claudius Cæsar's invasion may have led to the construction of a bridge of some kind across the Thames at this point, through the influence and under the guidance of Roman traders and engineers. If so, the word "pont" may have been borrowed by the Britons before the commencement of the Roman occupation. Much stronger are the reasons for believing that there was a bridge in Roman times. Remains of Roman villas are found in Southwark, which was evidently a portion of Londinium, and it therefore hardly seems likely that a bridge-building people such as the Romans would remain contented with a ferry. Mr. Roach Smith is a strong advocate for the bridge, and remarks, "It would naturally be erected somewhere in the direct line of road into Kent, which I cannot but think pointed towards the site of Old London Bridge, both from its central situation, from the general absence of the foundations of buildings in the approaches on the northern side, and from discoveries recently made in the Thames on the line of the old bridge" (*Archæologia*, xxix. 160). Mr. Smith has, however, still stronger arguments, which he states as follows:—"Throughout the entire line of the old bridge, the bed of the river was found to contain ancient wooden piles; and, when these piles, subsequently to the erection of the new bridge, were pulled up to deepen the channel of the river, many thousands of Roman coins, with abundance of broken Roman tiles and pottery, were discovered, and immediately beneath some of the central piles brass medallions of Aurelius, Faustina, and Commodus. All these remains are indicative of a bridge. The enormous quantities of Roman coins may be accounted for by consideration of the well-known practice of the Romans to make these imperishable monuments subservient towards perpetuating the memory, not only of their conquests, but also of those public works which were the natural result of their successes in remote parts of the world. They may have been deposited either upon the building or repairs of the bridge, as well as upon the accession of a new emperor" (*Archæological Journal*, i. 113).

2. The "London Stone" has very generally been supposed to be a "milliarium" or central point for measuring distances, but Sir Christopher Wren believed it was part of some more considerable monuments in the forum, and his reason for this belief was that "in the adjoining ground on the south side (upon digging for cellars after the great fire) were discovered some tesselated pavements and other extensive remains of Roman workmanship and buildings" (*Parentalia*, pp. 265, 266). King,[1] in his *Munimenta Antiqua*, writes—"London Stone, preserved with such reverential care through so many ages, and now having its top encased within another stone in Cannon Street, was plainly deemed a record of the highest antiquity of some still more important kind; though we are at present unacquainted with the original intent and purport for which it was placed. It is fixed at present close under the south wall of St. Swithin's Church, but was formerly a little nearer the channel facing the same place,—which seems to prove its having had some more ancient and peculiar designation than that of having been a Roman milliary, even if it were ever used for that purpose afterwards. It was fixed deep in the ground, and is mentioned so early as the time of Athelstan, king of the West Saxons, without any particular reference to its having been considered as a Roman milliary stone." Holinshed (who was followed by Shakespeare in *2 Henry VI.*, act 4 sc. 4) tells us that when Cade, in 1450, forced his way into London, he first of all proceeded to London Stone, and having struck his sword upon it, said in reference to himself and in explanation of his own action, "Now is Mortimer lord of this city." Mr. H. C. Coote, in a paper published in the *Trans. London and Middlesex Arch. Soc.* for 1878, points out that this act meant something to the mob who followed the rebel chief, and was not a piece of foolish acting. Mr. G. L. Gomme (*Primitive Folk-Moots*, pp. 155, 156) takes up the matter at this point, and places the tradition implied by Cade's significant action as belonging to times when the London Stone was, as other great stones were, the place where the suitors of an open-air assembly were accustomed to gather together and to legislate for the government of the city. Corroborative facts have been gathered from other parts of the country, and, although more evidence is required, such as we have is strongly in favor of the supposition that the London Stone is a prehistoric monument.

SAXON (449–1066).—At the beginning of the 5th century the Roman legions left Britain. From this period to the arrival of the Saxons there was a space of time when the Briton was left alone, and there is no reason to believe that

[1] [Edward (1735–1807), President of Society of Antiquaries in London, and writer on prophecy.—AM. ED.]

London ceased to be the important commercial town which it had grown to be. After the Saxon iuvasion we do not hear of the city being ravaged, and it possibly held its own under the various vicissitudes it had to pass through, although Dr. Guest writes that "good reason may be given for the belief that even London itself for a while lay desolate and uninhabited" (*Archæological Journal*, xix. 219). About 449 or 450 the invaders first settled in Britain, and in 457 Hengist and Æsc fought against the Britons at Crayford, driving them out of Keut. The vanquished fled to London in great terror, and apparently found a shelter there.[1] The Saxons disliked walled towns, and in many instances they destroyed those which they conquered. This was not done in London, and it is just possible that the Britons may have been able to purchase their freedom from destruction. We have, however, little or no data upon which we can form an opinion. Mr. Kemble wrote of towns generally that the Saxons neither cared to take possession of them nor took the trouble to destroy them. They enslaved the inhabitants or expelled them, as a mere necessary precaution and preliminary to their own peaceable possession (*Saxons in England*, ii. 296). The only question is whether London, being an exceptional city, had an exceptional fate. Along the banks of the Thames are several small havens whose names have remained to us, such as Rotherhith, Lambhith (Lambeth), Chelchith (Chelsea), and it is not unlikely that the Saxon who would not settle in the city itself associated himself with these small open spots. Places were thus founded over a large space which otherwise might have remained unsettled. At what time the Saxons got over their repugnance and settled in London we cannot say, but the city is described by Bede as being in 604 the metropolis of the East Saxons, and an emporium of many peoples who came to it by sea and land. The relics of Roman London are, as we have already seen, very numerous; but we know nothing of the inhabitants. There is little human interest in the history. When we come to Saxon London this position is reversed. There are no remains worthy of notice, but there is abundance of life. London appears to have held a very exceptional position, and to have been somewhat like a German free city. The Londoner within his strong walls defied the invader, and the Dane frequently attempted to conquer the city in vain. Mr. Freeman does justice to the stout heart of the Londoner, and calls London during this period "the stronghold of English freedom." The Saxon Chronicle has little to tell of London between the 5th and 9th centuries. The great change accomplished by Augustine, in converting the Jutes and the Saxons to Christianity, is recorded in a few short lines; and we are told that in the year 604 Augustine consecrated two bishops, Mellitus and Justus, and that Ethelbert, king of Keut, gave Mellitus a bishop's see at London, then a part of the kingdom of the East Saxons, whose king, Siebert, was a tributary of his uncle the king of Kent. What became of the cathedral which we may suppose to have existed in London during the later Roman period we cannot tell, but we may guess that it was destroyed by the heathen Saxons. Bede records that the church of St. Paul was built by Ethelbert, and from that time to this a cathedral dedicated to St. Paul has stood upon the hill looking down on Ludgate. Mellitus became archbishop of Canterbury, and was succeeded in the see of London by Cedda, who was succeeded by Wina. Then came Theodore, archbishop of Canterbury, better known as the sainted Erkenwald, whose shrine was one of the chief glories of old St. Paul's. He died on April 30, 693, a day which was kept in memory in his cathedral by special offices. We must now pass over nearly a century and a half to the time when the Danes were harassing the country after the death of Egbert. The chronicler records that in the year 839 there was a great slaughter at London, but he gives no particulars. In 851 the Danes plundered the city and made themselves masters of it. Sharon Turner quotes a conveyance of a place in London dated 857, which gives a slight piece of local information (*Anglo-Saxons*, ii. 575). The name of the place was Ceolmandingehaga, and it was situated not far from the West Gate. We cannot tell whether Ludgate was meant or some other gate which marked the extent of the liberties on the west. In 871 the chronicler affirms that Alfred fought nine great battles against the Danes in the kingdom south of the Thames, and that the West Saxons made peace with them. In the next year the Danes went from Reading to London, and there took up their winter quarters. Then the Mercians made peace with them. In 886 Alfred overcame the Danes, restored London to its inhabitants, rebuilt its walls, reannexed the city to Mercia, and committed it to Ethelred, aldermau of Mercia. Then, as the chronicler writes, "all the Angle race turned to him (Alfred) that were not in bondage of the Danish men." In 896 the Londoners came off victorious in their encounters with the Danes. The kiug obstructed the river so that the enemy could not bring up their ships, and they therefore abandoned them. The Londoners broke up some, and brought the strongest and best to London. In 912 Ethelred, the alderman of the Mercians, who had been placed in authority by Alfred, died, and Edward the Elder took possession of London and Oxford, "and all the lands which thereto belouged." Again we fiud a break in the continuity of the history, and pass on to the year 959, when King Edgar gave Dunstan the bishopric of Worcester, and afterwards that of London. In 962 there was a great fever and mortality in London, and St. Paul's was burnt. It was, however, founded again in the same year. Iu the reign of Ethelred II. the Danes were more successful in their operations against London, but the inhabitants resisted stoutly. Snorre the Icelander tells us that the Danes fortified Southwark with ditch and rampart, which the English assailed in vain. In 982 London was burnt, and in 994 Olaf aud Sweiu (the father of Canute) came with ninety-four ships to besiege it. They tried to set the city on fire, but the townsmen did them more harm than they "ever weened." The chronicler piously adds that "the holy Mother of God on that day manifested her mercy to the townsmen, and delivered them from their foes." The Danes went from the town and ravaged the neighborhood, so that in the end the king and his witan agreed to give sixteen thousand pounds to be relieved of the presence of the enemy. In the year 1009 the Danes frequently attacked London, but they had no success, and fared ill in their attempts. The Londoners withstood Swein in 1013, but in the end they submitted and gave him hostages. Three years after this, Ethelred died in London, and such of the witan as were there and the townsmen chose Edmund Ironside for king, although the witan outside London had elected Cauute. Canute's ships were then at Greenwich ou their way to London, where they soon afterward arrived. The Danes at once set to work to dig a great ditch by Southwark, and then dragged their ships through to the west side of the bridge. They were able after this to keep the inhabitauts from either going in or out of the town. In spite of all this, after fighting obstinately both by land and by water, the Danes had to raise the siege of Londou, and take the ships to the river Orwell. After a glorious reign of seven months Edmund died in Londou, and Canute became master of Englaud. The tribute which the townsmen of London had to pay was £10,500, about one-seventh of the amount which was paid by all the rest of the English nation. This shows the growing importance of the town. From this time there appears to have been a permanent Danish settlement in London. There is but little more to be said of the history of Saxon London than that Edward the Confessor held his witanagemôt there, and built and consecrated the Abbey of Westminster. During the later part of the Saxon period Westminster (originally Thorney Island) had been growing iuto some importance. Tradition affirmed that on the site of Westminster Abbey a temple of Apollo once stood, which was destroyed by an earthquake in the reign of the emperor Antouinus Pius. Out of the ruins King Lucius founded a church, 170 A. D. Sir Christopher Wren imagined that the monks, finding that the Londoners pretended to a temple of Diaua where St. Paul's now stands, did not wish to be behindhand in antiquity (*Parentalia*, p. 296). The figment respecting King Lucius is of about equal authority. There is more reason for believing that Siebert, king of the East Saxons, may have built, as Stow says he did, "a church to the honor of God and St. Peter, on the west side of the city of London." His sons relapsed into idolatry, and left the church to the mercy of the Danes. In a charter of King Edgar, dated 951, the original boundary of Westminster is clearly defined. This charter is marked by Kemble as doubtful (*Codex Dipl.*, dlxix.); but, if not of the date given, it is believed by competent authorities to be of great antiquity. Edward the Coufessor took a particular interest in Westminster, and occupied much time in superintending the erection of a new church there. On Childermas Day (December 28), 1065, the monastery was consecrated, and on the following "twelfth mass eve" the king died, being buried on the next day in the new church. The abbot of Westminster's manor is fully described in Domesday, but there is no mention of

[1] If the London-burg here mentioned in the Saxon Chronicle is not London south of the Thames (or Southwark), the fugitives must have crossed the river, and if so this is additional reason for believing that there was then a bridge. The same reasoning will apply to what is related further on, of the Danes crossing to Surrey in the year 851, as it is not likely that a ferry would suffice on these occasions. Moreover, a bridge is shortly after specially mentioned by the chronicler.

a palace, so that it has been conjectured that the Confessor lived in the monastery itself. With regard to the buildings of London we are left to conjecture. As several of the Saxon kings lived in the city, we must conclude that they possessed a palace of some kind, and around this other buildings would arise. A port such as London naturally drew foreigners from all parts, and various communities of these strangers are believed to have settled here as early as the 8th century. With regard to the government of the city it is generally supposed that many of its institutions are due to Alfred the Great, although Mr. Coote with great ingenuity traces them back to the ordinances of the Roman *municipium*. The famous dooms of the city of London (Athelstan) are stated in the preamble to be the ordinance of "the bishops and the reeves belonging to London." William the Conqueror's charter, which he granted soon after his accession, is addressed to William the bishop and Godfrey the portreeve. The office portreeve had then been long established, although we know but little of its origin. It was usually an office of popular election, but the king often interfered in the appointment. Considerably more than a century had elapsed after the Conquest before the title of portreeve gave way to that of mayor, as the designation of the chief officer of the city of London.

NORMAN (1066–1154).—After the battle of Hastings certain of the defeated chiefs retired upon London and urged the men in power to resist the Norman, and set up Edgar Atheling as king, which, as the Saxon chronicler says, "was indeed his natural right." On hearing of this action William marched towards London, and was attacked by the Saxon party at Southwark, who were repulsed by the Norman horse, but with such loss to the latter that William thought it imprudent to lay siege to the city at that time. The Londoners began now to see the hopelessness of their cause, and Archbishop Eldred, and Edgar, and Earls Edwin and Morkere, and "the best men in London" repaired to Berkhampstead, where they submitted themselves and swore fealty to the Conqueror. One of the earliest acts of the Conqueror was to commence the erection of a citadel which should overawe the citizens and give him the command of the city. Some writers have supposed that King Alfred erected a palace or castle on the site of the Tower, but without sufficient authority, and a writer in the *Quarterly Review* (art. "Middlesex," vol. cl. p. 48 *note*) says "the Tower almost certainly stands on foreshore which was not dry land before the Conquest." As the Tower was situated at the eastern limit of the city, so not far from the western extremity was built a strong fortification called Baynard's Castle after its founder Baynard, one of the followers of the Conqueror. In the second year of his reign William granted the remarkable charter written in Anglo-Saxon which still exists among the archives of the city of London. There are but four lines and a quarter, and the size of the slip of parchment is only 6 inches by 1 inch. It runs thus—"William the king greets William the bishop, Godfrey the portreeve, and all the burgesses within London, both French and English. And I grant that they be all law-worth, as they were in Edward the king's days. And I will that each child be his father's heir after his father's days. And I will not suffer that any man do you wrong. God keep you." William Stigand, the bishop of London, was a Norman, and possibly had some influence with the king in obtaining this charter. A wonderful improvement in the appearance of the cities of the country almost immediately followed the advent of the civilizing Norman. Within a few years the whole area of London must have been changed, and handsome buildings arose as if by magic in all parts of the city. Many Normans had settled in London during the reign of Edward the Confessor, but after the Conquest they swarmed in and naturally became the dominant party. In August, 1077, occurred a most extensive fire, such a one, says the Chronicle, as "never was before since London was founded." This constant burning of large portions of the city is a marked feature of its early history, and we must remember that, although stone buildings were rising on all sides, these were churches, monasteries, and other public edifices; the ordinary houses remained as before, small wooden structures. The White Tower, the famous keep of the Tower of London, was commenced by Gundulph, bishop of Rochester, about the year 1078. In 1083 the old cathedral of St. Paul's was commenced on the site of the church which Ethelbert is said to have founded in 610. But four years afterwards the chronicler tells us "the holy monastery of St. Paul, the episcopal see of London, was burnt, and many other monasteries, and the greatest and fairest part of the whole city." In this same year (1087) William the Conqueror died. In 1090 a tremendous hurricane passed over London, and blew down six hundred houses and many churches. The Tower was injured, and a portion of the roof of the church of St. Mary-le-Bow, Cheapside, was carried off and fell some distance away, being forced into the ground as much as 20 feet, a proof of the badness of the thoroughfares as well as of the force of the wind. William Rufus inherited from his father a love for building, and in the year 1097 he exacted large sums of money from his subjects with the object of carrying on some of the undertakings he had in hand. These were the walling round of the Tower, the rebuilding of London Bridge, which had been almost destroyed by a flood, and the erection of the great work with which his name is most generally associated, Westminster Hall. In 1100 Rufus was slain, and Henry I. was crowned in London. This king granted to the citizens their first real charter, in which he promised to observe the laws of the Confessor and to redress many special grievances; but he paid little attention to his engagements, and constantly violated the articles of his charter. When Stephen seized the crown on the death of Henry I., he tried successfully to obtain the support of the people of London. He published a charter confirming in general terms the one granted by Henry, and commanding that the good laws of Edward the Confessor should be observed. The citizens, however, did not obtain their rights without paying for them, and in the year 1139 they paid Stephen one hundred marks of silver to enable them to choose their own sheriffs. In this reign all the all-powerfulness of the Londoners is brought very prominently forward. Stephen became by the shifting fortune of war a prisoner, and the empress Matilda might, if she had had the wisdom to favor the citizens, have held the throne, which was hers by right of birth. She, however, made them her enemies by delivering up the office of justiciary of London and the sheriffwick to her partisan Geoffrey, earl of Essex, and attempting to reduce the citizens to the enslaved condition of the rest of the country. This made her influential enemies, who soon afterwards replaced Stephen upon the throne. The Norman era closes with the death of Stephen, 1154.

We have already alluded to the great number of ecclesiastical foundations which marked the Norman period, and will here note some of the chief of these, to show how completely the new buildings must have changed the whole appearance of London, and raised it from a mean congregation of houses to the rank of a city, having features of considerable architectural merit. The college of St. Martin-le-Grand within Aldersgate was founded in the year 1056, and its rights were confirmed by the Conqueror in the second year of his reign. He gave the dean and secular priests more land, and added to their privileges. A nunnery of the Benedictine order, dedicated to St. Leonard, near Bromley, was founded in the reign of William the Conqueror by William, bishop of London, for a prioress and nine nuns, and in Stephen's reign Sir William Mountfitchet founded an abbey at Stratford Langton, which was subsequently known as West Ham Priory. In 1082 a convent of monks dedicated to St. Saviour was founded at Bermondsey by Alwin Child, a wealthy citizen, and seven years afterwards some Cluniac monks came from France and settled in the new convent, of which one of them was chosen the first prior. In 1094 William Rufus added the manor of Bermondsey to the other benefactions of this fortunate monastery, which became very powerful, and was frequently used as a royal residence. At Clerkenwell two religious houses were established in the year 1100, viz., the Knights Hospitallers of St. John of Jerusalem and the priory of St. Mary for nuns of the Benedictine order. It was said that the number of monasteries built in the reign of Henry I. was so great that almost all the laborers became bricklayers and carpenters, and there was some discontent in consequence. Matilda or Maude, the wife of Henry I., was much interested in the foundation of these religious houses. She established the priory of Holy Trinity, called Christ Church, which was situated to the north of Aldgate, in 1108, and about 1110 two hospitals, one for lepers at St. Giles's-in-the-Fields, and the other for cripples at Cripplegate. The priory of St. Bartholomew was founded a few years earlier, and the Benedictine nunnery of St. John the Baptist at Halliwell near Shoreditch soon afterwards. The Knights Templars made their first habitation in the neighborhood of London in 1118, and did not remove from Holborn to Fleet Street until nearly seventy years afterwards. The royal hospital of St. Katherine's at the Tower was originally founded by Matilda, wife of King Stephen, and the famous St. Stephen's chapel at Westminster owes its origin to the king himself. It was, however, rebuilt by Edward II. It will be seen from the above list that a large proportion of these buildings were outside the walls, and this shows how extensive the outskirts of the city had become in Norman times. No doubt

many of these religious persons sought out somewhat quiet neighborhoods, but around each of them would naturally grow up villages formed by those who were chiefly dependent upon the monks and nuns.

PLANTAGENET (1154–1485).—Henry II. appears to have been to a certain extent prejudiced against the citizens of London on account of their attitude towards his mother, and he treated them with some severity. On several occasions he exacted large sums from the city, which, although they were euphemistically styled *dona*, cannot be considered as free gifts. The severity appears to have been necessary, and was attended with good results. The streets were in a most dangerous condition at night, and bands of a hundred and more would sally forth to rob the houses of the wealthy. In 1175 some of these men were taken prisoners, and one of them was found to be a citizen of good credit and considerable wealth named "John the Olde." He offered the king five hundred marks for his life, but Henry was inflexible, and after the man had been hanged the city became more quiet. In 1176 the rebuilding of London Bridge with stone was commenced by Peter of Colechurch. This was the bridge which after much subsequent tinkering was pulled down early in the present century. It consisted of twenty stone arches and a drawbridge. There was a gatehouse at each end and a chapel or crypt in the centre, dedicated to St. Thomas of Canterbury, in which Peter of Colechurch the architect was buried in 1205. In 1184 the Knights Templars removed from Holborn to the New Temple in Fleet Street, and in the following year the beautiful Temple church was built. All this activity of building proves that the citizens were wealthy and their city handsome. This is corroborated by the interesting work of Fitzstephen, the monk of Canterbury, which was written at this time. Fitzstephen has left us the first picture of London, and a very vivid one it is. He speaks of its wealth, commerce, grandeur, and magnificence,—of the mildness of the climate, the beauty of the gardens, the sweet, clear, and salubrious springs, the flowing streams, and the pleasant clack of the water-mills. Even the vast forest of Middlesex, with its densely wooded thickets, its coverts of game, stags, fallow deer, boars, and wild bulls is pressed into the description to give a contrast which shall enhance the prosperous beauty of the city itself. Fitzstephen's account of the sports of the people is particularly interesting. He tells how, when the great marsh that washed the walls of the city on the north (Moorfields) was frozen over, the young men went out to slide and skate and sport on the ice. Skates made of bones have been dug up of late years in this district. This sport was allowed to fall into disuse, and was not again prevalent until it was introduced from Holland after the Restoration. In the first year of Richard I. the court of aldermen ordained that for the future houses should not be built of wood, but that they should have an outside wall of stone raised 16 feet from the ground, and be covered with slate or baked tile. This ordinance must have fallen into desuetude, for the houses continued largely to be built of wood. We learn that most of the houses were plastered and whitewashed. One of the earliest objections which the Londoners made to the use of sea-coal was that the smoke from it blackened the white walls of their buildings. The first mayor of London was Henry Fitz Alwin, who was elected in 1189, and held the office until 1212.[1]

London had to pay heavily towards Richard's ransom; and, when the king made his triumphal entry into London after his release from imprisonment, a German nobleman is said to have remarked that had the emperor known of the wealth of England he would have insisted on a larger sum. The Londoners were the more glad to welcome Richard back in that the head of the regency, Longchamp, bishop of Ely, was very unpopular from the encroachments he made upon the city with his works at the Tower. The first charter by which the city claims the jurisdiction and conservancy of the river Thames was granted by Richard I. John granted several charters to the city, and it was expressly stipulated in Magna Charta that the city of London should have all its ancient privileges and free customs. The citizens opposed the king during the wars of the barons. In the year 1215 the barons having received intelligence secretly that they might enter London with ease through Aldgate, which was then in a very ruinous state, removed their camp from Bedford to Ware, and shortly after marched into the city in the night-time. Having succeeded in their object, they determined that so important a gate should no longer remain in a defenceless condition. They therefore spoiled the religious houses and robbed the monastery coffers in order to have means wherewith to rebuild it. Much of the material was obtained from the destroyed houses of the unfortunate Jews, but the stone for the bulwarks was obtained from Caen, and the small bricks or tiles from Flanders. The church of St. Mary Overy (now St. Saviour's), Southwark, was begun in the year 1208, and in 1221 the foundation stone of the lady chapel at Westminster Abbey was laid by Henry III. We have alluded to the great change in the aspect of London and its surroundings made during the Norman period by the establishment of a large number of monasteries. A still more important change in the configuration of the interior of London was made in the 13th century, when the various orders of the friars established themselves there. The Benedictine monks preferred secluded sites; the Augustinians did not cultivate seclusion so strictly; but the friars chose the interior of towns by preference. The Black, Preaching, or Dominican Friars settled near Holborn, in what was afterwards Lincoln's Inn, in 1221, and removed to the ward of Castle Baynard in 1276, when the city wall was rebuilt to enlarge their boundaries. The district where the friary was built still retains its name. In 1224 John Iwyn or Ewin made over to the Grey Friars (or Franciscans) an estate situated in the ward of Farringdon Within and in the parish of St. Nicholas in the Shambles, and on this site the first convent of the order was erected. The site is now occupied by the Blue Coat School. In 1241 the White Friars or Carmelites settled in a precinct or liberty between Fleet Street and the Strand, which still retains their name. In 1253 the Austin Friars or Friars Eremites were founded in Broad Street ward, and the last of these friaries to be established was that of the Crutched or Crossed Friars in 1298. By the establishment of these religious houses two-thirds of the entire area of London was occupied by convents and hospitals. This is the most marked characteristic of Plantagenet London. We have no record of the date at which Temple Bar first marked out the extent of the liberties of the city, but as late as the end of the 14th century Fleet Street was described as being in the suburbs. During the Norman period the road from the city to Westminster was quite open, but soon afterwards a commencement was made in building. The Savoy was built in 1245 by Peter, earl of Savoy and Richmond, uncle of Eleanor, wife of Henry III.; and in this king's reign the friars of the order of St. Mary de Arena are supposed to have established themselves near the site of Durham House (now the Adelphi). About the same time William Marshal, earl of Pembroke, founded and endowed a hospital and convent called St. Mary Rouncivale at the village of Charing, so that in Henry III.'s reign there must have been several houses on the line of route to Westminster. Fitzstephen describes the latter place as follows:—"On the west also, higher up the bank of the river, the royal palace rears its head, an incomparable structure, furnished with a breastwork and bastions, situated in a populous suburb, at a distance of two miles from the city." In the reign of Edward I. the mayor offended the king, and the citizens were for a time deprived of their right of electing their chief magistrate. Gregory de Rokesley the mayor, the sheriffs, the aldermen, and other dignitaries of the city were summoned to appear on the 29th June, 1285, before John de Kirkeby, treasurer, and the other justiciars of the king in the Tower of London for the purpose of holding inquests there. Now the mayor held that he was not bound to answer such a summons as this unless he had forty days' notice, so he resigned his mayoralty at Allhallows, Barking, and delivered the common seal of the city to Stephen Aswy and other aldermen, and then entered the Tower with the rest as an alderman only. This action incensed the king greatly, and John de Kirkeby was commanded to take over the mayoralty, a warden being appointed by the royal authority. This arrangement continued until 1297, when Edward granted the prayer of the citizens, and allowed them again to elect a mayor. Royal wardens had filled the mayor's seat from 1265 to 1268, but in the first charter of Edward I. the following concession was made: "Also that the liberties of the city of London shall not be taken into the hand of his lordship the king for any personal trespass or personal judgment of any officer of the said city; and that no warden shall in the same on such pretext be appointed" (*Liber Albus*, translated by Riley, pp. 14, 131). In 1285 the first attempt was made to supply London with water artificially, and the great conduit in West Cheap (or Cheapside) was commenced. This lead cistern, which was castellated with stone, was supplied with water conveyed in leaden pipes from Tyburn. Soon afterwards a nobler building was erected in Cheapside. In 1290 the beloved Eleanor of Castile died, and her husband erected stone crosses where her body had rested. Two of these crosses were in London,

[1] He was first admitted to the chief magistracy as bailiff, and there appears to have been considerable variety in the titles used at this time. We learn from the *Liber Albus* that the chief officer was sometimes called "justiciar" and "chamberlain."

and there is some little difficulty in understanding why the two stations were so near each other. It has been suggested that the body really rested at St. Paul's Cathedral. Cheapside Cross was erected by Michael of Canterbury, and cost £300, and Charing Cross, the most sumptuous of the series, cost £450. It was commenced by Richard de Crundale, and completed after his death by Roger de Crundale. In this same year (1290) the Jews were expelled from England. The district in London in which they had lived since William the Conqueror's day came to be called the Old Jewry, but when the Jews returned to England after many centuries of exile most of them settled in the neighborhood of Aldgate.

Smithfield is mentioned by Fitzstephen as a market for horses, and from this writer we obtain its correct etymology (the smooth field). As early as the reign of Henry III. it had become known as the place for executions. Close by a grove of elm trees that gave their name to the place Sir William Wallace was executed in the year 1305, and there also Mortimer experienced a similar fate five and twenty years afterwards. The history of Smithfield from that day has been a record of executions, jousts, and markets.

In 1313 the celebrated order of the Knights Templars fell, and Edward II. gave their house in Fleet Street to Aymer de Valence, earl of Pembroke. At the earl's death the property passed to the Knights of St. John of Jerusalem, who leased the Inner and Middle Temples to the students of the common law and the Outer Temple to Walter Stapleton, bishop of Exeter, and lord treasurer. The Charterhouse stands on a piece of ground which had been used in 1349 as a burial-place for the thousands who died in that year of the plague. In 1371 Sir Walter Manny founded there a priory of Carthusian monks.

One of those pageants for which the streets of London were so famous took place in 1356 when Edward the Black Prince brought the French king John a prisoner from the battle of Poitiers. It is not necessary to do more than allude to this here, as the incident is a part of English history.

We have now arrived at the period of one of the greatest Londoners that ever lived. The life of Geoffrey Chaucer throws a living interest around the several places with which he was associated. His father was a vintner in Thames Street, the garden of whose house was bounded by the Wall Brook. In 1374 Chaucer was appointed comptroller of the customs, and in the same year he went to live in the dwelling-house above the gate of Aldgate. In 1389 he was appointed clerk of the works at Westminster, the Tower of London, and other places. In March, 1390, we find him on the Thames bank repair commission, and in May of the same year he was employed in setting up scaffolds in Smithfield for Richard II. and his queen (Anne of Bohemia) to see the jousts at that place. His duties took him to the mews for the king's falcons at Charing Cross, and in 1390 he was robbed of some of the king's money on the high road at Westminster. We thus see that traces of the "morning star of English poetry" are to be found in all parts of London.

In 1381 another of the stirring incidents of English history occurred in London. The threatening insurrection of Wat Tyler was suppressed when the leader was killed by Sir William Walworth in Smithfield. Before that the rebels had done great damage to property in London and Southwark. About this time two very important public works were commenced. Westminster Hall was repaired by Richard II. in 1397; the walls were carried up 2 feet higher, the windows were altered, and a new roof constructed. In 1411 the Guildhall was built, and the courts were removed from Aldermanbury.

During the troubles of the 15th century the authorities had seen the necessity of paying more attention to the security of the gates and walls of the city, and when Thomas Nevill, son of Thomas, Lord Fauconbergh, made his attack upon London in 1471 he experienced a very spirited resistance. He first attempted to land from his ships in the city, but the Thames side from Baynard's Castle to the Tower was so well fortified that he had to seek a quieter and less prepared position. He then set upon the several gates in succession, and was repulsed at all. On the 11th of May he made a desperate attack upon Aldgate, followed by 500 men. He won the bulwarks and some of his followers entered into the city, but the portcullis being let down these were cut off from their own party and were slain by the enemy. The portcullis was drawn up, and the besieged issued forth against the rebels, who were soon forced to fly.

When Richard, duke of Gloucester, laid his plans for seizing the crown, he obtained the countenance of the lord mayor, Sir Edmund Shaw, whose brother Dr. Shaw praised Richard at Paul's Cross. Crosby Hall, in Bishopsgate Street, then lately built, was made the lodging of the Protector. There he acted the accessible prince in the eyes of the people, for the last of the Plantagenets was another of the usurpers who found favor in the eyes of the men of London. His day, however, was short, and with the battle of Bosworth ends Plantagenet London.

TUDOR (1485–1603).—It was during this period that the first maps of London were drawn. No representation of the city earlier than the middle of the 16th century has been discovered, although it seems more than probable that some plans must have been produced at an earlier period.[1] The earliest known view is the drawing of Van den Wyngaerde in the Bodleian Library (dated 1550). The so-called Aggas map is a few years later in date; Braun and Hagenberg's map was published in 1572–73; and Norden's maps of London and Westminster are dated 1593. These maps were pasted upon walls, and must have been largely destroyed by ordinary wear and tear. It is curious that the only two existing copies of Aggas's map[2] were published in the reign of James I., although apparently they had not been altered from the earlier editions of Elizabeth's reign which have been lost. By the help of these maps we are able to obtain a very clear notion of the extent and chief characteristics of Tudor London. Henry VII. did little to connect his name with the history of London with the exception of the erection of the exquisite specimen of florid Gothic at Westminster Abbey, which is known by his name. Soon after this king obtained the throne he borrowed the sum of 3000 marks from the city, and moreover paid it at the appointed time. The citizens were so pleased at this somewhat unexpected occurrence that they willingly lent the king £6000 in 1488, which he required for military preparations against France. In 1497 London was threatened by the rebels favorable to Perkin Warbeck, who encamped on Blackheath on the 17th of June. At first there was a panic among the citizens, but subsequently the city was placed in a proper state of defence, and the king himself encamped in St. George's Fields. On June 22 he entirely routed the rebels; and some time afterwards Perkin Warbeck gave himself up, and was conducted in triumph through London to the Tower.

About this time and in several subsequent years the sweating sickness raged in London. This disease (*Sudor Anglicus*) was considered peculiar to England. The sanitary condition of the houses at the time must have been most deplorable, and the plague and other diseases were constantly reappearing until the great fire cleared away all the abominable buildings that formed centres of infection.

During the reign of Henry VII. as well as during that of his son London was constantly the scene of gorgeous pageants. In 1512 the greater part of the palace of Westminster was burned, and Henry VIII. had no suitable residence until 1529, when he obtained Wolsey's magnificent house called York Place, and named it Whitehall. That much of the present London was at this time in a wild and uncultivated condition is proved by a proclamation of Henry VIII., the object of which was "to preserve the partridges, pheasants, and herons from his palace at Westminster to St. Giles's-in-the-Field, from thence to Islington, Hampstead, and Hornsey Park."

As the chief feature of Norman London was the foundation of monasteries, and the chief feature of Plantagenet London was the establishment of friaries, so Tudor London was specially characterized by the suppression of the whole of these religious houses, and also of the almost numberless religious guilds and brotherhoods. When we remember that about two-thirds of the area of London was occupied by these establishments, and that about a third of the inhabitants were monks, nuns, and friars, it is easy to imagine how great must have been the disorganization caused by this root and branch reform. One of the earliest of the religious houses to be suppressed was the hospital of St. Thomas of Acon (or Acre) on the north side of Cheapside, the site of which is now occupied by Mercers' Hall. The larger houses soon followed, and the Black, the White, and the Grey Friars, with the Carthusians and many others, were all condemned in November, 1538.

Love of show was so marked a characteristic of Henry VIII. that we are not surprised to find him encouraging the citizens in the same expensive taste. On the occasion of

[1] "A map of London engraved on copper-plate, dated, 1497," which was bought by Ferdinand Columbus during his travels in Europe about 1518–25, is entered in the catalogue of Ferdinand's books, maps, etc., made by himself and preserved in the Cathedral Library at Seville, but there is no clue to its existence. If it could be found it would be eagerly scanned by topographers, although possibly there would be little difference from the later maps that we possess, for the town did not extend very rapidly in those early times.

[2] One is in the Guildhall Library, and the other among the Pepysian maps in Magdalene College, Cambridge.

his marriage with Catharine of Aragon the city was gorgeously ornamented with rich silks and tapestry, and Goldsmiths' Row (Cheapside) and part of Cornhill were hung with golden brocades. When on the eve of St. John's Day, 1510, the king in the habit of a yeoman of his own guard saw the famous march of the city watch, he was so delighted that on the following St. Peter's Eve he again attended in Cheapside to see the march, but this time he was accompanied by the queen and the principal nobility. The cost of these two marches in the year was very considerable, and, having been suspended in 1528 on account of the prevalence of the sweating sickness, they were soon afterwards forbidden by the king, and discontinued during the remainder of his reign. Sir John Gresham, mayor in 1548, revived the march of the city watch, which was made more splendid by the addition of three hundred light horsemen raised by the citizens for the king's service.

The best mode of utilizing the buildings of the suppressed religious houses was a difficult question left unsolved by Henry VIII. That king, shortly before his death, founded St. Bartholomew's Hospital, "for the continual relief and help of an hundred sore and diseased," but most of the large buildings were left unoccupied to be filled by his successor. The first parliament of Edward's reign gave all the lands and possessions of colleges, chantries, etc., to the king, when the different companies of London redeemed those which they had held for the payment of priests' wages, obits, and lights at the price of £20,000, and applied the rents arising from them to charitable purposes. In 1550 the citizens purchased the manor of Southwark, and with it they became possessed of the monastery of St. Thomas, which was enlarged and prepared for the reception of "poor, sick, and helpless objects." Thus was founded St. Thomas's Hospital, which was moved to Lambeth in 1870–71. Shortly before his death Edward founded Christ's Hospital in the Grey Friars, and gave the old palace of Bridewell to the city, "for the lodging of poor wayfaring people, the correction of vagabonds and disorderly persons, and for finding them work." On the death of Edward VI. Lady Jane Grey was received at the

Norden's Map of Tudor London.

Tower as queen, she having gone there by water from Durham House in the Strand. The citizens, however, soon found out their mistake, and the lord mayor, aldermen, and recorder proclaimed Queen Mary at Cheapside. London was then gay with pageants, but when the queen made known her intention of marrying Philip of Spain the discontent of the country found vent in the rising of Sir Thomas Wyat, and the city had to prepare itself against attack. Wyat took possession of Southwark, and expected to have been admitted into Loudon; but finding the gates shut against him and the drawbridge cut down, he marched to Kingston, the bridge at which place had been destroyed. This he restored, and then proceeded towards London. In consequence of the break down of some of his guns he imprudently halted at Turnham Green. Had he not done so it is probable that he might have obtained possession of the city. He planted his ordnance on Hay Hill, and then marched by St. James's Palace to Charing Cross. Here he was attacked by Sir John Gage with a thousand men, but he repulsed them and reached Ludgate without further opposition. He was disappointed at the resistance which was made, and after musing a while "upon a stall over against the Bell Savadge Gate" he turned back. His retreat was cut off, and he surrendered to Sir Maurice Berkeley. We have somewhat fully described this historical incident here because it has an important bearing on the history of London, and shows also the small importance of the districts outside the walls at that period.

We now come to consider the appearance of London during the reign of the last of the Tudors. At no other period were so many great men associated with its history; the latter years of Elizabeth's reign are specially interesting to us, because it was then that Shakespeare lived in London, and introduced its streets and people into his plays. In those days the frequent visitatiou of plagues made men fear the gatheriug together of multitudes. This dread of pestilence, united with a puritanie hatred of plays, made the citizens do all they could to discountenance theatrical entertainments. The queen acknowledged the validity of the first reason, but sho repudiated the religious objection, provided ordinary care was taken to allow "such plays only as were fitted to yield honest recreation and no example of evil." On April 11, 1582, the lords of the council wrote to the lord mayor to the effect that, as "her Majesty sometimes took delight in those pastimes, it had been thought not unfit, having regard to the season of the yeat and the clearance of the city from

infection, to allow of certain companies of players in London, partly that they might thereby attain more dexterity and perfection the better to content her Majesty" (Analytical Index to the *Remembrancia*). When theatres were established the lord mayor took care that they should not be built within the city. The "Theatre" and the "Curtain" were situated at Shoreditch; the "Globe," the "Rose," and the "Hope" on the Bankside; and the Blackfriars theatre, although within the walls, was without the city jurisdiction.

In 1561 St. Paul's steeple and roof were destroyed by lightning, and the spire was never replaced This circumstance allows us to test the date of certain views; thus Wyngaerde's map has the spire, but Aggas's map is without it. In 1566 the first stone was laid of the "Burse," which owed its origin to Sir Thomas Gresham, and in 1571 Queen Elizabeth changed its name to the Royal Exchange, "so to be called from thenceforth and no otherwise."

A proclamation was issued in 1580 prohibiting the erection within 3 miles of the city gates of any new houses or tenements "where no former house hath been known to have been." In a subsequent proclamation the queen commanded that only one family should live in one house, that empty houses erected within seven years were not to be let, and that unfinished buildings on new foundations were to be pulled down. In spite of these restrictions London continued to grow. In 1568 a conduit was constructed at Dowgate for the purpose of obtaining water from the Thames, and in 1580 Peter Moris, an ingenious Dutchman, brought his scheme for raising the Thames water high enough to supply the upper parts of the city under the notice of the lord mayor and aldermen, and in order to show its feasibility he threw a jet of water over the steeple of St. Magnus's Church (see page 834). The maps show us much that remains somewhat the same as it was, but also much that has greatly altered. St. Giles's was literally a village in the fields; Piccadilly was "the waye to Redinge," Oxford Street "the way to Uxbridge," Covent Garden an open field or garden, and Leicester Fields lammas land. Moorfields was drained and laid out in walks in Elizabeth's reign. At Spitalfields crowds used to congregate on Easter Monday and Tuesday to hear the Spital sermons preached from the pulpit cross. The ground was originally a Roman cemetery, and about the year 1576 bricks were largely made from the clayey earth, the recollection of which is kept alive in the name of Brick Lane. Citizens went to Holborn and Bloomsbury for change of air, and houses were there prepared for the reception of children, invalids, and convalescents. In the north were sprinkled the outlying villages of Islington, Hoxton, and Clerkenwell. The Strand was filled with noble mansions washed by the waters of the Thames, but the street, if street it could be called, was little used by pedestrians. Londoners frequented the river, which was their great highway. The banks were crowded with stairs for boats, and the watermen of that day answered to the chairmen of a later date and the cabmen of to-day. When Shakespeare and his companions went to act at the Globe Theatre they did not cross London Bridge, but took boat at Blackfriars Stairs, and were landed opposite at the Paris Garden Stairs on the Bankside. The Bankside was of old a favorite place for entertainments, but two only—the bull-baiting and the bear-baiting—were in existence when Aggas's map was first planned. On Norden's map,[1] however, we find the gardens of Paris Garden, the bearhouse, and the playhouse.

The settled character of the later years of Elizabeth's reign appears to have caused a considerable change in the habits of the people. Many of the chief citizens followed the example of the courtiers, and built for themselves country residences in Middlesex, Essex, and Surrey; thus we learn from Norden that Alderman Roe lived at Muswell Hill, and we know that Sir Thomas Gresham built a fine house and planned a beautiful park at Osterley.

STUART (1603-1714).—The Stuart Period, from the accession of James I. to the death of Queen Anne, extends over little more than a century, and yet greater changes occurred during those years than at any previous period. The early years of Stuart London may be said to be closely linked with the last years of Elizabethan London, for the greatest men such as Raleigh, Shakespeare, and Ben Jonson lived on into James's reign. Much of the life of the time was then in the City, but the last years of Stuart London take us to the 18th century, when social life had permanently shifted to the west end. In the middle of the period occurred the civil wars and then the fire which changed the whole aspect of London. When James came to the throne the term suburbs had a bad name, as all those disreputable persons who could find no shelter in the city itself settled in these outlying districts. Then the line of the Strand was almost the only respectable outskirt. Stubbs denounced suburban gardens and garden houses in his *Anatomy of Abuses*, and another writer observed "how happy were the cities if they had no suburbs."

The preparations for the coronation of King James were interrupted by a severe visitation of the plague, which killed off as many as 30,578 persons, and it was not till March 15, 1604, that the king, the queen, and Prince Henry passed triumphantly from the Tower to Westminster. The lord mayor's shows, which had been discontinued for some years, were revived by order of the king in 1609. The dissolved monastery of the Charterhouse, which had been bought and sold by the courtiers several times, was obtained from Thomas, earl of Suffolk, by Thomas Sutton for £13,000. The new hospital chapel and schoolhouse were commenced in 1611, and in the same year Sutton died. Somerset House was occupied by Anne of Denmark, and in 1616 James I. commanded it to be called Denmark House. In 1619 Inigo Jones commenced the Banqueting House at Whitehall, which was only part of a proposed vast palace, but which has remained to our time to be one of the chief ornaments of the town. The fatal vespers at Blackfriars threw a gloom over the year 1623. A large and mixed congregation of Protestants and Roman Catholics had gathered together one Sunday evening at the house of Count de Tillier, the French ambassador, to hear Father Drury (a converted Protestant) preach. As many as were able crowded into the room on the upper floor for that purpose, but those who could not get in were fain to remain on the floor below and listen to a preacher on the sacrament of penance. The floors both gave way, and a large number of persons were precipitated to a great depth and killed, both preachers being among the dead. With the death of James I. in 1625 the older history of London may be said to have closed. During the reign of his successor the great change in the relative positions of London within and without the walls had commenced. Before going on to consider the chief incidents of this change it will be well to refer to some features of the social life of James's reign. Ben Jonson places one of the scenes of *Every Man in his Humor* in Moorfields, which at the time he wrote the play had lately been drained and laid out in walks. Beggars frequented the place, and travellers from the village of Hoxton, who crossed it in order to get into London, did so with as much expedition as possible. Adjoining Moorfields were Finsbury Fields, a favorite practising ground for the archers. Mile End, a common on the Great Eastern Road, was long famous as a rendezvous for the troops. These places are frequently referred to by the old dramatists; Justice Shallow boasts of his doings at Mile End Green when he was Dagonet in Arthur's show. Fleet Street was the show-place of London, in which were exhibited a constant succession of puppets, naked Indians, and strange fishes. The great meeting-place of Londoners in the day-time was the nave of old St. Paul's. Crowds of merchants with their hats on transacted business in the aisles, and used the font as a counter upon which to make their payments; lawyers received clients at their several pillars; and masterless serving-men waited to be engaged upon their own particular bench. Besides those who came on business there were gallants dressed in fashionable finery, so that it was worth the tailor's while to stand behind a pillar and fill his table-books with notes. The middle or Mediterranean aisle was the Paul's Walk, also called the Duke's Gallery from the erroneous supposition that the tomb of Sir Guy Beauchamp, earl of Warwick, was that of the "good" Humphrey, duke of Gloucester. After the Restoration a fence was erected on the inside of the great north door to hinder a concourse of rude people, and when the cathedral was being rebuilt Sir Christopher Wren made a strict order against any profanation of the sacred building. Another of the favorite haunts of the people was the garden of Gray's Inn, where the choicest society was to be met. There, under the shadow of the elm trees which Bacon had planted, Pepys and his wife constantly walked. Mrs. Pepys went on one occasion specially to observe the fashions of the ladies because she was then "making some clothes."

In those days of public conviviality, and for many years afterwards, the taverns of London held a very important place. The Boar's Head in Great Eastcheap was an inn of Shakespeare's own day, and the characters he introduces into his plays are really his own contemporaries. The "Mermaid" is sometimes described as in Bread Street, and at other times in Friday Street and also in Cheapside. We are thus able to fix its exact position; for a little to the west of Bow church is Bread Street, then came a block of

[1] This map of London by Norden is dated 1593, as stated above. The same topographer published in his *Middlesex* a map of Westminster as well as this one of the City of London.

houses, then Friday Street. It was in this block that the "Mermaid" was situated, and there appear to have been entrances from each street. What makes this fact still more certain is the circumstance that a haberdasher in Cheapside living "'twixt Wood Street and Milk Street," two streets on the north side opposite Bread and Friday Streets, described himself as "over against the Mermaid tavern in Cheapside." The Windmill tavern occupies a prominent position in the action of *Every Man in his Humor*.[1] The Windmill stood at the corner of the old Jewry towards Lothbury, and the Mitre close by the Mermaid in Bread Street. The Mitre in Fleet Street, so intimately associated with Dr. Johnson, also existed at this time. It is mentioned in a comedy entitled *Ram Alley* (1611), and Lilly the astrologer frequented it in 1640. At the Mermaid Ben Jonson may be supposed to have had such rivals as Shakespeare, Raleigh, Beaumont, Fletcher, Carew, Donne, Cotton, and Selden, but at the Devil in Fleet Street, where he started the Apollo Club, he was omnipotent. Herrick, in his well-known *Ode to Ben*, mentions several of the inns of the day.

Under James I. the theatre, which established itself so firmly in the latter years of Elizabeth, had still further increased its influence, and to the entertainments given at the many playhouses may be added the masques so expensively produced at court and at the inns of law. In 1613 "The Masque of Flowers" was presented by the members of Gray's Inn in the Old Banqueting House in honor of the marriage of the infamous Carr, earl of Somerset, and the equally infamous Lady Frances, daughter of the earl of Suffolk. The entertainment was prepared by Sir Francis Bacon at a cost of about £2000.

Charles I. and his councillors were filled with the same fear of the increasing growth of London which showed itself in the prohibitory proclamations of his two predecessors. In 1630 a proclamation was issued in which "the erection of any building upon a new foundation, within the limits of 3 miles from any of the gates of the City of London, or palace of Westminster," was forbidden. The privy council in the following year put this question to the lord mayor—"What number of mouths are esteemed to be in the City of London and the liberty?"—the answer to which was 130,268. These prohibitions were not allowed to remain a dead letter, and in 1632 Mr. Palmer, a large landholder in Sussex, was fined by the Star Chamber in the sum of £1000 for living in London beyond the period prescribed in the proclamation of June 20th of that year. In April, 1635, information was filed against Sir John Suckling the poet and others in the Court of Star Chamber for continuing to reside in London and Westminster. It was during this reign that the first great exodus of the wealthy and fashionable was made to the West End. The great square or piazza of Covent Garden was formed from the designs of Inigo Jones about 1632. The neighboring streets were shortly afterwards built, and the names of Henrietta, Charles, James, King, and York Streets were given after members of the royal family. Great Queen Street, Lincoln's Inn Fields, was built about 1629, and named in honor of Henrietta Maria. Lincoln's Inn Fields had been planned some years before.

When the civil war broke out London took the side of the parliament, and an extensive system of fortification was at once projected to protect the town against the threatened attack of the royal army. A strong earthen rampart, flanked with bastions and redoubts, surrounded the City, its liberties, Westminster and Southwark, making an immense enclosure. Mount Street, Grosvenor Square, marks the spot of one of these fortifications called Oliver's Mount. In 1650 Cromwell allowed the Jews to return to England after a banishment of centuries, and those who settled in London mostly chose the neighborhood of Aldgate as a place of residence. With the Restoration the separation of fashionable from city life became complete, and the West End grew into a formidable rival of the older London. In 1635 the game of pall mall was played in St. James's Fields, on the site of St. James's Square and Pall Mall, but during the Commonwealth this was discontinued, and some houses were built round about. The square was planned out in 1663, and it soon became the most fashionable place in London. A mall was then prepared in St. James's Park which still retains its name. About the same time the great houses in Piccadilly were built. Clarendon, Berkeley, and Burlington houses all appeared on the north side of that street about 1665.

London had been ravaged by plague on many former occasions but the pestilence that commenced in December, 1664, will ever live in history as "the Plague of London." On the 7th of June, 1665, Samuel Pepys for the first time saw two or three houses marked with the red cross and the words "Lord, have mercy upon us," on the doors. The deaths daily increased, and business was stopped. Grass grew in the area of the Royal Exchange at Whitehall, and in the principal streets of the city. On the 4th of September, 1665, Pepys writes an interesting letter to Lady Carteret from Woolwich:—"I have stayed in the city till above 7400 died in one week, and of them about 6000 of the plague, and little noise heard day or night but tolling of bells." . . . The plague was scarcely stayed before the whole city was in flames, a calamity of the first magnitude, but one which in the end caused much good, as the seeds of disease were destroyed, and London has never since been visited by such an epidemic. On the 2d of September, 1666, the fire broke out at one o'clock in the morning at a house in Pudding Lane. A violent east wind fomented the flames, which raged with fury during the whole of Monday and great part of Tuesday. On Tuesday night the wind fell somewhat, and on Wednesday the fire slackened. On Thursday it was extinguished, but on the evening of that day the flames again burst forth at the Temple. Some houses were at once blown up by gunpowder, and thus the fire was finally mastered. Many interesting details of the fire are given in Pepys's *Diary*. The distress of those who were made houseless by this calamity was great. The river swarmed with vessels filled with persons carrying away such of their goods as they were able to save. Some fled to the hills of Hampstead and Highgate, but Moorfields was the chief resort of the houseless Londoner. Soon paved streets and two-story houses were seen in that swampy place. The people bore their troubles heroically, and Henry Oldenburg, writing to the Hon. Robert Boyle on September 10, says, "the citizens, instead of complaining, discoursed almost of nothing but of a survey for rebuilding the city with bricks and large streets." Within a few days of the fire three several plans were presented to the king for the rebuilding of the city, by Christopher Wren, John Evelyn, and Robert Hooke. Wren proposed to build main thoroughfares north and south, and east and west, to insulate all the churches in conspicuous positions, to form the most public places into large piazzas, to unite the halls of the twelve chief companies into one regular square annexed to Guildhall, and to make a fine quay on the bank of the river from Blackfriars to the Tower. His streets were to be of three magnitudes—90 feet, 60 feet, and 30 feet wide respectively. Evelyn's plan differed from Wren's chiefly in proposing a street from the church of St. Dunstan's in the East to the cathedral, and in having no quay or terrace along the river In spite of the best advice, however, the jealousies of the citizens prevented any systematic design from being carried out, and in consequence the old lines were in almost every case retained. But, though the plans of Wren and Hooke were not adopted, it was to these two fellows of the Royal Society that the labor of rebuilding London was committed. Wren's great work, which has covered his name with renown, was the erection of the cathedral of St. Paul's, and the many churches ranged round it as satellites. Hooke's task was the humbler one of arranging as city surveyor for the building of the houses. He laid out the ground of the several proprietors in the rebuilding of the city, and had no rest early or late from persons soliciting him to set out their ground for them at once. The first great impetus of change in the configuration of London was given by the great fire, and Evelyn records and regrets that the town in his time had grown almost as large again as it was within his own memory. Although for several centuries attempts had been made in favor of building houses with brick or stone, yet the carpenters continued to be the chief house-builders. As late as the year 1650 the Carpenters' Company drew up a memorial in which they "gave their reasons that tymber buildings were more commodious for this citie than brick buildings were." The Act of Parliament "for rebuilding the city of London," passed after the great fire, gave the *coup de grace* to the carpenters as house-builders. After setting forth that "building with brick was not only more comely and durable, but also more safe against future perils of fire," it was enacted "that all the outsides of all buildings in and about the city should be made of brick or stone, except doorcases and window frames, and other parts of the first story to the front between the piers," for which substantial oaken timber might be used "for conveniency of shops." A third severe blow in addition to the plague and the fire overtook London in the reign of Charles II. The king and his brother had long entertained designs against the liberties of the city, and for the purpose of crushing them two pretexts were set up—(1) that a new rate of market tolls had been levied by virtue of an act of common council, and (2)

[1] Various changes in the names of the taverns are made in the folio edition of this play (1616) from the quarto (1601); thus the Mermaid of the quarto becomes the Windmill in the folio, and the Mitre of the quarto is the Star of the folio.

that a petition to the king, in which it was alleged that by the prorogation of parliament public justice had been interrupted, had been printed by order of the Court of Common Council. Charles directed a writ *quo warranto* against the corporation of London in 1683, and the Court of King's Bench declared its charter forfeited. Soon afterwards all the obnoxious aldermen were displaced and others appointed in their room by royal commission. A new lord mayor and recorder and new sheriffs were appointed in the same manner. This decision of the Court of King's Bench was reversed in 1690. In the winter of 1683–84 a fair was held for some time upon the Thames. The frost, which commenced about seven weeks before Christmas and continued for six weeks after, was the greatest on record; the ice was 11 inches thick.

The revocation of the edict of Nantes in October, 1685, and the consequent migration of a large number of industrious French Protestants, caused a considerable growth in the east end of London. The silk manufactories at Spitalfields were then established.

During the short reign of James II. the fortunes of the city were at their lowest, and nowhere was the arrival of the prince of Orange more welcomed. One of the first acts of James was to cause an indictment for high treason to be prepared against Alderman Cornish, who had been a zealous supporter of the Exclusion Bill. Sir John Eyles, who had never been sheriff nor was even a freeman of the city, was appointed lord mayor by the king in 1688 in succession to Sir John Shorter. When James found the danger of his position, and learned that William had landed, he sent for the mayor and aldermen and informed them of his determination to restore the city charter and privileges.

William III. cared little for London, the smoke of which gave him asthma, and when a great part of Whitehall was

London in 1720. Reduced Facsimile of Map by J. Senex.

burnt in 1691 he purchased Nottingham House and made it into Kensington Palace. For convenience of communication with London he had a broad road made through Hyde Park, which was lighted by lanterns at night. Kensington was then an insignificant village, but the arrival of the court soon caused it to grow in importance.

Although the spiritual wants of the city were amply provided for by the churches built by Sir Christopher Wren, the large districts outside the City and its liberties had been greatly neglected. The Act passed in the reign of Queen Anne for building fifty new churches (1710) not only helped to supply this want, but also gave a special architectural character to the suburbs.

EIGHTEENTH CENTURY.—With the accession of George I. a considerable change in the habits of all classes was introduced. At no previous time probably was public taste so low or manners more depraved. These two evils naturally were felt over the whole kingdom, but nowhere was their baneful influence more apparent than in the capital. Public buildings of the most tasteless character were raised, and streets of private houses were built that were positively painful in their ugliness. London thus grew to be the ugliest of cities, a character which it is only now beginning to throw off. London had gradually grown up by the side of the Thames and extended itself along the river's banks, which were skirted by a succession of handsome palaces. The inhabitants moved from place to place in boats, and the river was the chief highway. In the 18th century this state of things had ceased, and other parts of the town were more largely built upon. The inhabitants used coaches and chairs more than boats, and the banks of the river were neglected. London could no longer be seen as a whole, and it grew into a mere collection of houses. In spite of all this the 18th century produced some of the most devoted of Londoners,—men who considered a day lived out of London as one lost out of their lives. Of this class Dr. Johnson and Hogarth are striking examples. The exhibitions of vice and cruelty that were constantly to be seen in the capital have been reproduced by Hogarth, and had they not been set down by so truthful an observer it would have been almost impossible to believe that such enormities could have been committed in the streets of a great city. A few days after his accession George I. addressed the representatives of the city in these words—"I have lately been made sensible of what consequence the city of London is, and therefore shall be sure to take all their privileges and interests into my particular protection." On the following lord mayor's day the king witnessed the show in Cheapside and attended the banquet at Guildhall. Queen Anne and the first three Georges were all accommodated, on the occasions of their visits to the City to see the show, at the same house opposite Bow church. In the time of Queen Anne and George I. David Barclay (the son of the famous apologist for the Quakers) was an apprentice in the house, but he subsequently became master, and had the honor of receiving George II. and George III. as his guests. There was a large balcony extending along the front of the house which was fitted with a canopy and hangings of crimson damask silk. The building, then numbered 108 Cheapside, was pulled down in 1861. In September, 1720, the bursting of the South Sea Bubble created the most fearful panic that London has ever seen. Trade was at a standstill, and many of the chief merchants, goldsmiths, and bankers stopped payment, thus causing ruin to numberless families.

Early in the 18th century there was a considerable ex-

tension of building operations in the West End. About the year 1716 the earl of Burlington commenced building on the Ten Acres Field at the back of the gardens of Burlington House, and shortly afterwards the City authorities, who were proprietors of the Conduit Mead (containing 27 acres), followed his example. On June 1, 1717, the *Weekly Journal* announced that "the new buildings between Bond Street and Mary-le-Bone go on with all possible diligence, and the houses even let and sell before they are built." The parish of St. George's, Hanover Square, was constituted in 1725. In 1715 Cavendish Square and the neighboring streets had been planned out, but it was several years before the plan was completed. The foundation stone of Harcourt House (duke of Portland's) on the west side of the square, which is now about to be destroyed, was laid in 1722; and the north side, which was originally intended to be occupied by the mansion of the duke of Chandos, was still unfinished in 1761. St. Peter's chapel in Vere Street, originally Oxford chapel, was built by Gibbs about 1724.

Still, however, the north of London remained unbuilt upon, and the open character of this part is well shown in the map given above. In 1756 and for some years subsequently the land behind Montague House (now the British Museum) was occupied as a farm, and when in that year a proposal was made to plan out a new road the tenant and the duke of Bedford strongly opposed it. In 1772 all beyond Portland Chapel in Great Portland Street was country. Portman Square was laid out about 1764, but it was nearly twenty years before the whole was finished. It was built on high ground with an open prospect to the north, which gave it a name as a peculiarly healthy part of London. Mrs. Montagu called it the Montpellier of England, and said she "never enjoyed such health as since she came to live in it." In a map of London dated 1773 the villages of Hackney, Stepney, Islington, Hoxton, Paneras, Marylebone, Paddington, Knightsbridge, and Chelsea are all shown as country outskirts of the town. Bedford House in Bloomsbury Square had its full view of Hampstead and Highgate from the back, and Queen's Square was built open to the north in order that the inhabitants might obtain the same prospect. Dr. Heberden recommended South Lambeth as a health resort on account of its situation on the banks of a tidal river with the south-west wind blowing fresh from the country and the north-east softened by blowing over the town.

In 1737 the Fleet ditch between Holborn Bridge and Fleet Bridge was covered over, and Stocks market was removed from the site of the Mansion House to the present Farringdon Street, and called Fleet market. On October 25, 1739, the first stone of the Mansion House was laid. Previously the first magistrates lived in several different houses. In 1750 Westminster Bridge was opened for passengers, and London Bridge ceased to be the only means of crossing the Thames at London. Blackfriars Bridge followed in 1769. A frost almost as severe as the memorable one of 1683–84 occurred in the winter of 1739–40, and the Thames was again the scene of a busy fair. In 1758 the houses on London Bridge were cleared away, and in 1760–62 several of the city gates were taken down and sold. Moorgate is said to have fetched £166, Aldersgate £91, Aldgate £177, Cripplegate £90, and Ludgate £148. The statue of Queen Elizabeth which stood on the west side of Ludgate was purchased by Alderman Gosling and set up against the east end of St. Dunstan's church in Fleet Street, where it still remains.

The need of improving and opening out many of the streets of London was felt in the 18th century, but little or nothing was done, and the work was left to be accomplished in the present century. John Gwynn, a friend of Dr. Johnson, paid considerable attention to this subject, and published in 1766 a work entitled *London and Westminster Improved, Illustrated by Plans.* Many of the author's suggestions have not been carried out, although they would often have been improvements upon what has been since attempted. Of such alterations as have subsequently been executed we may note here the widening of Swallow Street, a much-needed improvement, which was not carried out until the beginning of the present century, a square where Trafalgar Square now stands and some straight streets on the site of Durham House now the Adelphi, and a bridge where Waterloo Bridge was afterwards built.

Robert Adam and his brothers, Scotsmen who came to London under the protection of the earl of Bute, made a considerable improvement in the appearance of certain parts of London during the second half of the 18th century by the adoption of a combined system of architecture, in which several separate houses were grouped together to give the appearance of a continuous building. The Adelphi and Portland Place still remain good examples of their system. The brothers Adam were leaders in the revival of taste, and the interiors of their buildings are executed with much elegant detail. We have now come to a period when London outside the City may be considered as more important in many points than London within the liberties. "Why, sir," said Dr. Johnson to Boswell, "Fleet Street has a very animated appearance, but I think the tide of human existence is at Charing Cross." This speech was made in 1775, and in spite of the vast increase of London in every direction Charing Cross still retains this pre-eminent position.

The latter years of the 18th century were somewhat troublous ones for London, but it is only necessary here to barely mention the divisions between the court and the City relating to the election of Wilkes, and the Gordon riots of 1780, when the gates of Newgate were thrown open, and much property was destroyed by the mob.

NINETEENTH CENTURY.—It is impossible to give here anything like a full account of the history of London during the 19th century. Since 1800 the City itself has been almost entirely rebuilt, and the suburbs on all sides have been vastly extended. Russell Square was built about 1804, and the district north of Bloomsbury was laid out at the same time. Bloomsbury Square had been built in 1665, and Bedford Square at the end of the 18th century. Alexander Gibson Hunter, in a letter to Constable the publisher written in March, 1807, says, "Young Faulder and I walked over all the duke of Bedford's new feuing grounds, Russell Square, Tavistock Place, Brunswick Square, etc. The extent of them, and the rapidity of the buildings, is beyond all comprehension." Bedford and Russell Squares were for some years the favored place of residence for the judges. To show how late has been the growth north of the New Road we may mention that at the beginning of the century grapes were ripened by the sun in the open air in gardens in Gower Street, and twenty-five dozen of nectarines were gathered in 1800 from three completely exposed trees in a garden in Upper Gower Street. Still later the richest flavored celery was gathered in abundance in the same place. When duelling was in fashion the duellists naturally chose out the most unfrequented places, and we thus obtain an idea where these places were situated. Chalk Farm for some years rivalled in popularity Wimbledon Common, where the duke of York fought Colonel Lennox in 1789, Battersea Fields, where the duke of Wellington fought the earl of Winchelsea in 1829, and Putney Heath, where Pitt met Tierney in 1798, and Castlereagh and Canning fought in 1809. As late as 1843 a duel was fought at Chalk Farm between Lieutenant Monroe and Colonel Fawcett, when the latter was killed.

In 1806 London saw the public funerals of three of England's greatest men. On the 8th February the body of Nelson was borne with great pomp from the Admiralty to St. Paul's Cathedral, where it was interred in the presence of the prince of Wales and the royal dukes. Pitt was buried on 22d February, and Fox on the 10th October, both in Westminster Abbey.

The first exhibition of Windsor's system of lighting the streets with gas took place on the king's birthday (June 4) 1807, and was made in a row of lamps in front of the colonnade before Carlton House. Finsbury Square was the first public place in which gas lighting was actually adopted, and Grosvenor Square the last. On October 11, 1811, the first stone of Waterloo Bridge was laid, and on June 18, 1817, it was publicly opened. Southwark Bridge, was opened in April, 1819, and new London Bridge, the first stone of which had been laid on June 15, 1825, on August 1, 1831. Westminster and Blackfriars Bridges have been rebuilt within the last few years, and thus not one of the London bridges dates back farther than the present century. One of the greatest improvements in the West End was the formation of Regent Street, intended as a communication between Carlton House and the Regent's Park, which had been planned in 1812. An Act of Parliament was obtained in 1813 for the purpose of carrying out Nash's design. In the winter of 1813–14 the Thames was again frozen over. The frost commenced on the evening of December 27, 1813, with a thick fog. After it had lasted for a month, a thaw of four days, from the 26th to the 29th of January, took place, but this thaw was succeeded by a renewal of the frost, so severe that the river soon became one immovable sheet of ice. There was a street of tents called the City Road, which was daily thronged with visitors. The fashionable Belgravia was built about 1825, over the squalid Five Fields, long known as a dangerous district. Belgrave Square was commenced in 1825, and Eaton Square was set out in 1827, but not wholly completed until 1853. It was about 1829, soon after Carlton House was pulled down, that the line of palatial club-houses in Pall Mall was commenced. In 1827 the Turnpike Act came into operation, and twenty-seven turnpikes were removed in

one day. In 1838 the second Royal Exchange was destroyed by fire; and on October 28, 1844, the Queen opened the new Royal Exchange, which was built by Mr. (afterwards Sir William) Tite. On April 27, 1840. the first stone of the new Houses of Parliament to be erected by Charles Barry was laid on the site of the old buildings which had been burnt in October, 1834. An Act of Parliament was passed in 1847 for the purpose of widening and lengthening Cannon Street, and subsequently the street was extended to St. Paul's Churchyard. In 1848 London was in danger from the threatened attack of the Chartists, and defensive preparations were extensively arranged. On the 10th of April, the mob having met on Kennington Common, was prevented from returning to London over the bridges, and no more was heard of any rising. The Great Exhibition of 1851 brought a larger number of visitors to London than had ever been in it before at one time. In 1852 the duke of Wellington's lying in state at Chelsea Hospital, and his public funeral at St. Paul's, were two of the grandest London sights of the present century. On the occasion of the marriage of the Prince of Wales, the streets of London were illuminated as they never had been before. In 1864 Queen Victoria Street, a new thoroughfare from Blackfriars Bridge to the Mansion House, was begun, and in 1870 the northern shore of the river was embanked. The erection of the Thames Embankment, which was carried out at great expense, has shown itself to be the greatest improvement ever made in London. The river, which had been too long neglected, was again raised to its natural position as the chief ornament of London as well as the cause of its prosperity.

Perhaps the most distinguishing characteristic of London life in the latter half of the 19th century is the rush of Londoners which takes place each day after business hours from the centre of the town to the outskirts. This daily exodus has been chiefly caused by the facilities offered by the various railway companies. The first emigration of the London merchants westward was about the middle of last century, but only those who had already secured large fortunes and possessed the highest reputations ventured as far as Hatton Garden. At the beginning of the present century it had become common for the tradesmen of the City to live away from their business, but it was only about thirty years ago that it became at all usual for those in the West End to do the same.

One point worthy of special mention in connection with the modern growth of London is the larger use of stone in building than at any previous period. The reason of this is that the increase in the value of land has made it worth the builder's while to spend more money on the building he raises. We might parody the remark on Augustus's influence in Rome and say—the 19th century found London brick and will leave it stone.

Literature.—The books written upon London are so numerous that they would form a library by themselves; it is impossible here to do more than indicate some of the most important. The earliest description of London is that written by Fitzstephen, in the reign of Henry II., but first printed with Stow's *Survey*, in 1598. Arnold's *Chronicle, or the Customs of London*, was first published in 1502. The first history was *A Survey of London*, by John Stow, 1598, 1603. The author died in 1605, and his work was continued by Anthony Munday and others (1618, 1633), and in the next century by J. Strype (1720, 2 vols. fol.; 1754–55, 2 vols. fol.). This last edition remains the standard history, and the remarks of Strype are very often quoted as those of Stow. E. Hatton's *New View of London* (1708) is very useful on account of its alphabetical list of streets, etc. Maitland's *History of London* was first published in 1 vol. folio in 1739, and was republished in 1756, 1760, 1769, and 1775—each edition in 2 vols. folio, the last being edited by the Rev. J. Entick. Entick had himself published previously *A History and Survey of London*, etc., 1766. *A New and Complete History and Survey of the Cities of London and Westminster*, etc., by a society of gentlemen, revised by H. Chamberlain, appeared in 1770, and again, revised by W. Thornton, etc., in 1784; *A New History of London*, by J. Noorthouck, in 1773; and *A New and Universal History, etc., of London and Westminster*, etc., in 1775, fol. The first edition of Pennant's *London*, the most popular book ever written upon the subject, appeared in 1790. It has been frequently reprinted, and an index to the 4th edition was compiled by T. Downes, and published in 1814. A German translation was published at Nuremberg in 1791. *Antiquities of London and its Environs*, by John T. Smith, appeared in 1791–1800. Smith also published *Antiquities of the City of Westminster*, 1807, new edition, 1837, 4to; *Ancient Topography of London*, 1815; *Vagabondiana*, 1815–17; *Cries of London*, 1839; and *Antiquarian Rambles in the Streets of London*, edited by C. Mackay, 1846. Other works are J. P. Malcolm's *Londinium Redivivum, or an Ancient History and Modern Description of London*, 1803–7; *Anecdotes of the Manners and Customs of London during the 18th Century*, 1808, 1810; and *Anecdotes from the Roman Invasion to 1700*, 1811; David Hughson's [E. Pugh's] *London*, 1806–9, and *Walks through London*, 1817; B. Lambert's *History and Survey of London*, 1806; *Microcosm of London*, 1808–9; H. Hunter's *History of London*, 1811, 4to; *Beauties of England and Wales*, 1814–16, vol. x., "London and Middlesex;" R. Wilkinson's *Londina Illustrata*, 1819; Thomas Allen's *History and Antiquities of London, Westminster, and Southwark*, 1827–29, a most valuable work, with much information not to be found elsewhere; and E. W. Brayley's *Londiniana*, 1829. *London* (edited by Charles Knight, 1841–44; revised by E. Walford, 1875–77) contains articles of considerable interest, but these are badly arranged, and the whole work is incomplete. Leigh Hunt's *The Town* (1848; new ed., 1859) is an interesting work, but without original research. *A Handbook for London* (by Peter Cunningham, 1849; new ed., 1850) is an indispensable work of the highest value; a new edition has been promised by Mr. Murray for many years. The various works on London by J. H. Jesse and John Timbs are interesting, but wanting in accuracy. *The Curiosities of London* by the latter is of value. Cassell's *Old and New London* (1873–78, in 6 vols. 8vo; vols. i.–ii. by Walter Thornbury, vols. iii.–vi. by E. Walford) is of special value on account of the illustrations, many of them copied from Mr. Crace's collection. Dickens's *Dictionary of London* is a useful handbook for London as it is. Besides these general works there are several *Chronicles of London* at various periods, some of which have been published by the Camden Society. The *Transactions of the London and Middlesex Archæological Society* contain papers on various places in London. Newcourt's *Repertorium Ecclesiasticum Parochiale Londinense* (1708–10) still contains the best history of the parishes of London. On Roman remains the chief works are *An Account of some Roman Urns digged up near Bishopsgate*, by J. Woodward, 1713; and *Illustrations of Roman London*, by C. Roach Smith, 1859.

The best books on the environs as a whole are D. Lyson's *Environs of London* 1792–96; *Parishes in Middlesex not included in the Environs*, 1800; James Thorne's *Handbook to the Environs of London*, 1876; and W. Howitt's *The Northern Heights of London*, 1869.

The titles of the leading works on special subjects are subjoined under the several heads:—CHARITIES.—A. Highmore, *Pietas Londinensis—History of Public Charities in London*, 1814; and Herbert Fry, *Royal Guide to the London Charities* (annual). CHURCHES.—*The Churches of London*, by George Godwin, assisted by J. Britton, 1839: and *Guide to the Churches of London and its Suburbs*, by Charles Mackeson (annual). CLIMATE.—Luke Howard, *The Climate of London*, 1818–20; 2d ed., 1833. COMPANIES.—William Herbert, *History of the Twelve Great Livery Companies of London*, 1837. Separate Histories have been also written of the following companies:—Artillery (Highmore, 1804; Raikes, 1878); Carpenters' (Jupp, 1848); Coopers' (Firth, 1848); Founders' (Williams, 1867); Grocers' (J. B. Heath, 1829, 1854); Ironmongers' (Nicholl, 1866); Leathersellers' (Black, 1871); Merchant Taylors' (Clode, 1875); INNS OF COURT.—William Herbert, *Antiquities of the Inns of Court and Chancery*, 1804. MUNICIPALITY.—J. F. B. Firth, *Municipal London*, 1876, 8vo. PARKS.—Jacob Larwood, *The Story of the London Parks*, 1872. POLICE.—Patrick Colquhoun, *Treatise on the Police of the Metropolis*, 1796; 8th ed., 1806. POOR.—H. Mayhew, *London Labor and the London Poor*, 1851; Greenwood, *The Wilds of London*, 1874. POPULATION.—Graunt's *Observations on the Bills of Mortality*, 1876. PRISONS.—Hepworth Dixon, *London Prisons*, 1851. THEATRES.—E. W. Brayley, *Historical and Descriptive Accounts of the Theatres of London*, 1826. WATER.—W. Matthews, *Historical Account of the Waterworks of London*, 1835; J. Prestwich, *Geological Inquiry respecting the Water-bearing Strata of the Country round London*, 1851.

There is no complete catalogue of books relating to London, but useful lists will be found in Anderson's *Book of British Topography*, 1881, and in Lowndes's *Bibliographer's Manual*, 1860. (H. B. W.)

LONDON, a city and port of entry in the Dominion of Canada, the chief town of the county of Middlesex, Ontario, and the see both of a Roman Catholic bishop and of the Anglican bishop of Huron, lies 25 miles north of Lake Erie and 32 miles south-east of Lake Huron, in the midst of a fine agricultural country in the angle made by the confluence of the two branches of the Thames. It is a station on the main line of the Great Western Railway, and the terminus of a branch of the Grand Trunk Railway from St. Mary's, a line from Port Stanley on Lake Erie, and the London, Huron, and Bruce Railway. The local nomenclature of London is in great measure a reproduction of that of the great city whose name it has ambitiously borrowed; the Thames is again spanned by a Westminster and a Blackfriars Bridge, and it has a Hyde Park, a Covent Garden Market, a Crystal Palace, a Tower of London (its jail and court-house), a St. Paul's Cathedral, with Pall Mall, Piccadilly, Cheapside, etc. Among the more important buildings are the city-hall, the court-houses, the city hospital, the lunatic asylum, the orphan asylum, the Roman Catholic convent. The educational institutions include the Collegiate Institute, Hellmuth Ladies' College, the Academy of the Sacred Heart, and the newly-founded Western University. The chief industry is oil-refining—the crude oil being brought from Enniskillen Wells, a distance of 40 miles. There are also railway-car works, boiler and stove and other iron works, and chemical works; and furniture, farming implements, carriages and wagons are manufactured on an

extensive scale. The value of the imports has increased from £176,400 in 1861 to £522,391 in 1881; and the value of the exports from £76,000 to £131,141. Three daily and five weekly newspapers and three monthly periodicals issue from the local press. The city is divided into seven wards, and is governed by a mayor and aldermen. First laid out in 1825–6, it returned a member in 1836, and was incorporated in 1840. The population was 15,826 in 1871, and 19,746 in 1881; but the East, West, and South London suburbs—really part of the city, though not yet included within the municipal boundaries— had a population of upwards of 37,983 in 1901.

LONDONDERRY, a maritime county in the province of Ulster, Ireland, is bounded on the N. by the Atlantic, on the W. by Lough Foyle and Donegal, on the E. by Antrim and Lough Neagh, and on the S. by Tyrone. It has an irregular oval form, its greatest length being about 50 miles, and its greatest breadth about 40. The area comprises 513,388 acres, or about 802 square miles. The county consists chiefly of river valleys surrounded by elevated table-lands rising occasionally into mountains, while on the borders of the sea-coast the surface is generally level. The principal river is the Roe, which flows northward from the borders of Tyrone into Lough Foyle below Newtown-Limavady, and divides the county into two unequal parts. Further west the Faughan also falls into Lough Foyle, and the river Foyle passes through a small portion of the county near its north-western boundary. In the south-east the Moyola falls into Lough Neagh, and the Lower Bann from Lough Neagh forms for some distance its eastern boundary with Antrim. The only lake in the county is Lough Finn on the borders of Tyrone, but Lough Neagh, which is included in Antrim, forms for about 6 miles its south-eastern boundary. The valley of the Roe is a line of division between two entirely different geological structures. To the east there is a basaltic tract in all respects similar to that in Antrim, except that on the Londonderry side of the Bann the dip of the strata is reversed and lies north-east. At Benyevenagh, which has an elevation of 1262 feet, the basalt reaches a thickness of 900 feet. It is succeeded by chalk lias, limestone, and red sandstone, the whole resting on primitive rock. The remainder of the county consists chiefly of mica-slate and primitive limestone, and includes the mountain of Sawel, with an elevation of 2236 feet, as well as other eminences approaching 2000 feet in height. Hornblende and granite frequently emerge above the slate, and limestone is not uncommon. Sandstone crops to the surface throughout nearly the whole of the valley of the Roe. Fine rock crystals are found in Finglen, near Dungiven, and in several other districts. Iron was at one time worked at Slieve Gullion, and is obtained in abundance in the bogs. There are a few unimportant veins of copper and lead.

Agriculture.—The excessive rainfall and the cold and uncertain climate are unfavorable for agricultural operations, and except in the valleys the soil is unsuitable for tillage. In the basalt region large tracts are partially submerged, and the hard and firm portions consist chiefly of rock. Along the sea-coast there is an extensive district of red clay formed by the decomposition of sandstone, and near the mouth of the Roe there is an extensive tract of a marly nature. Along the valleys the soil is often very fertile, and the elevated districts of the clay-slate region afford rich pasture for sheep.

In 1880 181,239 acres were under tillage, 206,044 were pasture, 5305 plantation, and 120,451 waste. The total number of holdings in the same year was 17,351, of which 1377 were under 1 acre. More than half of the total number were included in those between 5 and 15 acres and those between 15 and 30 acres, which numbered 5467 and 4848 respectively. The preceding table shows the area under the principal crops in 1855 and 1881.

	Wheat.	Oats.	Other Cereals.	Potatoes.	Turnips.	Other Green Crops.	Flax.	Meadow and Clover.	Total.
1855	8,201	91,990	2,084	31,983	11,451	1,454	11,795	20,379	174,337
1881	1,817	74,680	3,102	34,437	12,491	3,390	18,939	38,062	186,918

The increase in the area under crops is due chiefly to the increase in that under flax and meadow, although there is an increase in all other crops except wheat and oats.

The number of horses since 1855 has increased very slightly—from 20,331 to 20,749, of which 17,053 were used for agricultural purposes. Cattle in 1855 numbered 102,185, and in 1881 only 96,693, an average of 25 to every 100 acres under cultivation, the average for Ireland being 25·8. The number of milch cows was 39,393. Sheep numbered 29,888 in 1855, and 30,161 in 1881, pigs in the same years numbering 22,828 and 23,946. Goats in 1881 numbered 4666, and poultry 368,436.

According to the latest return, the land in 1873 was divided amongst 2178 proprietors possessing 511,838 acres, with a total annual value of £364,732, the annual value per acre being 14s. 3d. Of the owners about 36 per cent. possessed less than 1 acre. As many as 153,419 acres were possessed by the Irish Society and seven of the livery companies of London—the Irish Society possessing 6075 acres; the Drapers' Company, 27,025; the Fishmongers', 20,509; the Grocers', 11,638; the Ironmongers', 12,714; the Mercers', 21,241; the Salters', 19,445; and the Skinners', 34,772. In addition to this Sir H. H. Bruce owned 20,801 acres, S. C. Bruce 13,651, the representatives of T. R. Richardson 18,159, Church Temporalities Commissioners 13,413, C. S. M'Causland 12,886, and J. B. Beresford 10,420.

Manufactures.—The staple manufacture of the county is linen. In 1880 the number of scutching mills was 185. The manufacture of coarse earthenware is also carried on, and there are large distilleries and breweries and some salt-works. There are important fisheries of salmon and eels on the Bann.

Railways.—The only railways in the county are those which skirt its northern and western boundary,—the Belfast and Northern Counties line passing by Cookstown and Coleraine to Londonderry, and another line connecting Londonderry with Enniskillen.

Administration and Population.—The county comprises 6 baronies, with 43 parishes and 1202 townlands. It is in the north-west circuit. Assizes are held at Londonderry, and quarter sessions at Coleraine, Londonderry, Magherafelt, and Limavady. Within the county there are 14 petty sessions districts. It includes two poor-law unions and portions of other three. Londonderry is in the Belfast military district and Omagh subdistrict. The county is represented in parliament by two members, and the boroughs of Londonderry (28,947) and Coleraine (6684) by one each. The population of the county, which in 1760 was only 46,182, had increased by 1821 to 193,869, and by 1841 to 222,461, but in 1851 had diminished to 192,269, in 1871 to 173,906, and in 1881 to 164,714, and in 1901 to 144,329. From the 1st of May, 1851, to 31st December, 1881, the number of emigrants was 73,725. For every 1000 of the population the death-rate in 1880 was 19.2, the marriage-rate 4.2, and the birth-rate 23.2.

History and Antiquities.—At an early period the county was inhabited by the O'Cathans, or O'Catrans, who were tributary to the O'Nials or O'Neils. Towards the close of the reign of Elizabeth the county was seized with the purpose of checking the power of the O'Neils, when it received the name of Coleraine, having that town for its capital. In 1609, after the confiscation of the estates of the O'Neils, the citizens of London obtained possession of the towns of Londonderry and Coleraine and adjoining lands, 60 acres out of every 1000 being assigned for church lands, and certain other portions to three native Irish gentlemen. The common council of London undertook to expend £20,000 on its reclamation, and elected a body of twenty-six for its management, who in 1613 were incorporated as the Irish Society, and retained possession of the towns of Londonderry and Coleraine, the remainder of the property being divided among twelve of the great livery companies of the city. Notwithstanding the expenditure of large sums by these companies in its management, their estates were afterwards sequestrated by James I., and in 1637 the charter of the Irish Society was cancelled. Cromwell restored the society to its former position, and Charles II. at the Restoration granted it a new charter, and confirmed the companies in the possession of their estates. In the insurrection of 1641 Moneymore was seized by the Irish, and Magherafelt and Bellaghy, then called Vintner's Town, burned, as well as other towns and villages. The most remarkable ancient ruin is that of the Cyclopean fortress of the Giant's Sconce or Ring, situated in the pass between Drumbo and Largentea, the interior of which, 600 feet in

diameter, is partly hollowed out of a knoll of basalt, by which it is enclosed on all sides except the north-east, where it is defended by a wall of great thickness, with access for only one person in a stooping posture. The most remarkable of the Druidical circles is that at Slacht Manus. There are a large number of artificial caves. The most ancient castle of Irish origin is that of Carrickreagh; and of the castles erected by the English those of Dungiven, Salterstown, and Muff are still in good preservation. The old abbey of Dungiven, founded in 1109, and standing on a rock about 200 feet above the river Roe, is a very picturesque ruin.

LONDONDERRY, or DERRY, a county of a city, parliamentary borough, and the chief town of the county of Londonderry, is situated on an eminence rising abruptly from the west side of the river Foyle to the height of about 120 feet, 4 miles from the junction of the river with Lough Foyle, and 80 miles north-north-west of Belfast. It is still surrounded by an ancient rampart about a mile in circumference and having seven gates, but the buildings now extend considerably beyond this boundary. The summit of the hill, which is at the centre of the town, is occupied by a quadrangular area from which the main streets, which for the most part are spacious, diverge at right angles. Some of the original houses with high pyramidal gables remain, but they have been much modernized. The river is crossed by an iron bridge 1200 feet in length. The cathedral in the Later English style, and consisting of nave and aisles separated by pointed arches, with tower and spire at the west end, was completed in 1633 at a cost of £4000, contributed by the city of London. The building is 240 feet in length with a breadth of 62 feet, and the height of the tower and spire is 228 feet. The spire was added in 1788, when the old tower was raised 21 feet, and in 1802 the spire was rebuilt. The bishop's palace, erected in 1716, occupies the site of the abbey founded by Columba. The abbot of this monastery, on being made bishop, erected in 1164 Temple More or the "Great Church," one of the finest buildings in Ireland previous to the Anglo-Norman invasion. The original abbey church was called the "Black Church," but both it and the "Great Church" were demolished in 1600, and their materials used in fortifying the city. There is a large Roman Catholic cathedral. The court-house was completed in 1824 at a cost of about £34,000. For the free grammar school, founded in 1617, a new building was erected in 1814 at a cost of over £14,000. There are a number of charitable foundations. The staple manufacture of the town is linen, and there are also shipbuilding yards, iron-foundries, saw-mills, manure-works, distilleries, breweries, and flour-mills. The salmon fishery on the Foyle is also very valuable. The river affords facilities for a secure and commodious harbor, its greatest depth being 33 feet, with a depth of 12 feet at low water. The port has a considerable coasting trade with Great Britain, exporting agricultural produce and provisions. For the last five years its imports have averaged over £600,000 (chiefly grain and provisions), and its exports, which vary very greatly, over £10,000. In 1880 the number of vessels that entered the port was 1569, with a total tonnage of 335,544, the number that cleared 1452, with a tonnage of 326,178. Londonderry returns one member to parliament. The population of the city, which in 1857 was 19,399, had increased in 1871 to 25,242, and in 1901 to 39,873.

Derry, the original name of Londonderry, is derived from *Doire*, the "place of oaks." It owes its origin to the monastery founded by Columba in 546. From the 9th to the 11th century the town was frequently in the possession of the Danes, and was often burned and devastated, but they were finally driven from it by Murtagh O'Brien about the beginning of the 12th century. In 1311 it was granted by Edward II. to Richard de Burgo. After the Irish Society of London obtained possession of it, it was in 1613 incorporated under the name of Londonderry. The fortifications, which were begun in 1600, were completed in 1618 at a cost of nearly £9000. Its charter was confirmed in 1662 by Charles II. From April 18, 1690, the Protestants of the north defended themselves within its walls against James II. until the siege was raised in the following August. See the *History* by Hempton (1861).

LONDONDERRY, ROBERT STEWART, SECOND MARQUIS OF (1769–1822), better known by his courtesy title of Viscount Castlereagh, which he held until the last year of his life, the statesman who brought about the union with Ireland, who was foreign minister for ten eventful years, who represented England at the congress of Vienna, and who was the recognized leader of the aristocratic and reactionary party which owed its being to the excesses of the French Revolution, was born on June 18, 1769, and was thus one year older than his great rival George Canning. His father, Robert Stewart of Ballylawn in the county of Londonderry, and Mount Stewart in Down, had represented the latter county in two Irish parliaments; and his marriage with Lady Sarah Seymour Conway, daughter of the earl of Hertford, in 1766, had brought him into connection with many of the great Whig families of England, as did also his second marriage with the eldest daughter of Lord Camden. His elder son, the future minister, was educated at a school in Armagh, and proceeded in 1786 to St. John's College, Cambridge. He spent only a single year at the English university, and was on his grand tour through Europe when he was summoned home by his father, who had just been created Lord Londonderry in the peerage of Ireland, to stand for the county of Down as the candidate of the smaller landholders against the influence of the marquis of Downshire. The election cost the new Lord Londonderry £60,000, a sum which crippled him for his whole life. But he was successful, and the young Stewart entered the Irish parliament as one of the few really independent members who sat there, bound by no ties to a great lord, but the representative of three thousand freeholders of the richest county of the most educated province of Ireland. He joined the opposition, like his father before him, and eagerly pressed for the extension of the franchise to the Roman Catholics, even going so far, said his enemies later, as to become a contributor to the *Northern Star* of Belfast, the organ of the seditious party in Ulster; but the great events of the French Revolution soon showed their influence on his opinions, as on those of most landed proprietors. His thoughts on politics already clearly pointed towards the necessity of a union between England and Ireland, a necessity by this time obvious to all political thinkers and practical politicians. But for the time he held firmly to the popular side, voting for the removal of Catholic disabilities, and the right of Irishmen to trade with India. At last, however, Lord Camden came over to Ireland, in March, 1795, as lord-lieutenant, with Mr. Pelham as his secretary, on a mission to tell the Catholics and reformers that they must expect no further relief and no further reform. He took much notice of his sister's step-son, young Robert Stewart, who was quite willing to be won over from the opposition, and who had in the previous year married Lady Emily Hobart, daughter of the late earl of Buckinghamshire, a near relative of many great political personages. Lord Camden used his influence to obtain for his brother-in-law a viscountcy as Viscount Castlereagh in October, 1795, and in the following August an earldom as earl of Londonderry. In that same August, 1796, he made Robert Stewart, who by his father's promotion had become Viscount Castlereagh, keeper of his signet, an honorary post which merely marked his accession to the Government, and in February, 1797, acting secretary in the place of Mr. Pelham. Taking office at a time when everything was at the height of confusion, Lord Castlereagh soon began to show his splendid administrative genius, which, indeed, consisted in his "infinite capacity for taking pains" and careful mastery of details. During the rebellion of 1798, when Lord Camden resigned in panic, Castlereagh showed all the qualities of a splendid minister of police, and heartily co-operated with the wise measures of Lord Cornwallis, by which the rebellion was soon brought to an end. He was equally use-

ful to Cornwallis in the second part of his mission to Ireland, namely, the union with England. The measure was to be carried; the means were bribery whether in honors or in money. The details of the passage of the measure through the House can be studied in the correspondences of Cornwallis and Castlereagh, in which appear clearly the utter disgust of Cornwallis at the work he was doing and the country he was in, and Castlereagh's pride in his successful manipulation of men. The Union carried (1800), then came the fulfilment of promises made to secure support or disarm opposition, and first in importance those to the Catholics. It was thoroughly understood between Pitt, Cornwallis, and Castlereagh that full rights of citizenship were to be given to the Catholics as a reward for the loyal behavior of the greater men during the rebellion, and to induce them not to oppose the Union. But the promise was not fulfilled. Pitt had indeed promised to carry the measure; but the king's conscience was worked upon by Lord Loughborough, and to Pitt's surprise and disgust his resignation was accepted, and immediately followed by that of the abler half of the cabinet, and necessarily of Cornwallis and Castlereagh. With his resignation ends the first epoch of Castlereagh's political life. On very many occasions in his correspondence Cornwallis mentions him with warm praise of his "talents, temper, and judgment," and only qualifies his opinion in one place, when he says, on July 3, 1800, that "Littlehales very much surpasses Lord Castlereagh in the private management of mankind from his good humor and kind attention to everybody." Here Cornwallis touches the greatest political fault of Castlereagh, which destroyed his popularity, and ruined his reputation—his want of sympathy for human weaknesses.

Castlereagh was sworn of the English privy council in December, 1799, and returned to the first united parliament for the county of Down. He had no intention of permanently losing office by his advocacy of the Catholic claims, and therefore, instead of going into violent opposition like Canning and others of the late administration, he supported the weak Addington ministry, and in June, 1802, was appointed president of the Board of Control. On Pitt's return to power in December, 1804, he kept Castlereagh in office, and in 1805 made him secretary of state for war and the colonies, as well as president of the Board of Control. For the six months he held the war office he was Pitt's right hand in administration, as Canning was in debate. He now prepared a great expedition of thirty thousand men, who were to land in Hanover and make a diversion in northern Germany in favor of the Russians and Austrians. The expedition was too late to be of any use, but it deserves notice as illustrating Castlereagh's favorite idea that England should carry on "grande guerre," which was to appear to a greater extent later. His present tenure of office was but short, for Pitt's Government resigned on his death in January, 1806.

When Pitt died, Castlereagh was prime mover in the attempt to make Lord Hawkesbury premier, and when that failed, sooner than give up all hope of place, he declared that he and his friends "looked to" Lord Grenville. Grenville, however, formed his ministry of "all the talents" out of the sections which followed Fox, Windham, and Sidmouth. The opposition was led in the House of Commons by Castlereagh and Canning. Now began the close association of these two celebrated men, each of whom hoped to lead the Tory party, and who did so in turn, both Irishmen from the same county of Londonderry, both in the prime of life, and distinguished—the one for his surpassing eloquence, the other for his administrative powers. Each rival despised the other: Castlereagh, conscious of his high birth and noble connections, looked down on the son of the actress; Canning, conscious on his side of his great talents for debate, looked down on the clumsy debater and laborious parliamentary tactician, who looked to governing the country rather by a careful manipulation of boroughs and patronage than by eloquence and statesmanship. Castlereagh again, proud of his position as an ex-cabinet minister, pretended to lead Canning, who had held but inferior posts; while Canning, in his ardent devotion to the memory of Pitt, sneered at the man who had taken a seat in Addington's cabinet. This rivalry was increased almost to personal dislike by the marriage of Castlereagh's sister to the son and heir of that uncle of Canning's, Paul, in whose favor his own father had been disinherited, and who some years later was made Lord Garvagh. The rivals were not long in opposition, the new ministry resigning in 1807. The duke of Portland formed a new administration on strictly anti-Catholic principles, in which Castlereagh and Canning, both advocates of the Catholic claims, were secretaries of state, the former for war and the colonies, the latter for foreign affairs. During the two years they remained in office together each chafed at the other. The chief events connected with the war office during this tenure of office were the expeditions to Copenhagen, the Peninsula, and Walcheren. Of the Copenhagen expedition the chief credit or discredit must rest with Canning, but the merits of its execution rest entirely with Lord Castlereagh, who showed himself a war minister far superior to Dundas and Windham, and despatched in perfect secrecy a large military and naval expedition, which was swiftly and entirely successful. On the subject of the Portuguese expedition and the assistance to be afforded to the Spanish insurgents, the two secretaries were of different opinions. Canning sent the Spaniards officers, money, and arms in profusion, but was reluctant to send a great army, while Castlereagh planned the Portuguese expedition, chose Sir A. Wellesley to command it, and deserves the credit of Vimiera. Napier in his *Peninsular War* proves how wrong Canning was, how impossible it was to organize out of the Spaniards a force able to resist Napoleon, and how right Castlereagh was in believing in the efficacy of a British army. The Walcheren expedition went far utterly to ruin Castlereagh's reputation, and completed the difference between Canning and himself. Yet the conception was good. Castlereagh prepared the expedition with skill and secrecy, though with slight regard for men's lives, as appeared in his choice of the unhealthy island of Walcheren for debarkation, in his refusal to send enough doctors or hospital ships, and in his appointment of Lord Chatham to command in chief. In this appointment of Chatham appears the radical vice of his war administration: he looked before giving a command on active service to parliamentary influence, not tried ability. The failure of the expedition brought about a crisis in the cabinet. In April, 1809, Canning had sent in his resignation to the duke of Portland, declaring that he could no longer serve with Castlereagh, but the matter was put off from time to time, and at length Canning consented to wait till the Walcheren expedition was over. In September he insisted once for all that something must be done, and then for the first time Castlereagh heard that his dismissal had been determined on for some months. He was naturally indignant, and being unable to challenge Lord Camden, his benefactor, who had really behaved worst to him, or the old duke of Portland, he challenged Canning, who had throughout protested against the manner in which Castlereagh had been treated. On September 21 they met on Putney Heath, when Canning was slightly wounded in the thigh, and Castlereagh had a button shot off his coat. After this duel both resigned, and remained out of office two years, but Castlereagh did not intend to remain so, and through the influence of his aunt, old Lady Hertford, with the prince regent he was, after the refusal of Canning, offered the secretaryship of state for foreign affairs in March, 1812, in the room of Lord Wellesley. On Perceval's assassination in May, 1812, the leadership of the House of Commons was given to Castlereagh. The first ten years of Lord Liverpool's administration were the palmy days of the Tory aristocracy, and during them Lord Castlereagh was the guiding spirit of foreign policy in the cabinet, and the

faithful interpreter of Lord Sidmouth's home policy in the House of Commons. Once in power, he perceived that Napoleon must be beaten in Germany, and that, though Lord Wellington's army in Spain must be supported to maintain the credit of English soldiers, and occupy as many French troops as possible, the important point was for the Russian and Prussian monarchs to be joined by the Austrian emperor, and follow up the blow Napoleon had dealt himself in his invasion of Russia. To bring Austria into the field, manage the crown prince of Sweden, maintain the alliance of the great powers and the harmonious working of their armies and policies, Castlereagh gave the English ambassadors at the courts of Austria, Russia, and Prussia, full powers to correspond with each other, and follow the allied forces. The ability with which these instructions were carried out is to be read in the history of the whole campaign of 1813, and of the congresses of Mannheim and Frankfort. When the allies entered France, Castlereagh himself left England to attend the congress of Chatillon. He remained with the armies of the allies, entered Paris with them, and signed the preliminaries of peace. Great was the applause he received on his return from the people, and above all in the House of Commons. The prince regent made him a Knight of the Garter, an honor which had only been conferred on two commoners, Sir R. Walpole and Lord North, for the last two hundred years, and when the allied sovereigns visited London they treated him with marked favor, so that it was no wonder, when he started to take his seat as British plenipotentiary at the congress of Vienna, he believed himself to be a great diplomatist. That he was mistaken in this was conclusively proved by that congress where, as Von Gentz said, England could have done anything, and did nothing. Throughout he supported Metternich, partly because Metternich's nature had mastered him, but more because he had imbibed a blind distrust of Russia. When the return of Napoleon from Elba put an end to the quarrels which were nearly ending in a general war between Prussia and Russia on the one side and England, France, and Austria on the other, and united all parties against him, Castlereagh returned to England, and expressed his confidence in a speedy termination of the new struggle, which indeed was closed at Waterloo. He signed the second peace of Paris on behalf of England, and on his return his father was created marquis of Londonderry. From this time his career can be sketched very shortly. At home the grand harvest of 1815 was followed by very bad ones, and great discontent existed both among the agricultural and manufacturing classes. The Government pursued the same tactics which had in 1793 united nearly all the upper classes in a fever of reaction; they established a secret committee which declared the existence of a widespread conspiracy, and it was often their spies who threw into the meetings of the discontented sufficient politics to make them look like conspiracies. The bad feeling existing came to a climax with the Peterloo massacre, and Lord Sidmouth introduced his Six Acts to check a network of conspiracies which mostly did not exist. Castlereagh had to introduce the Six Acts in the House of Commons, and as usual spoke of the people with the air of hauteur and contempt which made him so particularly obnoxious to them. His foreign policy during these years was chiefly inspired by a real desire to maintain the peace of Europe, which he believed was only to be preserved by the harmony of all the monarchs and their foreign ministers, and to preserve this harmony he was so loth to differ from them on any subject that it was commonly believed among the people that he had signed the Holy Alliance. At the congress of Aix-la-Chapelle in 1818 it was for this reason that he recommended that France should be freed from the army of occupation. The death of George III. in January, 1820, made no difference to Castlereagh, who was greatly in the favor of the new king, and who had no difficulty in supporting the Bill of Pains and Penalties against the queen. Scarcely was the excitement of the queen's trial and the king's coronation over, when Lord Londonderry, for he had succeeded to that title in this very year, accompanied the king to Hanover in October, 1821, to discuss the revolutions in Greece and Spain with Metternich. The interviews which then took place are fully described in Metternich's *Autobiography* (vol. iii. pp. 552–560), and exhibit clearly the paramount influence of Metternich over Lord Londonderry, whom he persuaded to take part in a congress at Verona in the following year. While he was making preparations to start, he became possessed by many strange delusions, which clearly indicated that his mind was unhinged by overwork, as it had been once before after the passing of the Union with Ireland. This soon became obvious to every one; the king noticed it; and the duke of Wellington sent a physician down to Foots Cray to see him. The doctor found him suffering from melancholia, and ordered his razors to be taken away, but in spite of all precautions he procured a penknife and committed suicide on August 12, 1822. His body was conveyed to London to be buried in Westminster Abbey, and just as it was being lowered into the grave a cry of exultant hatred arose from that rabble he had so despised.

Castlereagh's character illustrates the strange difference which in corrupt times can exist between public and private morality. In private life he was a strictly honorable and affectionate man; he was a good husband, a good son, a good brother, and a good master; but even in his private relations that want of warmth which made Cornwallis declare he was utterly unlike an Irishman, and Wilberforce liken him to a fish, seems to have existed, and seems to have been part of his temperament. In public life he played quite a different part, and, though he had one or two firm political principles, as appears in his steady advocacy of Catholic emancipation, he seems as a rule to have regarded politics as a game, in which all means were fair to win, and very extraordinary some of his means appear to be. Though a very bad and confused speaker, he was very successful as a parliamentary leader, from the care with which he used his patronage, and the amount of votes he won by it. While not a great diplomatist, as the mastery Metternich obtained over him clearly proved, as an administrator he deserves the highest praise, steadily punctual to his work, never allowing arrears to accumulate, and never neglecting a detail; but his parliamentary necessities stood in his way; every appointment was given from a party point of view, and if, as in the case of Sir A. Wellesley, chance sometimes led him right, jobbing more often led him wrong. But the chief interest which centres in Lord Londonderry is that he was the last leader of an extinct class. The old aristocrats who lived by politics, and thought all means fair in politics, are gone for ever, and with Londonderry's death the unnatural tension of the reaction from the excesses of the French Revolution ceased, and modern Conservatism, containing indeed many prejudices and an exaggerated admiration for what is fixed, came into being with its real sympathy for all mankind, which the old Tories, and more especially Lord Londonderry, would have despised.

The best materials for studying Londonderry's life and opinions are his *Despatches* edited by his brother, the third marquis, in 12 volumes. They are, however, very incomplete from the loss of the most valuable at sea in the wreck of the ship which was taking Mr. Turner, Lord Londonderry's chosen biographer, to India. The *Cornwallis Correspondence* for his Irish work, and the supplementary *Wellington Despatches* should also be used. Alison's *Lives* of Lord Castlereagh and Sir Charles Stewart are interesting reading, but abound with that celebrated author's usual faults, and should be corrected by Walpole's *History of England* from 1815. Of contemporary diaries, Rose's, Lord Colchester's, Romilly's, and Wilberforce's, with Pellew's *Life of Lord Sidmouth*, should be consulted, and Metternich's *Autobiography* for the later foreign policy. Mr. Thornton has a short biography in his *Lives of the Foreign Secretaries from 1800*, which is chiefly valuable from his

access to the unpublished memoranda of Lord Bexley, who as Mr. Vansittart was chancellor of the exchequer, and helped to lead the Commons from 1812 to 1822. (H. M. S.)

LONG, GEORGE, an English scholar (1800–1879), was born at Poulton in Lancashire, on the 4th of November, 1800. From Macclesfield grammar school he went to Trinity College, Cambridge, in 1818. He was elected Craven University scholar in 1821, together with Lord Macaulay and Professor Malden, took his degree in 1822 as wrangler and senior chancellor's medallist, and the next year gained a fellowship over the heads of his two distinguished rivals. In 1824 Long went out to be professor of ancient languages in the new university of Virginia. There he married his first wife, the widow of Colonel Selden. In 1828 he returned to England to accept the Greek professorship in the newly-founded university of London. His introductory lecture in 1828 was followed in 1830 by another entitled *Observations on the Study of the Latin and Greek Languages*. The etymological appendix to this lecture is of interest in the history of classical philology in England, as illustrating the scientific comparative method of teaching the Greek and Latin languages first adopted in the London university by himself and his colleague, Professor Key. He published a *Summary of Herodotus* (1829), and editions of Herodotus (1830–33) and Xenophon's *Anabasis* (1831). He was one of the founders of the Royal Geographical Society in 1830, and was for twenty years a member of the council, or officer of the society; in the same year he joined the committee of the Society for the Diffusion of Useful Knowledge, and was till 1846, when the society was dissolved, one of its most active workers. In 1831 he resigned his professorship and became editor of the society's *Quarterly Journal of Education* (1831–35), for which he wrote many articles. He wrote for the society's Library of Entertaining Knowledge the two volumes of *The British Museum; Egyptian Antiquities* (1832–36), and edited, improved, and wrote parts of the companion volumes *Elgin and Phigaleian Marbles* (1833), and *Townley Marbles* (1836). He planned and edited for the Library of Useful Knowledge a *Geography of America and the West Indies* (1841), of which he wrote a small part, and a *Geography of Great Britain: Part I. England and Wales*, part of which he also wrote himself. He contributed two maps of Egypt and Persia, ancient and modern, to the society's Atlas (1831). From 1833 to 1846 he was engaged on the great labor of his life, the editing of the twenty-nine volumes of the *Penny Cyclopædia*, to which he was also an extensive contributor of articles. The committee appointed Long and Charles Knight editors, but after the publication of a few numbers Knight took no part in the superintendence of the work, and all the editorial labor was done by Long,

A more colossal and the final venture of the society was its *Biographical Dictionary*, of which Long was also appointed editor. He wrote numerous articles in the seven volumes which appeared (1842–44), but the great expense did not allow it to proceed beyond the letter A. Long was also a member of the committee of the Society for Central Education, instituted in London in 1837, and contributed two essays to its *Second* and *Third Publications* (1838–39). In 1837 he was called to the bar of the Inner Temple. He accepted in 1842 the professorship of Latin in University College, vacated by his friend Mr. Key, which he resigned in 1846, on being appointed by the benchers of the Middle Temple their reader on jurisprudence and the civil law. *Two Discourses delivered in the Middle Temple Hall, with an Outline of the Course*, were published in 1847. He wrote all the articles on Roman law in the *Dictionary of Greek and Roman Antiquities*, edited by Dr. William Smith (1842), and contributed also to the companion *Dictionaries of Biography* (1844–49), and *Geography* (1854–57). His translation of thirteen of Plutarch's *Lives*, with copious notes, first came out in five of Knight's weekly volumes under the title of *The Civil Wars of Rome* (1844–48). He planned and edited Knight's *Political Dictionary* (1845–46), a revision of articles from the *Penny Cyclopædia*. Knight published in parts his *History of France and its Revolutions, 1789–1848* (1850).

In 1849 he left London and went to Brighton College, where he was classical lecturer until midsummer 1871. He was an excellent teacher, and was beloved by both masters and pupils. Whilst here he edited, at first jointly with the Rev. A. J. Macleane, and after that gentlemen's death by himself, the *Bibliotheca Classica* series, to which he himself contributed the edition of Cicero's *Orations* (1851–62), a task for which his legal knowledge eminently qualified him. He also revised, making many corrections and additions, Macleane's editions of Juvenal and Persius (1867), and Horace (1869). He made for Bell's Grammar School Classics editions, with introductions and notes, of Cicero's *De Senectute* and *De Amicitia*, with a selection from his *Epistolæ* (1850), Cæsar's *Gallic War* (1853), and Sallust's *Catilina* and *Jugurtha* (1860). He also edited an *Atlas of Classical Geography* (1854). His translation of the *Thoughts of the Emperor M. Aurelius Antoninus* was published in 1862. The same year appeared anonymously the amusing and instructive little volume called *An Old Man's Thoughts about Many Things*. He was sixty-four when he issued the first of the five large octavo volumes of his *Decline of the Roman Republic*. In 1871 he resigned his post at Brighton College, and retired to Portfield, Chichester, to take a rest well-earned but from labors ill-rewarded. In 1873 the Queen, on the recommendation of Mr. Gladstone, granted him a pension of £100 a year. At Portfield he completed his *Roman History* (1874), and translated *The Discourses of Epictetus, with the Encheiridion and Fragments* (1877). This was the last work of his laborious and useful life. He died after a long and painful illness on the 10th of August, 1879.

In addition to the works already noticed, Long was the author of two papers in the *Journal of the Royal Geographical Society*, a few in the early numbers of the *Penny Magazine*, and several in the *Classical Museum* and *English Journal of Education*. He also wrote on "Grammar Schools," in Knight's *Store of Knowledge*.

Long has exercised by his writings, and indirectly through some of his London university pupils, a wide influence on the teaching of the Greek and Latin languages in England. The publication of the *Bibliotheca Classica* (begun in 1851) did important service, and set English scholars an excellent example, at a time when editions with English notes containing accurate learning and sound scholarship were, with a very few exceptions, not to be found. Some of the volumes of this series still remain the standard English editions. In the knowledge of Roman law Long stood by himself amongst English scholars, and his well-known articles on that subject were the first valuable contribution to the study from any English writer. He had also a profound knowledge of ancient geography. He was an excellent French, German, and Italian scholar, and also read Spanish. His extensive and accurate learning may be explained from the combination of a tenacious memory with a clear judicial intellect. His character was as elevated as his intellect. Its simplicity and manly independence may be seen partly in his writings. His faculty for discriminating evidence and his strong common sense appear in everything that he wrote. (H. J. M.)

LONG BRANCH, a fashionable seaside resort of the United States, in Ocean township, Monmouth county, New Jersey. The old village lies about a mile inland, but the watering-place proper is for the most part situated on the bluffs and plateau immediately above the beach. The bathing grounds are excellent; there are fine drives along the beach in the vicinity; upwards of twenty thousand visitors can find accommodation in the hotels alone, of which there are no less than thirty-three; and there are besides hundreds of private residences occupied mainly by the wealthier classes from New York and Philadelphia. Since 1874 it can be reached directly from New York both by railway and by steamers. Long Branch has a corporation

of seven commissioners. Its permanent population in 1880 was 3833, in 1900 about 8,872.

LONGEVITY is a term that may be applied to express either the length or duration of life of any organism, or the prolongation of life to an advanced age. The first meaning is the more scientific of the two, as it may be applied to the duration of the life of any organism, although that duration may be relatively short; thus, we may contrast the longevity of the mould which lives only a few hours with that of the forest tree which has survived for centuries, or the longevity of the ephemeral insect with that of an eagle or swan, whose lives may be prolonged to over a century. On the other hand, the second meaning is the more common, as when an instance of very advanced age is spoken of as an example of great longevity.

The information we possess as to the natural duration of life of the lower forms of plants and animals is very meagre, and it can scarcely be asserted that in all there is a natural period of life. A simple organism composed of cells, or even one more complicated but still having the organs necessary to life constructed upon a simple type, may continue to live and grow so long as external conditions are favorable. There may be no tendency to decay of tissue inherent in the organism, so that life may be prolonged until a change in external conditions, quickly or slowly, so affects the processes of nutrition as to make the continuance of life impossible beyond a certain time. It is also highly probable that in both the animal and vegetable worlds comparatively few individuals are permitted to live undisturbed for a sufficient length of time to allow any inherent tendencies to decay to show themselves. In the struggle for existence few individuals even reach maturity; at an early period they are used to support the lives of other and perhaps stronger organisms.

Excluding the lower forms of plants, as to the duration of whose lives we know nothing, the higher plants may be classed, according to duration of life, as follows:—*annuals*, or *semi-annuals*, which grow up in spring and die in autumn; *biennials*, which die at the end of the second year; and *perennials*, the duration of which may last from four to thousands of years. Succulent plants have a short life, lasting only one or two years; the formation of wood is necessary for prolonged vegetable existence. It has been pointed out that strongly scented plants have often a longer duration of life than those destitute of smell. Thus thyme, mint, hyssop, marjoram, sage, etc., can live for two years or longer; whilst lettuce, wheat, oats, barley, live no more than a year. Trees of rapid growth, such as fir, birch, horse-chestnut, form soft wood, and have a comparatively short life; whilst hard-wood trees, such as the oak, grow slowly and live long. It is not, however, an invariable rule that trees yielding hard wood live longest. The beech, cypress, juniper, walnut, and pear all form hard wood, but they do not live so long as the lime, which forms a softer wood. Trees which are long in producing leaves and fruit, and which also retain these for a long time, live longer than those in which these changes occur quickly. Fruit-bearing trees, producing a sour harsh fruit in the wild state, have longer lives than those bearing sweet fruits in the cultivated state. By skilful pruning, or lopping off the branches and buds, the term of life of even short-lived plants may be lengthened.

According to Hufeland, the chance any plant has of attaining a great age depends on the following conditions:—(1) it must grow slowly; (2) it must propagate slowly and late in life; (3) it must have a certain degree of solidity and hardness in its organs, a sufficiency of wood, and the sap must not be too watery; (4) it must be large and have a considerable extent of surface; and (5) it must rise into the atmosphere. If we view a tree as consisting of an enormous number of buds clustered on a common stem in which the vessels or channels for the circulation of the sap remain pervious, and in which also new wood is formed annually, there seems to be no limit to age provided external conditions are favorable. Many large trees have reached a vast age, as shown by the following table compiled by De Candolle:—

	Years.
Elm (*Ulmus campestris*)	335
Cypress (*Cupressus sempervirens*)	350
Cheirostemon platanoides	400
Ivy (*Hedera Helix*)	450
Larch (*Larix europæa*)	576
Chestnut (*Castanea vesca*)	600
Orange (*Citrus Aurantium*)	630
Palms (*Ceroxylon* and *Cocos*)	600–700
Olive (*Olea europæa*)	700
Oriental plane (*Platanus orientalis*)	720
Cedar (*Cedrus Libani*)	800
Lime (*Tilia europæa*)	1076–1147
Oak (*Quercus Robur*)	810, 1080, 1500
Yew (*Taxus baccata*)	1214, 1458; 2588, 2880
Taxodium distichum	3000–4000
Baobab[1] (*Adansonia digitata*)	5000

In the animal kingdom there is great variety as regards the duration of life, but no accurate data have yet been collected. Certain *Infusoria* have been watched during the whole period of their existence, which has not lasted more than forty-eight hours; on the other hand, *Actiniæ*, or sea anemones, may live to a long age, as shown by the case of a specimen of *Actinia mesembryanthemum*, still alive in Edinburgh, which belonged to Sir John Dalyell, and which must be at least about seventy years of age. It is highly probable that cold-blooded animals, such as fishes, frogs, toads, in which tissue-changes go on with extreme slowness, especially during a period of muscular inactivity, may live for many years. In the imperial fish-ponds of ancient Rome lampreys were said to have attained their sixtieth year; pike and carp have been ascertained to live a hundred and fifty years; tortoises have reached the age of one hundred years; and it is alleged by natives of India that the crocodile may live for at least a hundred years, and that there seems to be no limit to its time of growth. Many birds have a long period of life. Eagles and crows have been known to live a hundred years, and parrots have been kept in confinement for sixty years. Peacocks attain an age of twenty years; barn-door fowls live for a much shorter period, from six to twelve years. Small birds seem to have shorter lives than large ones. Blackbirds, goldfinches, and canaries have been known to live for twenty years; but many of the smaller birds attain an age of only five or six years.

Amongst mammals, the elephant is supposed to attain the greatest age, reaching above a hundred years; the camel generally lives to fifty years, and may live to eighty; the horse does not live more than forty years; the deer, thirty years; the ox, fifteen to twenty years; sheep, goats, foxes, hares, rabbits, from seven to ten years; and dogs and pigs from fifteen to twenty years. Certain general statements may be made, which do not deserve to be termed laws, but which briefly express relations that undoubtedly exist in many cases between the degree of longevity enjoyed by any species of animal and the conditions of its existence.

1. A relation can often be traced between the duration of life and the time of the development of the animal *in utero*. To this statement there are many exceptions, as will be apparent from the following table, in which the periods of gestation are given on the authority of Professor Owen (*Comp. Anat. and Phys. of Vertebrates*, vol. iii.):—

Name.	Period of Gestation in Days.	Longevity in Years.	Name.	Period of Gestation in Days.	Longevity in Years.
Elephant	593	100	Monkey (*Cebus*)	150	10
Giraffe	440	Not known.	Pig	120	15–20
Mare and Ass	330	30–40	Marmoset	120	Not known.
Cow	286	15–20	*Lemur albifrons*	105	Not known.
Human Being	280	80–100	Wolf, Jackal, Dog	63	15–20
Roe Deer	280	30	Cat	56	15–20
Red Deer / Fallow Deer	245	30	Bat (*Vespertilio noctula*)	40	Not known.
Hippopotamus	234	Not known.	Kangaroo	38	Not known.

In the case of birds no relation of this kind can be

[1] [The Baobab is now known to be a fast-growing, short-lived tree.—Am. Ed.]

discovered. For times of incubation of many birds see Owen, *op. cit.*, vol. ii. p. 257.

2. It would appear that the sooner a being attains maturity the sooner it propagates, and the shorter will be the duration of its life. The reproductive act may be regarded as the culminating act of the organism, requiring the highest degree of vitality, and involving the largest expenditure of energy. This act will therefore be performed when the organism has reached maturity; in some cases the animal reaches maturity late, in other cases early; but in all the epoch of maturity may be taken as about a fifth part of the whole duration of life. Thus the elephant and the human being do not reach maturity till say the twentieth year, and the period of longevity is about a hundred years; the horse, ass, and bull are mature in the third or fourth year, and live from fifteen to twenty years; sheep come to maturity in the second year, and live from eight to ten years; whilst rabbits and guinea pigs are mature within one year, and live only from four to five years. Here again there are exceptions, as, for example, the cat is mature before the end of the first year, and still it may live to the age of twenty years. Much information is still required on these points before a law can be formulated.

The question of longevity, however, probably presents the greatest interest in its relation to man. It is still a popular belief that the earliest inhabitants of the world possessed an incredible strength, were of an enormous size, and lived to a very great age; and the ages of the patriarchs before the flood are often taken literally, although the conditions making such long lives possible are at variance with those of human existence at the present day. In ancient history there are instances given of heroes who attained the age of several hundred years, but these must be regarded as mythical. For an interesting account of these, see Hufeland's *Art of Prolonging Life*, p. 62 *sq.*

The following are a few instances of extreme longevity which have been placed on record:—Margaret Patten, 137; the countess of Desmond, 145; Thomas Parr, 152; Thomas Damme, 154; John Rovin, 172; and Peter Torton, 185. There can be little doubt that the ages of these persons have been much exaggerated. They lived at a time when no accurate chronological records were kept, and when it was the habit to fix the dates of occurrences by comparing them in the memory with other events believed to have happened about the same time. Thus there were many sources of fallacy, although the narrators no doubt believed their statements to be quite accurate. Still these were instances of prolongation of human life far beyond the usual limits, and there is no reason for doubting that they all lived till they were upwards of a hundred years of age.

Perhaps the best authenticated instance of this kind is that of the famous Thomas Parr of Shropshire. "He was a poor farmer's servant, and obliged to maintain himself by daily labor. When above one hundred and twenty years of age he married a widow for his second wife, who lived with him twelve years, and who asserted that during that time he never betrayed any signs of infirmity of age. Till his one hundred and thirtieth year he performed all his usual work, and was accustomed even to thresh. Some years before his death his eyes and memory began to fail, but his hearing and senses continued sound to the last. In his one hundred and fifty-second year his fame had reached London; and, as the king was desirous of seeing so great a rarity, he was induced to take a journey thither. This, in all probability, shortened his existence, which he otherwise might have preserved some years longer; for he was treated at court in so royal a manner, and his mode of living was so totally changed that he died soon after, at London, in 1635. He was one hundred and fifty-two years and nine months old, and had lived under nine kings of England. What was most remarkable in regard to this man, is that, when his body was opened by Dr. Harvey (the discoverer of the circulation of the blood), his internal organs were found to be in the most perfect state, nor was the least symptom of decay to be discovered in them. His cartilages even were not ossified, as is the case in all old people. The smallest cause of death had not yet settled in his body; and he died merely of a plethora, because he had been too well treated."—Hufeland, p. 71.

The late Sir George Cornewall Lewis attempted to show that all such narratives were so inaccurate as to reduce the ages of the parties to something under a hundred years, and he was disposed to think that there had been no instance of a human being attaining the age of a hundred years. But subsequent cases have shown that a few have attained that great age. In these cases the evidence has not been of a collateral kind, nor has it depended on human memory, but it has been established by written records. Scarcely a year passes without instances occurring in which the evidence that the deceased attained a hundred years cannot be controverted, and there is no doubt that, when a sufficient time from the beginning of the system of registration of births has elapsed, such cases will be more common.

The average duration of life in Europe is about thirty-four years. It oscillates between 28·18 years (Prussia) and 39·8 years (Schleswig-Holstein, Lauenburg). In Naples it is quoted at 31·65 years. This falls far short of the possible longevity, a circumstance chiefly to be accounted for by the great mortality in the early years of life. According to De Quatrefages, the duration of life is almost universally the same amongst the best known peoples. Laplanders live to a great age, men of from seventy to ninety years of age being common among them. The American Indians have apparently as long a life, on the average, as the white men living in the same locality. It would appear to be the same in the case of the negro. Prichard quotes from an official document of the State of New Jersey, showing that the census gave one negro centenarian in the 1000, but only one white centenarian in 150,000; on the other hand, the negro of the Senegal ages early, and does not live long. In his native place he is exposed to unhealthy influences which tell upon him, although he resists the bad effects of these longer and better than the white man; but when he is transplanted to America he enjoys a longer life.

The manner of life and nature of the occupation, apart from hereditary and special causes, have a most important influence on the duration of life. Few emperors or kings have attained the age of eighty; and, of more than three hundred popes, only six have exceeded the age of eighty. It would seem that brain work is not unfavorable to longevity. It is almost proverbial that statesmen and judges often reach an advanced age. Many men famous in literature and science have lived to an old age. Thus from fifty to sixty we have Tasso, Virgil, Shakespeare, Molière, Dante, Pope, Ovid, Horace, Racine, Demosthenes; from sixty to seventy, Lavater, Galvani, Boccaccio, Fenelon, Aristotle, Cuvier, Milton, Rousseau, Erasmus, Cervantes; from seventy to eighty, Dryden, Petrarch, Linnæus, Locke, Handel, Galileo, Swift, Roger Bacon, Charles Darwin; from eighty to ninety, Thomas Carlyle, Young, Plato, Buffon, Goethe, Franklin, Sir W. Herschel, Newton, Voltaire, Halley; and from ninety to one hundred, Sophocles, Leeuwenhoek, Michelangelo, Titian. Physicians are often long lived: Boerhaave, Haller, Gall, Darwin, Van Swieten, Fallopius, Jenner, Cullen, Galen, and Spallanzani died between seventy and eighty years of age, and Harvey, Duhamel, Pinel, Morgagni, Heberden, and Ruysch between eighty and ninety; whilst the father of medicine, Hippocrates, is credited with one hundred and nine years.

A valuable set of statistics have been collected by Hirt (*Die Krankheiten der Arbeiter*) regarding the influence of trades on longevity. An abstract of these will be found in Buck's *Hygiene and Public Health*, vol. ii. pp. 71, 72.

The best indication of longevity in a community is given by the expectation of life from any given age. It is obtained by adding together the number of years which the entire population live from any specified age, and dividing the resulting total "years of life" by the num-

ber living at the year of age for which the expectation of life is desired (*English Life Table*, p. xxxiii.). Thus we may find the duration of the portion of human life which an individual at any age may expect to enjoy. Such calculations are of great value in connection with assurance, and indeed in all pecuniary transactions in which the value of life contingencies are taken into account. They are the bases of all systems of life assurance. Life assurance companies have now been able to collect sufficient numbers of cases of their own experience on which to find trustworthy calculations showing the expectation of life at different ages. Such tables have really been compiled from selected cases, namely, from those who have assured, and consequently differ somewhat from those compiled on the broader data obtained from the whole population. The following table, derived from both sources of information, is given briefly to indicate the expectation of life, or the longevity, from various ages, reference being made for details to the article INSURANCE. The table to be read thus: a person thirty years of age has an average expectation of living 33·3 years longer, or of attaining the age of 63·3 years.

Ages.	England and Wales. Farr, 1838–54.	Combined Experience of 17 English Offices, 1843.	Ages.	England and Wales. Farr, 1838–54.	Combined Experience of 17 English Offices, 1843.
0	40·9	...	60	13·9	13·77
10	47·4	48·36	70	8·7	8·54
20	39·9	41·49	80	5·1	4·78
30	33·3	34·43	90	2·9	2·11
40	26·7	27·28	95	2·2	1·28
50	20·1	20·18			

What are the physiological conditions in the human being that determine longevity? In the first place, there is the influence of heredity. Certain peculiarities of tissue are transmitted from parent to offspring that determine whether or not the tissue will remain for a lengthened period of time in a normal condition, or whether it will quickly yield to external influences and take on an abnormal action. As the life of the body is really the sum of the lives of its constituent parts, or in other words, of the cellular elements composing it, it is evident that anything affecting the healthy action of these elements will affect the life of the body as a whole. In some individuals the tissues have what may be termed a hereditary taint, by which is meant a want of stability, so that they pass readily from a normal into an abnormal condition; and this is unfavorable to longevity.

In the next place, even healthy tissues capable of resisting ordinary influences may be unable to resist long-continued unfavorable conditions. In course of time slow changes begin in the tissue; these in turn affect the organ in which the tissue exists, and the organ, by improperly performing its functions, injures the organism. Thus it is that habitually breathing an impure atmosphere, eating improper food, saturating the body with drugs or with alcohol, over-exerting the nervous system by excitement or prolonged brain-work or worry, and sexual excesses debilitate the body by working slow but sure changes in the tissues which will inevitably tell upon the longevity of the individual.

But even in the most favorable conditions there seems to be a limitation to the healthy action of tissues, and old age comes on. Whether this is or is not the result of long hereditary transmission it is not of much practical importance to ask, as it is a state of things all flesh is heir to. But, if it be hereditary, as is highly probable, there is the satisfaction of knowing that hereditary states can be slowly influenced by individuals living in the best possible conditions and transmitting the influences of good moral and physical hygiene. If bad hereditary qualities are transmitted, good qualities have even a better chance of being perpetuated, as they favor the individual in the struggle for existence. Thus a race which has a low degree of longevity may acquire, by persistent attempts to live in the best conditions, a long average duration of life. This is also true, though to a less extent, of an individual life.

Each tissue has a life of its own; it is developed, reaches maturity, declines, and dies. It may be replaced by successive generations of similar tissues, but the power of reproduction of tissue becomes weakened, and by slow degrees the tissue may disappear, or it may become so altered as to be quite unlike what it was at first. By these tissue-changes functional changes of great importance to the body are brought about. Thus, as age comes on, the blood becomes poorer; respiration is less active; the vital capacity of the chest, that is the working-quantity of air, is diminished; the temperature of the body is slightly increased, so that the aged are more sensitive to cold; the digestive organs are less vigorous; the walls of the arteries become hardened by earthy matter, and lose their elasticity; the veins become dilated, and the circulation is not efficiently performed; the teeth decay and disappear; the cartilages become calcified and hard; the skin is shrivelled and dry, and cutaneous respiration and excretion are less perfect; the hair whitens or falls off; the stature and the weight diminish. By and by muscular movements are less energetic and less precise; the hands tremble and the head shakes; and there is a tottering gait. The cartilages of the larynx ossify, the vocal cords lose their elasticity, and the voice becomes a shrill treble. Then the involuntary muscular tissues are affected so that the bladder is less powerful and defæcation is feeble. The transparent media of the eye become dimmed, the near point of vision is pushed back so that the old man becomes presbyopic, or far-sighted, and the power of accommodation, or focussing of the eye, is entirely lost; the delicate mechanism of the drum and bones of the ear is impaired, so that deafness results; and even touch becomes less delicate. Slowly the intellectual faculties become weakened, the emotions are blunted, and the memory becomes by degrees less trustworthy, and at last vanishes. Much of the time is now spent in sleep, and unless some intercurrent disease snaps the thread of life there is a slow ebbing of existence into natural death. Essentially these phenomena are due to delicate changes in the tissues, visible only with the aid of the microscope. These changes are those of wasting or atrophy, meaning a failure of nutrition, or fatty changes, or those caused by infiltration into the tissue of earthy matter, which soon destroys its healthy functions.

LONGFELLOW.

Copyright, 1904, *by The Saalfield Publishing Company.*

LONGFELLOW, HENRY WADSWORTH, the foremost of American poets, was born on February 27, 1807, "in a square wooden house on the edge of the sea," in the city of Portland, Maine—Maine then being a Province of the State of Massachusetts. The family from which he sprang was one of distinction. It was founded in America by William Longfellow, of Hampshire England, a man of property and culture, who came to this country in 1676, at the age of twenty-five years, and settled at Newbury, Massachusetts. He was drowned off the coast of the desolate island of Antieosti, Canada. His son, Stephen Longfellow, was a blacksmith by trade, and some family traditions of him are supposed to have suggested to the poet portions of his familiar poem "The Village Blacksmith." Stephen Longfellow married Abigail Thompson, daughter of Edward Thompson, of Marshfield, Massachusetts, who bore him ten children. In 1745 he removed from Newbury to Portland, Maine, where the family remained. His son,

Stephen Longfellow 2nd, was educated at Harvard, and showed much intellectual ability, and his son, Stephen Longfellow 3rd, was also graduated from Harvard in 1798. The last named was the father of Henry Wadsworth Longfellow. A sister of Stephen Longfellow was married to Samuel Stephenson, a wealthy merchant of Portland, and as her husband was called to the West Indies for the winter of 1806–7, she invited her brother and his family to spend the winter with her, in the Stephenson mansion, one of the largest and finest in the city. They did so, and thus it came to pass that the poet was born in that house. He was named Henry Wadsworth after his mother's brother, Lieutenant Henry Wadsworth, of the United States navy, who was one of the heroes of the war with Tripoli and lost his life in it, on September 4, 1804, in a most gallant enterprise. It may be added that Stephen Longfellow, the poet's father, was for some years a member of Congress and occupied a distinguished place in the community. Mrs. Longfellow, the poet's mother, was descended from John Alden, of Plymouth, whom Longfellow celebrated in one of his best known narrative poems, "The Courtship of Miles Standish."

The childhood of the poet was spent in Portland, and his environment there doubtless strongly influenced his impressible mind. For Portland was then, as it is now, a place of rare and compelling beauty. Seated upon a throne of hills, overlooking Casco Bay and its more than a hundred islands and the Atlantic Ocean beyond, with a prospect across the plains and lakes of Maine bounded by the majestic wall of the White Mountains, and with broad, elm-shaded streets and stately colonial mansions, there are few American cities that can compare with it in charm. It was a charm that Longfellow felt keenly all his life, and in his poems there are more than a few direct or indirect references to "the beautiful town that is seated by the sea," and to the fresh, fair domes of Deering's Woods. There he learned to love the sea, and there he saw and became familiar with the sea in all its Protean phases. There he became familiar with ships, and with seamen from strange lands. These and a thousand other details his poetic soul took in, even in childhood, inclining him resistlessly to poetry and romance.

He did not follow his father and grandfather to Harvard College, but went to old and honored Bowdoin, in the State of Maine. There he was graduated a Bachelor of Arts in 1825, when he was only eighteen years old. In college he was a fine student, particularly excelling in language and literature, and during his under-graduate days he wrote a number of poems which have been retained among his writings as of permanent value. Among these are the "Hymn of the Moravian Nuns," "The Spirit of Poetry," and "Sunrise on the Hills." These and other early poems were first printed in *The United States Literary Gazette.* He did not, however, at first contemplate a literary career, but after graduation entered his father's law office and began a course of legal studies. From that place he was soon called to the professorship of Modern Languages in his Alma Mater. To fit himself for such duties he went abroad and spent some time in France, Spain, Italy and Germany, pursuing philological studies, and also completed a course in the University of Göttingen. These early experiences in Europe also left deep marks upon his mind, and traces thereof are easily discernible in his poems. In 1829 he began the work of his professorship at Bowdoin. Two years later he married Miss Mary S. Potter, of Portland, a woman of much charm. She died a few years later, while travelling in Europe, and in 1843 he married again. His second wife was Miss Frances Elizabeth Appleton, daughter of Nathan Appleton, a prominent citizen of Boston. She was a woman of exceptional beauty of both body and mind, and a fitting companion for Longfellow, who was a singularly handsome man. She bore him five children, and then met a tragic death, through the burning of her clothing.

As Professor of Modern Languages at Bowdoin the poet was eminently successful, and the fame of his ability as an instructor became noised abroad. At the same time he won much favorable notice as a writer for *The North American Review* and other publications. His writings included both prose and poetry. One of his early efforts was a translation from the Spanish of "Las Coplas de Don Jorge Manrique," a scholarly and beautiful piece of work. He accompanied it with an essay on Spanish poetry. In 1835, when only twenty-eight years old, he published his delightful "Outre Mer," in two volumes, the story of his travellings in Europe. During the next twenty years more than 7,000 copies of it were sold, a phenomenal sale for such a book in those times. Better still, it won high critical commendation. *The Athenaeum*, perhaps the foremost literary journal of London, said of it: "If Longfellow had come before Irving, his fame would be that of a founder of a school, so far as America is concerned, rather than one of the scholars." That was not so many years after Sydney Smith's scornful demand, "Who reads an American book?" Among those who were quick to appreciate Longfellow's genius was George Ticknor, the Professor of Modern Languages at Harvard College. He paid a high tribute to Longfellow's translations from the Spanish, and proved his faith in the young poet and professor by recommending him to be chosen as his own successor at Harvard when he retired in 1836. This call was extended to Longfellow, and was accepted. He at once went abroad, early in 1836, to prepare himself with further study. His wife, who accompanied him, died at Rotterdam, but he continued his journey, seeking to find in hard study solace for his grief. In October he returned home and entered upon his professorship at Harvard, in which place he remained for seventeen years. Three years after settling at Harvard he published "Hyperion: A Romance," a story of personal experiences and marked with a fine mingling of pathos and gentle humor—two qualities which were woven together all through the poet's life and works.

Meantime he had been writing many poems, which were published in that rich treasury of American literature, *The Knickerbocker Magazine*, and elsewhere, and in 1839 he published a collection of them in a volume, entitled "Voices of the Night." Probably no other such book of American poetry was at once so favorably received. It sprang into instant popularity, and some of its contents have from that day to this been familiar as household words throughout America, and indeed throughout the English-speaking world. Scarcely one of these poems is marked with much originality, or with the supreme touch of genius. But they have the faculty of speaking directly to the heart. The human element in them is convincing and irresistible. Two years later appeared a second volume of poems, in which were "The Wreck of the Hesperus," "The Skeleton in Armor," and "The Village Blacksmith." In 1842 appeared a third volume, chiefly of anti-slavery poems, and in 1843 "The Spanish Student," a poetical drama. Of the last-named work a distinguished critic, Edwin P. Whipple, has said that "none of Longfellow's other pieces so well illustrates all his poetical qualities. It seems to comprehend the whole extent of his genius."

Longfellow paid another visit to Europe in 1842, and spent the summer at Boppard, on the Rhine. Some of the fruits of this visit appeared in his next volume of poems, in 1846, which contained "The Belfry of Bruges." Then, in 1847, appeared one of his greatest poems, and one which almost marked an epoch in American literature. This was "Evangeline: A Tale of Acadie." It was a narrative poem of considerable length, in English hexameters, of course without rhyme. It was not the first poem

ever written in English hexameters, but it was the first such poem to attain and to retain great popularity. Of its popularity and permanent fame there can be no question. For more than half a century it has been among the accepted masterpieces of American literature, and each year adds to rather than detracts from the esteem in which it is held. It has, it is true, been the subject of much controversy, and of some unfavorable comments. *The Athenæum* of London suggested that with the sorrows of its heroine "a simpler rhythm would have been more in harmony," and that "the real charm of the tale lay in its insulated pictures of scenery." There can be no question that it does contain some of the most perfect world-landscapes ever penned. But foreign critics generally hailed the poem as a beautiful composition, full of original charm indigenous to American soil. Dr. Felton, the eminent Greek scholar and critic, declared that in it Longfellow had shown "as perfect a mastery over the dactylic hexameter as anyone has ever acquired in our language."

At about the same time Longfellow wrote a delightful New England tale in prose, entitled "Kavanagh." Lowell, in *The North American Review*, called it a daguerreotype, so photographically exact a picture of New England life and manners did it present to his critical eye. In the same year appeared "The Seaside and the Fireside," another volume of minor poems, twenty in number. In 1851 appeared "The Golden Legend," one of his more important works, though not one of his most popular. In it, said Ruskin, the poet entered more closely into the temper of the monk, for good and for evil, than ever any theological writer or historian had done, even though they may have devoted their lives' labor to the task. Several other volumes of fugitive and minor poems were also published before the year 1854, which marked a new epoch in his life. In that year he resigned his professorship at Harvard, to be succeeded by James Russell Lowell, and thereafter devoted himself exclusively to literature. He continued, however, to make his home in the famous old Craigie House at Cambridge, which had formerly been Washington's headquarters, and which had already become one of the historic shrines of New England. After Longfellow's long residence there it became more noted and loved as his home than as the temporary home of the Father of His Country.

The fruits of this retirement from professional cares were soon apparent, and were most gratifying. In the very next year, 1855, appeared "The Song of Hiawatha: An Indian Edda," perhaps the best-known if not the most meritorious of all Longfellow's long poems. Its phenomenal popularity may be reckoned from the fact that ten thousand copies of it were sold within four weeks of its publication. It, too, met with all sorts of comments, chiefly, however, favorable and often enthusiastic. Its peculiar metre above all attracted attention and aroused comment. It consists of trochaics, rhymeless and without alliteration, but with innumerable repetitions of phrases. It did not take long for critics to discover that its style was very much like that of the "Kalevala," the national epic of Finland. The metre is the same, the repetition of phrases is the same, and the theme — the life and worship of the aborigines — is the same. To what extent Longfellow was indebted to the Finnish epic for his inspiration, it is impossible to say. To charge him with anything remotely resembling plagiarism would be absurd — as absurd as to charge Byron with plagiarism in adopting the Spenserian stanza for his "Childe Harold's Pilgrimage." Freiligrath declared "Hiawatha" to be written "in a modified Finnish metre, modified by the exquisite feeling of the American poet, according to the genius of the English language and the wants of modern taste." That was a just judgment. Longfellow was not the first to adopt this Finnish metre into English poetry. That had been done as early as 1827, by Sir John Bowring in an article in *The Westminster Review*. But as in the case of the hexameters, Longfellow was the first to make it popular, and to give it a permanent place in our literature. We may, indeed, doubt whether any other single poem, not excepting even Byron's, in the whole range of English literature, ever aroused more general interest immediately upon its appearance than did "Hiawatha." That was because partly of its metrical form, partly of its ethnological, philological and other qualities. It is indeed an almost inexhaustible mine of wealth for the antiquarian, the philologist, the historian, the naturalist, the painter, the sculptor, and, as we have recently seen, the musician. No poem in the world makes so varied an appeal to human interest. In Europe the poem was as widely noticed as here. John Bright quoted from it in a speech in Parliament. Cardinal Wiseman publicly praised it. Four months after its appearance in America, two German translations of it were published, one of them by Frederick Freiligrath. Whether fortunately or unfortunately, the style of the poem made it peculiarly susceptible to being parodied — a fate which it shared with most other great poems. *Punch*, of London, printed one of the most notable of these, in form an exact imitation of Longfellow's work, in substance a cordial eulogy of it. It has been estimated, with reason and judgment, that this poem has done more to instruct Americans in the folk-lore and traditions of the aborigines of the continent, than all other writings upon the subject put together.

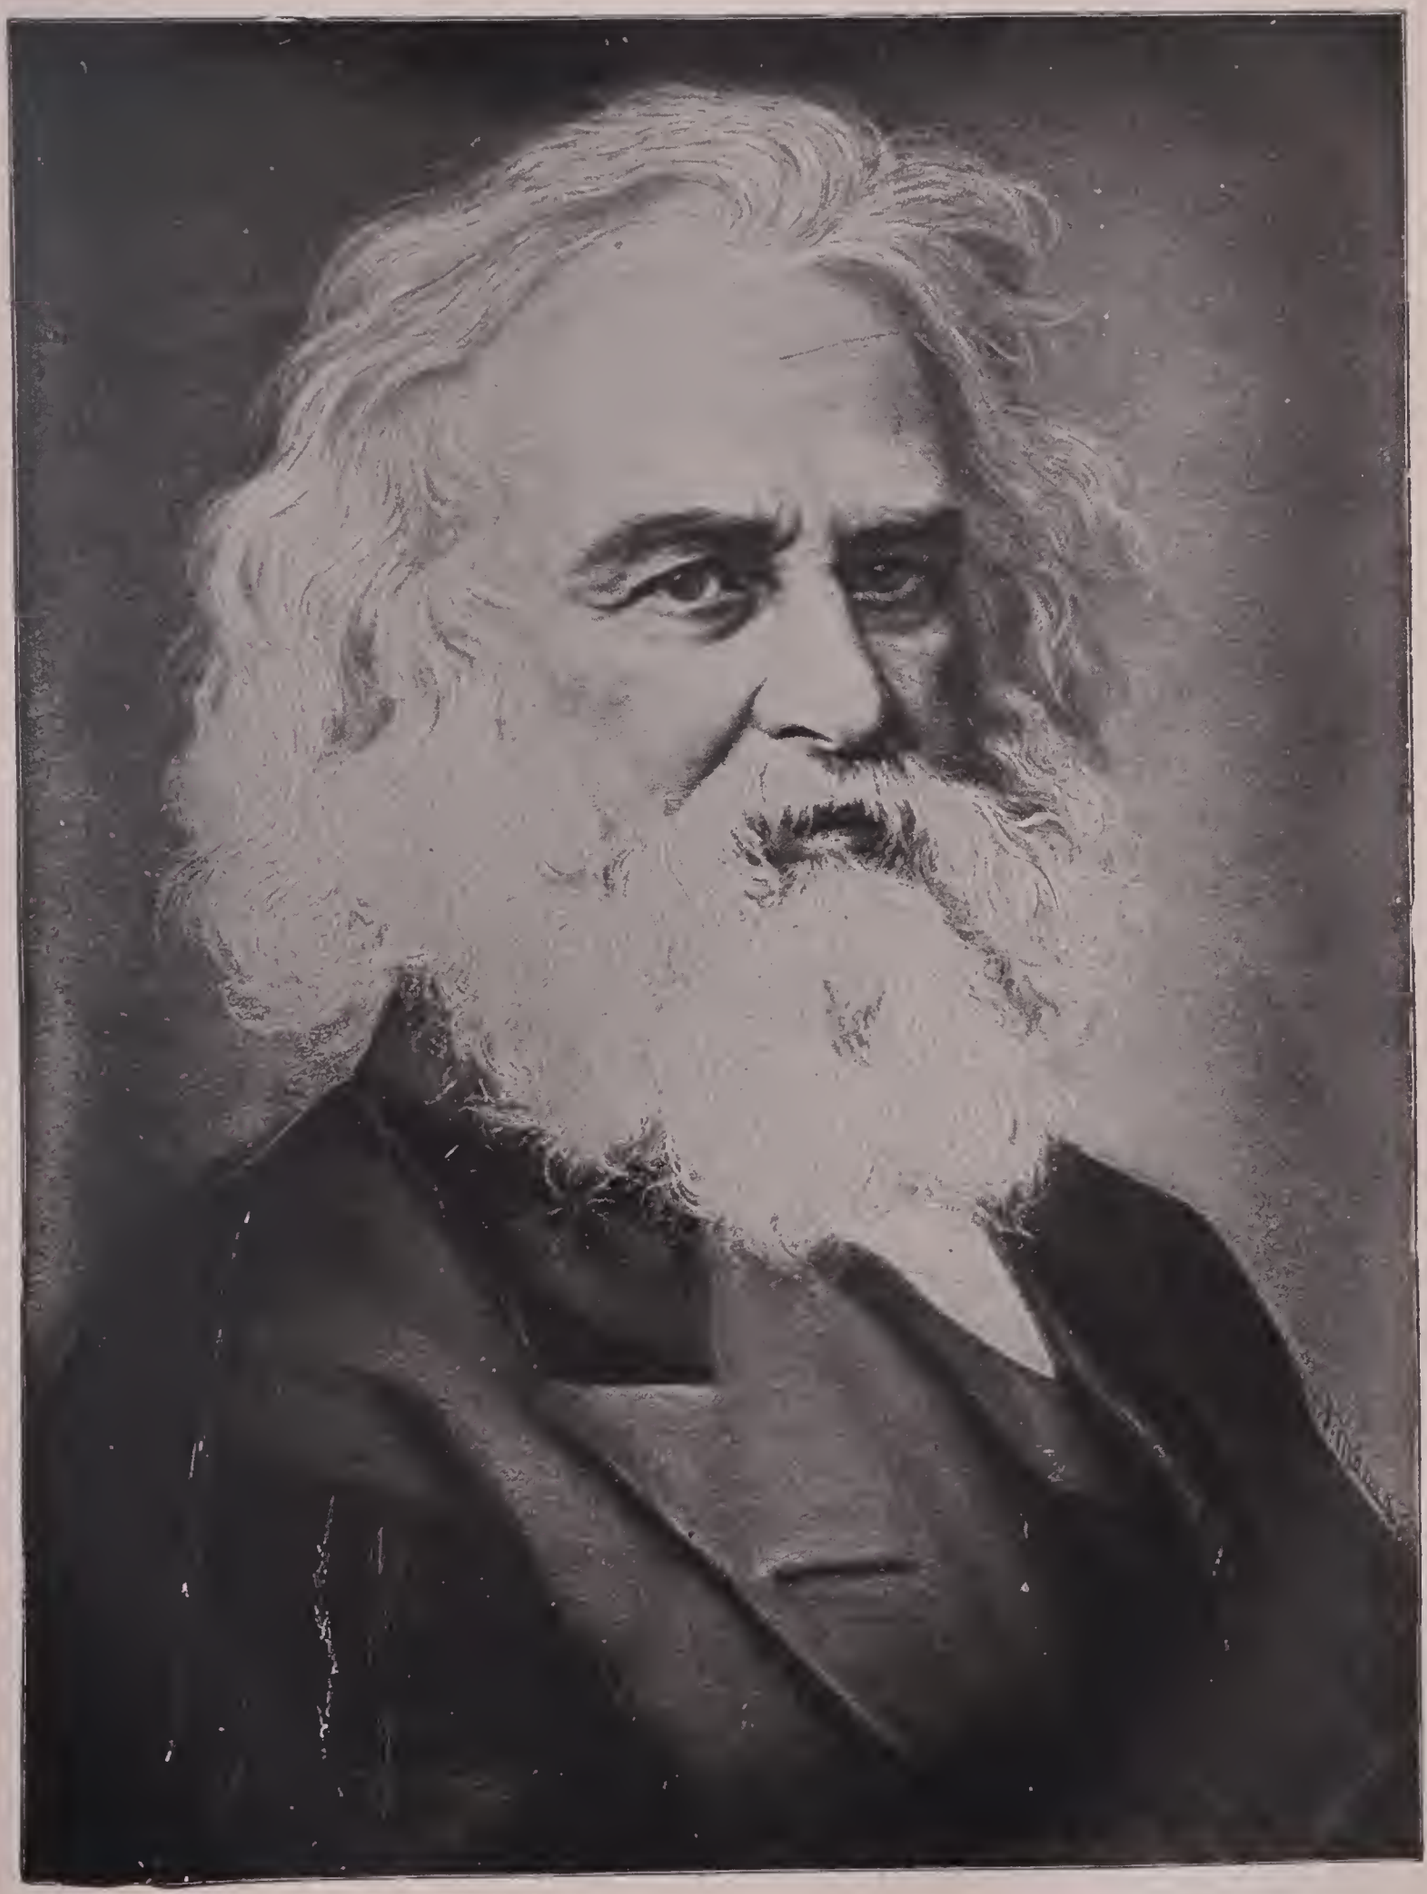
After this monumental production, the poet was well entitled to a rest. He did not lapse into idleness, however. In 1858 he published his "Courtship of Miles Standish," another poem in hexameters, scarcely inferior in execution to "Evangeline," and not inferior to it in popularity. In that he renewed his picturing of Indian customs, incidentally, as in "Hiawatha," and also and more especially his exquisite portrayal of early colonial times, as in "Evangeline," and his marvelous word-painting of scenes and scenery. The poem has a certain personal interest, too, arising from the author's own direct descent from John Alden, who shares with Standish the distinction of being the hero of the romance. The "Tales of a Wayside Inn," of which there are two series, appeared in 1863, and in them Longfellow displayed a fine blending of narrative, dramatic and lyrical power. One of the "Tales," "The Ride of Paul Revere," has long and deservedly been one of the most popular ballads in English literature, while "The Saga of King Olaf," the longest and most elaborate of the "Tales," stands unique and supreme as an unrivalled rendering of Scandinavian legends into varied English lyrics. "Flower de Luce" was published in 1867, and "New England Tragedies" a year later. Parts of the years 1868 and 1869 were spent in Europe, where he was received with distinguished honors wherever he went. The University of Oxford conferred upon him its most coveted degree, that of Doctor of Civil Law. The University of Cambridge had already given him that degree, and Harvard had given him that of Doctor of Laws. Numerous other seats of learning also bestowed upon him their highest academic honors.

None of these things, however, served to dull the keen edge of his creative zeal. He kept at work as earnestly in the triumph-crowned maturity of his career as ever when he was first struggling for recognition. He published "The Divine Tragedy," a sacred drama, in 1872, and a miscellaneous collection of poems entitled "Aftermath" in 1874. In 1867-70, also, he published a translation of Dante's "Divina Commedia" in English verse, which met with wide acceptance and elicited much favorable comment. Still another little volume of poems was entitled "Places." One of the most noteworthy of his later poems was "Morituri Salutamus," written for and read at the fiftieth anniversary celebration of the graduation of his class at Bowdoin, a simple yet majestic composition describing and discussing the advent of old age and exhorting his comrades, with himself, to maintain their activities to the last. In 1876 he wrote a poem on the centenary of the Declaration of Independence, which was published in *The Atlantic Monthly*, and ranked high among the Centennial literature of that year.

Thereafter his health and strength declined and he was able to do little. His last public appearance was on the occasion of the 250th anniversary of the settlement of Cambridge, Massachusetts, when he made, in Sander's Theatre, a brief address to the children of the public schools of that city. That was in December, 1880. In December, 1881, he was stricken with a severe attack of vertigo, which left him much enfeebled, though occasionally able to go out of doors. On March 18, 1882, he ventured to go out for a time, and became chilled in the cold, raw air which then prevailed. That night he was seized with a fever and much pain. Two days later peritonitis was developed, accompanied with bronchitis, and he steadily sank. On the afternoon of March 24 he died. He was surrounded at the end by his five children, Alice, Anna, Edith, Ernest, and Charles; his nephews, William T. and Wadsworth Longfellow; his brother, Alexander K. Longfellow; his sister, Mrs. James Greenleaf; and his brother-in-law, Thomas Appleton. His funeral took place on March 26. The services were held in the house which had so long been his home, and were conducted by his brother, the Rev. Samuel Longfellow, of Portland. Among those who gathered around his bier were Ralph Waldo Emerson, Oliver Wendell Holmes, George William Curtis, and many other eminent men and women. His tomb is in Mount Auburn cemetery, commanding a fine view of Cambridge.

There are few characters in the literary history of the world upon which it is so pleasant to reflect as that of Henry Wadsworth Longfellow. His physical personality was singularly attractive. In face and form he realized as nearly as one can hope to do the ideal of manly beauty, grace and strength. In his later years, with snowy hair and beard, with luminous eyes, and with a smile of unfailing loveliness, he presented at once an aspect of patriarchal kindness and Homeric grandeur. There was never a man who could at once command more respect and awe, and also confidence and love. His voice was sweet and musical, and his whole manner engaging in the highest degree. These qualities were effectively marked and exercised during his long professorship at Harvard. In those days college undergraduates were no respecters of persons, and would often display insubordination and disrespect toward their preceptors. Longfellow did not cultivate close relations with them. He seldom invited any of them to his house. His attitude toward them was one of unfailing courtesy but also of dignified reserve. In an exceptional degree, however, above all his colleagues, he commanded their respect. It is related that on one occasion there was something like a rebellion in the college over some matter, and the President and other members of the faculty in vain tried to quell it. The students would not listen to them, but drowned their voices with angry or derisive cries. Finally Longfellow arose to speak. Instantly a hush fell upon the student mob. "Let us listen to Mr. Longfellow," said the ringleaders, "for he always treats us as gentlemen." It was remarked that he was one of the few college professors of his time who always, in the class room, addressed a student as "Mr." His scholarship and his rare ability to impart instruction also commanded the respect and admiration of the students. He was always lucid, suggestive, and encouraging. Under his direction the Department of Modern Languages at Harvard was developed into by far the largest and most efficient in America.

Attractive, too, was Longfellow in his intercourse with his fellows in the world of literature. He was singularly free from anything resembling jealousy or envy. There was no one else quite so ready and eager to encourage or assist a young and struggling writer, no one so quick and generous to commend worthy work. Doubtless he appreciated his own productions. He would have been unworthy to produce them had he not done so. He knew he was a man of rare genius. But never was there a hint of egotism or self conceit, but always a sweet and unaffected modesty and a readi-



HENRY W. LONGFELLOW

ness to listen to criticism. It is told, as characteristic of the man, that at the time of the publication of his "Village Blacksmith" he was one day having his hair trimmed in a barber's shop, and he repeated aloud to the barber a few lines of the poem; among them the beginning of the second stanza: "His hair is crisp and black and long." "But, Mr. Longfellow," protested the barber, "that isn't right. Hair that is crisp and black is never long." The poet was not displeased at the daring criticism, but accepted it as "expert testimony," thanked the barber for it, and immediately instructed his publishers to change the line, substituting "strong" for "long." The next day, however, he reconsidered the matter, and restored "long." In a note to the publishers he said: "I wrote you yesterday to have the word 'long' changed to 'strong' in 'The Village Blacksmith.' The word 'strong' occurs in the preceding line, and the repetition would be unpleasant. It had, therefore, better stand as it is, notwithstanding the hairdresser's criticism, which, after all, is only technical, for hair can be both crisp and long."

A noteworthy characteristic of the man was his love of children, which was fully matched by the love and confidence which he inspired in them. Many of his poems display this trait in a beautiful manner. It was characteristic that his last public appearance should have been to make an address to school children. His friend Professor Monti related an incident which showed in an attractive light this side of the poet's nature. One day Professor Monti was walking toward Longfellow's house, when he was accosted by a little girl, perhaps twelve years old, who asked him where the poet lived. He offered to show her and they walked together to the gate. Then the child inquired if it would be right for her just to step inside the gate, so that she could say she had been on the grounds of Longfellow's home. The Professor told her she might, and added: "Do you see that window yonder, at that side of the house? Well, if you walk around in front of it, you will probably see a white-haired gentleman sitting at that window, reading. That will be Mr. Longfellow." The child hastened to the spot indicated, in happy anticipation, while the Professor entered the house. He found Longfellow at the window, but with his back turned toward it. "Do turn around and look out of the window!" he cried to the poet; "there is a little girl out there who wants to see you very much!" Instead of merely looking out of the window, Longfellow instantly went to the door, called the child to him, took her by the hand, and then spent an hour in showing her his house and books and pictures, "the old clock on the stairs" of which she had read in one of his poems, and the chair which was given to him by the children of Cambridge. Thus the child was endowed with lifelong memories of the poet.

The chair just mentioned was a huge arm chair, made of the wood of a chestnut tree that overshadowed the old blacksmith shop on Brattle-street, which the poet had immortalized in his poem,

> "Under a spreading chestnut tree
> The village smithy stands;"

Upon a brass plate on the chair was this inscription: "To the author of 'The Village Blacksmith.' This chair, made from the wood of the spreading chestnut tree, is presented as an expression of grateful regard and veneration by the children of Cambridge, who, with their friends, join in best wishes and congratulations on this anniversary. February 27, 1877." It was the seventieth anniversary of the poet's birth. On February 27, 1882, the last birthday anniversary the poet lived to see, he was too feeble to have any celebration. Indeed he had always been averse to any public demonstrations in which he was expected to take part. But many schools throughout the country devoted the day to a study of his writings and to essays and addresses upon his character and life.

There is no poet in the whole range of English literature, save only Shakespeare, who is quoted so much as Longfellow, or whose words have so much become a part of the intellectual furnishing of the popular mind. "That," said his friend, the accomplished critic, James T. Fields, "is because he humanizes whatever he touches. His lyre has nothing alien to any soil. I have heard him quoted by an Armenian monk with a cowl, and sung at campmeeting on the hills of New Hampshire." The very origin of many of Longfellow's poems was typical of their character, or rather determined in advance what that character should be. Mr. Fields has related that the familiar "Psalm of Life" was written on a bright summer morning, at Cambridge, in July, 1838. The poet sat, as he wrote it, at a small table between two windows of his room, his own heart still shadowed with the gloom and crushed with the burden of his affliction in the death of his wife, and his eyes beholding the life and light and beauty of the world about him. It was a poem directly from his own heart, and it was treasured by him for a long time before he would give it to the world. For three-score years now it has been perhaps the best known and most frequently quoted of all his poems, and one of the most familiar in English literature. "The Light of the Stars" was composed on a summer evening whose serene beauty was exactly suggestive of the poem. So, says Mr. Fields, "The Wreck of the Hesperus" was written the night after a violent storm on the coast, and "The Skeleton in Armor" was composed after a stirring ride along the beach. The familiar "Excelsior" was suggested to him by the one word which forms its refrain. That word, printed in capital letters, caught his eye in a newspaper, and he quickly began to write the verses on the back of a letter of Charles Sumner's, which he chanced to have in his pocket.

The story of "Evangeline" was suggested to Longfellow by his friend Nathaniel Hawthorne. The incident was related by Longfellow himself, in the later years of his life, as follows:

"Hawthorne came to dine with me one day, and brought a friend with him from Salem. While at the dinner, Mr. Hawthorne's friend said to me: 'I have been trying to get Hawthorne to write a story about the banishment of the Acadians from Acadia, founded upon the life of a young Acadian girl who was then separated from her lover, spent the balance of her life searching for him, and when both were old found him dying in a hospital.' 'Yes,' said Hawthorne, 'but there is nothing in that for a story.' I caught the thought at once that it would make a striking picture if put in verse, and said, 'Hawthorne, give it to me for a poem, and promise me that you will not write about it until I have written the poem.'

"Hawthorne readily assented to my request, and it was agreed that I should use his friend's story for verse whenever I had the time and inclination to write it. In 1842 I started for Europe, and, when in New York, concluded I would visit Philadelphia, and so went over. It was in the spring about this time, and the country was as beautiful as it is to-day. I spent a week in the Quaker City, stopping at the old Mansion House on Third st., near Walnut. It was one of the best hotels I ever stopped at, and at that time perhaps the best in the country. It has been the private residence of the wealthy Brighams and was kept by a man named Head. The table was excellent, and the bed-chambers were splendidly furnished and were great, large, airy rooms. It has given way now to the demands of business, I believe, for when I was last there I could hardly recognize the place where it stood. During this visit I spent much time looking about, and Philadelphia is one of the places which made a lasting impression upon me and left its mark upon my later work.

"I got the climax of 'Evangeline' from Philadelphia, you know, and it was singular how I happened to do so. I was passing down Spruce st. one day toward my hotel after a walk, when my attention was attracted to a large building with beautiful trees about it inside of a high enclosure. I walked along until I came to the great gate, and then stepped inside and looked carefully over the place. The charming picture of lawn, flower-beds and shade which it presented made an impression which has never left me, and twenty-four years after, when I came to write 'Evangeline,' I located the final scene, the meeting between Evangeline and Gabriel and the death, at this Poorhouse, and the burial in an old Catholic grave-yard not far away, which I found by chance in another of my walks. It is purely a fancy sketch, and the name of Evangeline was coined to complete the story. The incident Mr. Hawthorne's friend gave me, and my visit to the Poorhouse in Philadelphia gave me the ground-work of the poem."

Edmund Clarence Stedman, the distinguished poet and critic, has called Longfellow "our poet of grace and sentiment." He was even more than that, as the same accomplished critic testifies. "His verse," says Mr. Stedman, "is peculiarly open to the test of Milton's requirement, that poetry should be simple, sensuous, passionate. Simple, even elementary, it manifestly is, despite the learning which he puts to use. It is sensuous in much that charms the ear and eye, and in little else; for the extreme of sensuousness is deeply felt, and feeling results in passion, and passionate the verse of Longfellow was not and never could be." No, but for that very reason it has a more universal appeal than the impassioned strains of a Shelley or a Keats, because the average human mind is incapable of appreciating exceptional passions. Sentiment is universal. Passion is exceptional. The poet of passion may appeal with irresistible stress to other poets and to the elect few. But the singer who would touch and move the universal heart must do so with the instruments which that heart understands. When Longfellow wrote such poems as "Resignation," "The Psalm of Life," "The Bridge," and a host of others, he struck not unusual chords that would cause the world to listen with wonder and amazement, but rather the common chords that vibrate in every human heart, and that thus woke in every heart responsive echoes. If universality of aptness constitutes a classic, Longfellow was the most truly classic of all our poets, and of all poets in the world since Shakespeare. He wrote a multitude of poems that ring as true at the antipodes as in New England, and that will be as timely and as vital in the ninetieth as they were in the nineteenth century.

We shall not err, then, if we consider Longfellow to have been the greatest of American poets, and one of the greatest poets in English literature. Such indeed has been the judgment of many competent and unbiased critics. Upon his death a writer in *The Standard* of London declared that "Longfellow commands a wider audience among our people than any poet of this age, save, *perhaps*,

Tennyson." *The Telegraph* of London, then edited by the distinguished poet Edwin Arnold, said: "He is almost as well known and widely read in England as in America. His influence has been wholly good. As long as the English language lasts his works will be quoted as models of simplicity of style and purity of thought. Death has taken America's greatest literary son." *The Observer* added: "It is scarcely too much to say that since the death of Byron no living English poet enjoyed so wide a popularity as Longfellow." These and innumerable other like judgments are year by year being corroborated and confirmed by the mature judgment of advancing time. The fact is, Longfellow's works have the enduring quality which is imparted by sanity and by sanity alone. There is nothing decadent, nothing exotic, nothing morbid about them. Few poets have given stronger expression to absolute anguish than he in his lines entitled "Weariness." But there is not in it, nor in any one of all his voluminous works, a single touch or hint of morbidness. Of that so-called genius which raves and defies the moral law and rushes into all manner of excesses, he had none. His was the genius that thought clearly and saw straight, and that sang, not with the poisoned frenzy of a Pythia in notes that none could understand, but with the sweet and limpid purity of the skylark facing the rising sun, in strains that went straight to the heart and to the understanding. Nor was it the least of his distinctions, or the least of his assurances of immortality, that he possessed in an exceptional degree a sympathy with youth. He lived to be old, surpassing the Psalmist's span of life. Yet never did his heart grow old. In many of his poems, from first to last, are inimitable touches of the freshness and buoyancy and indomitable hope of youth. Even in that surpassingly exquisite poem, "My Lost Youth," he does not brood upon the "sere and yellow leaf," but rather exults in finding his lost youth again. In the leafy domes of Deering's woods and the whispering waves that lap the shore at Portland, the magic of the olden days comes back to him.

> The song and the silence in the heart,
> That in part are prophecies, and in part
> Are longings wild and vain.
> And the voice of that fitful song
> Sings on, and is never still:—
> "A boy's will is the wind's will,
> And the thoughts of youth are long, long thoughts."

His writings were throughout instinct with the thoughts of youth, and they were and are long, long thoughts that will endure forever.

W. Fletcher Johnson.

May, 1904.

LONGFORD, an inland county of Leinster, Ireland, is bounded on the N. W. by Leitrim, N. E. by Cavan, E. by Westmeath, S. by Westmeath and Meath, and W. by Lough Ree and Roscommon. With the exception of Carlow, Louth, and Dublin, it is the smallest county in Ireland, its greatest length being about 28 miles, its greatest breadth about 20, and the total area comprising 269,409 acres, or about 421 square miles.

The general level surface of the country is broken occasionally by low hills, which cover a considerable area at its northern angle. The principal rivers are the Camlin, which rises near Granard, and flows past Longford to the Shannon, and the Inny, which, entering the county from Westmeath, crosses its southern corner, and falls into Lough Ree. Lough Ree is partly included in Longford, and the other principal lakes are Lough Gownagh, Derrylough, Lough Drum, and Lough Bannow. The Royal canal intersects the county. The southern division of the county, bounded partly by the Camlin, belongs to the great limestone plain of Ireland, and the northern division is occupied chiefly by clay-slate and graywacke. In the west of the county there is an interpolation, between the two divisions, of yellow sandstone and conglomerate. Isolated hills of sandstone occur at Slievegauldry and at Ballymahon, on both sides of the Inny. Marble of fine quality has been raised near Ledwithstown. In the north indications of iron are abundant, and there are also some traces of lead.

Agriculture.—The climate is somewhat moist and cold, partly owing to the large extent of marsh and bog. The soil in the southern districts resting on the limestone is a deep loam well adapted for pasture, but in the north it is often so thin and poor as to be incapable of reclamation.

In 1881 there were 74,876 acres under tillage, 125,838 pasture, 3697 plantation, and 51,333 waste. The total number of holdings in 1880 was 8682, of which 685 were less than 1 acre. More than one-half of the total number were included in those between 5 and 15, and 15 and 30 acres in extent, which numbered respectively 2482 and 2658. The following table shows the areas under the principal crops in 1855 and in 1881:—

	Wheat.	Oats.	Other Cereals.	Potatoes.	Turnips.	Other Green Crops.	Flax.	Meadow and Clover.	Total.
1855	2,253	38,841	328	16,258	2,730	936	262	20,156	81,764
1881	307	18,670	233	13,108	2,621	1,792	236	37,899	74,866

The total number of horses in 1881 was 6856, of which 4253 were used for agricultural purposes; of cattle 51,547, of which 16,212 were milch cows; of sheep, 24,140; of pigs, 17,900; and of poultry, 232,324. There were 3066 asses and 670 mules. According to the latest return, the land was divided among 436 proprietors possessing 256,668 acres, with an annual ratable value of £151,739, the average ratable value per acre being 11s. 10d. The average size was 588 acres, and 14 per cent. possessed less than 1 acre. The largest owners were Colonel King Harman, 28,779 acres; earl of Granard, 14,978; Lord Annaly, 12,160; George Maconchy, 10,319.

Manufactures.—These are confined almost entirely to coarse woollen and linen cloth.

Railways.—One branch of the Midland Great Western Railway skirts the eastern boundary of the county, and another passes through its centre to Longford.

Administration and Population.—The county includes 6 baronies, with 26 parishes and 891 townlands. It is in the north-west circuit. Assizes are held at Longford, and quarter sessions at Ballymahon, Granard, and Longford. There is one poor-law union wholly within the county, with portions of other two. It is in the Dublin military district and Birr subdistrict. There are barracks for infantry and cavalry at Longford. The county returns two members to parliament.

The only town of any importance is the county town, Longford. From 25,142 in 1760 the population of the county gradually increased till in 1841 it was 115,491, but since then it has diminished to 82,348 in 1851, 64,501 in 1871, and 61,009 in 1881, of whom 30,770 were males and 30,239 females. From 1st May, 1851, to 31st December, 1881, the number of emigrants was 40,726. For the ten years 1871–81 the marriage-rate per 100 of the population was 4, the birth-rate 24·3, and the death-rate 16. In 1881 23·1 per cent. of the population above five years of age were illiterate, the percentage in 1871 being 32. The Roman Catholics formed 91 per cent. of the population in 1881, and the Episcopalians 8. Population in 1901, 46,581.

History and Antiquities.—The early name of Longford was Analé or Annaly, and it was a principality of the O'Farrels. Along with the province of Meath, in which it was then included, it was granted by Henry II. to Hugh de Lacy, who planted in it an English colony. On the division of Meath into two counties in 1543, Annaly was included in West Meath, but in the 11th of Elizabeth it was made shire ground under the name of Longford, and included in the province of Connaught, from which it was transferred to Leinster in the 27th of the same reign.

The principal antiquarian ruin is the Danish rath called the Moat of Granard, at the end of the main street of the town, and occupying a position 593 feet above sea-level. There are monastic remains at Ardagh, Longford, Moydow, Clone, Derg, Druimchei, and Killinmore, as well as on several of the islands of Lough Ree. The principal old castles are those of Rathcline near Lanesborough, and Ballymahon, Burnacor, and Castlecor on the Inny. The principal modern seats are those of Carrickglass on the Camlin, and Castle Forbes, the seat of the earl of Granard. Oliver Goldsmith was born at Pallas, a village near Ballymahon, in this county.

LONGFORD, the chief town of the above county, is situated on the river Camlin, and on a branch of the Midland Great Western Railway, 75 miles west-north-west of Dublin. The principal buildings are the parish church in the Grecian style, St. Mell's Roman Catholic cathedral (one of the finest Roman Catholic churches in Ireland), the court-house, the market-house, and the county jail. Of the old castle and of the Dominican abbey there are slight remains. The town has a considerable trade in grain, butter, and bacon. There are corn-mills, a spool factory, and tanneries. The population in 1871 was 4375, and in 1901 it was 3,850.

The ancient name of the town was Athfada, and it is said to occupy the site of a monastery founded by St. Idus, a disciple of St. Patrick. The town obtained a fair and market from James I., and a charter of incorporation from Charles II., as well as the right to return two members to parliament. It was disfranchised at the Union.

LONGINUS, a philosophical critic of great eminence, and one of the brightest spirits of antiquity, uniting Greek subtlety with Roman fervor, flourished in the 3d century, and is known to have perished under sentence of the emperor Aurelian in 273 A. D. He forms one of the last brilliant cluster of pagan literati; and Porphyry, round whom it centred, was the pupil of Longinus. As Porphyry is known to have been born in 233, it is probable that his preceptor, who could not have been less than twenty years his senior, may have been born about 210 A. D. The main authority for the facts of his life is a notice in Suidas, where we find it stated in a preface to a list of his writings that "Longinus Cassius, philosopher, preceptor of Porphyry the philosopher, a learned scholar and critic, lived in the time of the emperor Aurelian, and was cut off by him as having conspired with Zenobia, the wife of Odenathus." From the same authority we learn that Phronto, the rhetorician of Emesa in Syria, was his uncle, and that Phrontonis, sister of Phronto, was mother to Longinus, who thus became heir to his uncle Phronto. As to his birthplace there is no tradition, but it is probable that he was a native of Syria, possibly of Emesa, to which his uncle belonged. He tells us, as we learn from fragments of his works, that he enjoyed great advantages in travel and education, that his parents, being rich, took him to travel and he saw much of the world, and that he studied at Athens under Phronto, at Alexandria under Ammonius Saccas and the pagan Origenes, and at Rome under Plotinus and Amelius. The Neo-Platonic philosophy was then in the ascendant, but Longinus did not embrace the new speculations which Plotinus was then developing, and continued a Platonist of the old type. Hence the sting of a sarcasm attributed to Plotinus—"Longinus may be a philologer, but he is no philosopher." Longinus does not appear to have reciprocated the sarcastic feeling, for we have still extant a fragment of a letter in which he asks Porphyry to come to Phœnicia and to bring with him the treatises of Plotinus, for, he observes, though he does not feel much attraction for the subjects, he yet likes the man. The reputation which Longinus acquired by his learning was immense; it was of him that Eunapius first used the expression that has since become proverbial "a living library"—in modern phrase, a walking encyclopædia.

The most conspicuous event of his life was also the most tragic in its consequences. He became secretary to Zenobia, the widowed queen of Palmyra, who acquired from him a knowledge of Greek, and made him her chief counsellor in state affairs. In this capacity he favored the policy by which she aimed at independence of the Roman empire, encouraged, doubtless, to do so by the recent fate of Valerian, and by the feebleness of the tenure by which Rome held the Syrian provinces. Aurelian, however, crushed the pretension, and, while Zenobia lost her power and was led captive to Rome, Longinus paid the forfeit of his life. According to Zosimus, Zenobia sought to exculpate herself with Aurelian by laying the whole blame on her adviser. He died bravely, not seeking to escape his fate by suicide as a Stoic might have done, but following the example of Socrates and the precept of Plato, to whose philosophy he adhered.[1]

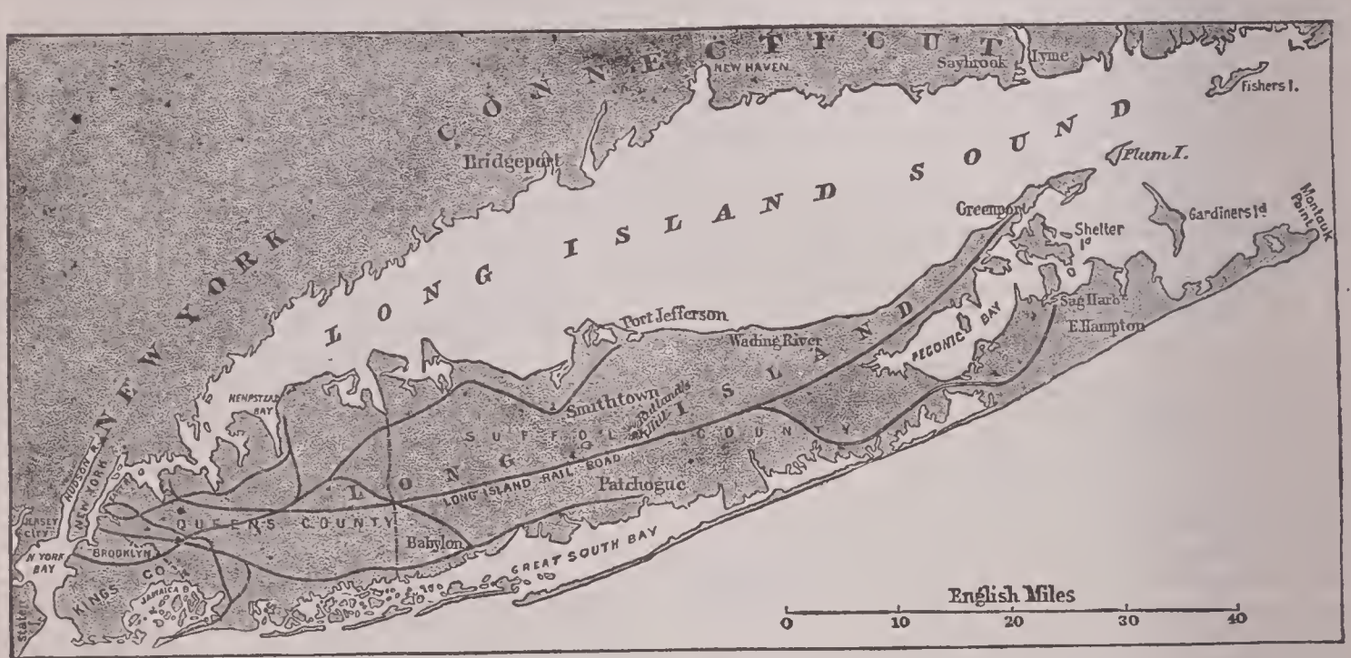
The remains of Longinus that have come down to us, unfortunately scanty, are partly fragments of letters and extracts from criticisms on points of diction; and they bear out the impression we derive from the historical notices of the man. He is vivid and yet minute, lively and penetrating, and his observations show taste, learning, and judgment. Among the most notable of the fragments we have a defence of the Platonic doctrine of the soul as a distinct essence from the body, which defines clearly his philosophical position.

It only remains to advert in a few words to the remarkable production called the *Treatise on the Sublime*, which has usually passed current as a work of Longinus. This remarkable work, which is among the most notable productions of ancient criticism, second only in importance to the *Poetics* of Aristotle, and superior to that work in luminous beauty and sense of form, cannot be with certainty ascribed to Longinus, although the internal evidence favors the usual ascription. Of the two most startling difficulties the first is the absence of any mention of a treatise περὶ ὕψους in the list by Suidas. The enumeration is, however, incomplete, and the phrase "many other works," with which it closes, may be held to cover much. A more formidable difficulty is the circumstance that in the most important manuscript (that in the Paris Library, No. 2036, of the 10th century (the heading is Διονυσίου ἢ Λογγίνου, giving thus an alternative author "Dionysius," and in the other important MS., the Laurentian at Florence, the title is Ἀνωνύμου, implying that the author was unknown. According to Vaucher (*Études*, p. 134) this title is not the original one, and there are traces of an earlier title Λογγίνου, which had formed the superscription. Full information as to the critical question will be found in the editions of A. E. Egger (*Longini quæ supersunt*, Paris, 1837). Vaucher's *Études Critiques sur le Traité du Sublime et sur les écrits de Longin*, Geneva, 1854, and Otto Jahn's Διονυσίου ἢ Λογγίνου περὶ ὕψους *de Sublimitate Libellus*, Bonn, 1867. Vaucher ascribes the treatise to Plutarch, but the evidence negatives that supposition, and, although there are difficulties in ascribing the work absolutely to Longinus, as Boileau and Gibbon and the critics of last century traditionally assumed, there is no other name than that of Longinus that presents so many concurring circumstances to justify provisionally the current ascription. The fragments that remain of the undoubted works of Longinus are largely characterized by the same lively force and epigrammatic terseness which distinguish the treatise, "On the Sublime." The translations of this treatise into all the European tongues have been almost innumerable, including the famous one by Boileau, which rendered the work the favorite text-book of the belle-lettristic critics in the last century. The most important English translations are by William Smith, 1739, frequently reproduced; Hathaway, 1834; Spurdens, 1836. (W. D. G.)

LONG ISLAND, an island with an area of 1682 square miles lying off the coast of the United States, between 40° 33′ and 41° 10′ N. lat., and forming part of the State of New York. While the length from east to west is about 120 miles, the width nowhere exceeds 24 miles, and in some places falls to 12 or 15. The western end is separated from the city and rest of New York by the East River, which is nowhere more than three quarters of a mile in breadth, and has been spanned by a great suspension bridge; but between the main body of the island and the mainland (Connecticut, Rhode Island) lies Long Island Sound, widening out to a breadth of 20 miles. The sound, however, is comparatively shallow, the depth in the eastern and seaward portion being usually under 200 feet, while in the portion west of Connecticut river it is nowhere more than 170 feet, and in general only 75–100 feet. Geologically the island is very interesting, consisting, as it does for the most part, of an immense morainal deposit of glacial drift. A range of hills extends with some interruptions for about 60 miles

[1] It is probable that he owed part of his political fervor to the influence or inheritance of the name "Cassius," from whatever source this surname was derived. The associations of this name were distinctly anti-imperial and even regicidal, as seen in Caius Cassius and in Cassius Chærea.

in the line of its longer axis, varying in height from 150 to 384 feet above sea-level. Fort Pond Hill for instance is 194 feet; Neapeague, 135; Amagansett, 161; Shinecock, 140; Osborn's Hill, near Riverhead, 293; Ruland's, south of Coram, 340; West Hills (Jane's Hill), 354; Layton's Hill, 380; Westbury, 260; Hempstead Harbor Hill, 384; John M. Clarke's Hill, 326. From the foot of the hills southward stretches a vast nearly level plain, with an average height of 70 feet, and consisting of post-glacial stratified sand and gravel; and across this run a large number of shallow parallel watercourses, remarkable mainly for the regularity with which they present an elevated bank on the western side and a long declivity on the eastern. On the northern side of the range the surface is very uneven, some of the elevations exceeding 200 feet, and deep fiord valleys stretching down to the sound, and forming a series of excellent harbors. The glacial drift of Long Island is of immense depth, and contains a wonderful number of boulders. "At the eastern extremity," says Lyell on the authority of Mather, "they are of such kinds of granite, gneiss, mica, slate, greenstone, and syenite as may have come across the sound from parts of Rhode Island. Opposite the mouth of the Connecticut river they are of such varieties of gneiss and hornblende slate as correspond with the rocks of the region through which that river passes. Still further west they consist of red sandstone and conglomerate and the trap of that country, and lastly, adjoining the city of New York, we find serpentine, red sandstone, and various granitic and crystalline rocks which have come from the district immediately to the north." One of the boulders near Manhasset measures 54 feet long and 40 feet wide, and rises 16 feet above the level of the soil. Of the numerous lakelets scattered throughout Long Island it is enough to mention Ronkonkoma, near Lakeland, the waters of which are said to decrease and increase in regular periods of four years. Much of the surface of the country is still covered with wood—oak, hickory, and chestnut growing freely on the unmodified drift, and pine forest extending for about fifty miles through the sandy plains. A good rich loam abounds in the northern districts, and the lighter soils of the south are easily rendered productive. Market gardening especially is carried on with success. The climate is comparatively mild, the mean annual temperature being 49° to 51°, the maximum for the



Map of Long Island.

year between 95° and 100°, and the minimum 4° to 8°. The average rainfall is about 42·1 inches. Towards its western end more especially, the northern coast of Long Island presents a number of important bays—Glen Cove, Oyster Bay, Huntington Bay, Smithtown Bay, etc.; the western extremity is deeply bifurcated by a very irregular inlet, broken up by various islands into Gardiner's Bay, Little Peconic, and Great Peconic; and along a large part of the southern coast stretches a remarkable series of lagoons, formed by a line of dunes varying in breadth from ¼ to 1 mile, and connected at various points with the ocean. These last—of which the most important is Great South Bay, 40 miles long by about 5 or 6 miles wide—are of great service to the island, and an Act has been passed to increase their utility by connecting them by canals. Coney Island and Rockaway Beach, the most frequented of the many seaside resorts in the Island, lie near the south-western extremity. As regards both birds and fishes, Long Island seems a kind of meeting place between the arctic and the equatorial species. In winter, for instance, it is visited by the eider-duck, the little white goose, the great cormorant, and the auk, in summer by the turkey-buzzard, the swallow-tailed kite, and the fork-tailed flycatcher. A few deer are still to be found; and various tracts of country and islands in the great bays are stocked with game and fish by sportsmen's clubs. The east portion of the island is one of the chief seats of the menhaden fisheries, and the oyster beds of both the north and the south coast are of great value. Those of the Great South Bay (furnishing, amongst others, the famous "blue points") alone give employment in the season to 1500 fishermen. (See E. Ingersoll, "The Oyster Industry," in the *Tenth Census* publications of the United States, 1881.)

Administratively Long Island consists of King's County (72 square miles), Queen's County (410), and Suffolk (1200), which in 1880 had the following population:—

	Total.	Male.	Female.	Native.	Foreign.	White.	Colored.
King's	599,549	289,289	310,260	411,295	188,254	590,278	9,271
Queen's	90,547	45,760	44,787	68,556	21,991	86,707	3,840
Suffolk	53,926	26,759	27,167	48,319	5,607	51,473	2,453

Of the thirteen or fourteen Indian tribes living in the island at the time of its discovery, the only remnants are about fifty Shinecocks and Montauks.

Besides Brooklyn, which had 566,689 inhabitants, King's County contained Flatbush town, 7634; Flatlands town, 3127; Gravesend town (including Coney Island village), 3676; New Lots town, 13,681; and New Utrecht town, 4742. In Queen's County are Flushing town, 15,919; Hempstead town (including East Rockaway, Garden City, and sixteen other villages), 18,160; Jamaica town, 10,089; Long Island City, 17,129; Newtown town, 9798; North Hempstead town, 7562; and Oyster Bay town, 11,923. In

Suffolk there are no cities, and none of the villages have 500 inhabitants. The "towns" are Babylon, Brookhaven, East Hampton, Huntington, Islip, Riverhead, Shelter Island, Smithtown, Southampton, and Southold. Garden City was built by A. T. Stewart as a model suburban settlement, and contains a fine cathedral. Hicksville is associated with the memory of Elias Hicks the Quaker missionary. Sag Harbor was formerly a great whaling station, and still maintains a good coasting trade. Five miles from Flushing is Creedmoor rifle range, the finest in the United States. On Gardiner's Island the pirate Kidd concealed the treasures partly recovered by the governor of Massachusetts in 1699. Population in 1900, 1,397,163.

Long Island was so called by its Dutch discoverers in 1609, and the name Nassau, bestowed in 1693 by the colonial legislature, never found popular acceptance. Breucklen (Brooklyn), Amersfoort (Flatlands), Vlissingen (Flushing), Rusdorf (Jamaica), and New Utreeht were founded by the Dutch between 1630 and 1654; and between 1640 and 1665 the English from the New England colonies established Southold, Southampton, Easthampton, Hempstead, Huntington, Oyster Bay, Smithtown, Islip, etc. Though the charter granted by James I. in 1620 expressly excluded territory actually possessed or inhabited by any other Christian prince or state, the grantees in 1635 conveyed to the earl of Stirling among other lands the island of Matowacks or Long Island. A treaty concluded between Dutch and English at Hartford (Connecticut) in 1650 surrendered to England all the land south of Oyster Bay; but, though it was ratified by the states-general of Holland in 1656, no action was taken by the English Government. Long Island was included in the territory assigned to the duke of York in 1663–64, and in 1664 an English squadron conquered the Dutch in time of peace, and set up a government in the duke's name. When the Dutch governor, who had recovered New York in 1673, issued a proclamation requiring the submission of the Long Island towns, they all obeyed except the three most eastern; but the treaty of Westminster in 1674 left Long Island to the English, and it became a regular colony of the crown. In the beginning of the war of American independence, Long Island naturally played a prominent part. The efforts made by Washington to defend it were frustrated by the British under Cornwallis in 1776, and it remained in their hands till the close of the contest.

LONG ISLAND CITY, a city of the United States, the capital of Queen's County, New York, situated on the west coast of Long Island, and separated from New York by the East River and from Brooklyn by the Newtown Creek. The area, which includes what were the post villages of Astoria, Newtown, and Ravenswood, measures 3 miles from east to west and 5 miles from north to south, and the general plan of the place is constructed on a spacious scale. The river frontage extends to about 10 miles. Hunter's Point, as the south-west portion is called, contains the terminal depôts of several railway lines, extensive warehouses for the storage of petroleum, and a variety of industrial establishments—such as granite-works, chemical works, engine-works. In the Astoria district there are factories for pianos, carriages, and carpets. Long Island City dates from 1870; in 1874 its population was about 16,000, and in 1900, 30,506.

LONGITUDE. See GEOGRAPHY (MATHEMATICAL) and TIME.

LONGOMONTANUS, or LONGBERG, CHRISTIAN (1562–1647), a Danish astronomer, was born at Longberg, a village of Jutland, in Denmark, on the 4th of October, 1562. Having, when only eight years old, the misfortune to lose his father, who was only a poor laborer, he was taken charge of by a maternal uncle, through whose influence he received lessons from the clergyman of the place. Although, owing to the poverty of his parents, the instruction which he had received up to this time had been of the most elementary kind, his aptitude for learning was so great that, under the tuition which he now received, he made rapid progress in his studies, especially in the mathematical sciences, for which he acquired an intense liking. His mother, however, was unable to pay any longer for his education, and he was reluctantly compelled to return home to work in the fields. By improving every opportunity which his laborious life now permitted, he was still enabled to pursue, to some extent his favorite studies. This state of matters continued for some time; but his intense thirst for knowledge, and the uncalled-for jealousy of his friends, led him in 1577 to steal away from home, to try his fortune in the world. Accordingly, at the age of fifteen, he went to Wiborg, a town about 12 miles distant from his native village. There he spent eleven years, dividing his time between attending the lectures of the professors in the college of that town, and working in the fields. By this means he was able not only to earn a sufficient livelihood, but also to defray the expenses of his education; and his close application to study soon enabled him to acquire considerable knowledge of literature and of the sciences. In 1588, at the age of twenty-six, he removed to Copenhagen, where his great abilities speedily secured for him the esteem and admiration of the professors in the university of that town. By this means he was brought under the notice of the eminent astronomer Tycho Brahe, who received him very kindly, and ultimately appointed him his assistant. He remained with Tycho Brahe for eight years in the island of Hoene, and during that time rendered him such valuable services in his astronomical observations and calculations, that, when Tycho Brahe settled in Germany, he invited Longomontanus to accompany him. This offer he accepted; but having shortly afterwards expressed to Tycho Brahe his desire to return to his native country, the latter at once furnished him, not only with excellent testimonials, but also with money for his journey. On his return to Denmark he made a long detour in order to visit the places whence Copernicus had made his celebrated astronomical observations. On his arrival at Copenhagen, he found a patron in the person of Christian Friis, chancellor of Denmark, who gave him employment in his household. He continued in this situation till 1603, when he received the appointment of rector of the college of Wiborg. Two years later (1605) he was elected to the chair of mathematics in the university of Copenhagen. This appointment he held till his death, on the 8th of October, 1647. Longomontanus, although one of the best astronomers of his age, inherited some of its worst prejudices. A firm believer in astrology, he held, among other things, that comets were messengers of evil. He also imagined that he had squared the circle. He found that the circle whose diameter is 43 has for its circumference the square root of 18252,—which gives 3·14185 . . . . . for the value of π. Pell and others endeavored to prove that he was mistaken, but they failed to convince him of his error. He refers to his imagined discovery in almost all his published works, and defends his position with great zeal.

The following is a list of his more important works in mathematics and astronomy, with the dates of their first publication:—*Systematis Mathematici*, etc., 1611; *Cyclometria e Lunulis reciproce demonstrata*, etc., 1612; *Disputatio de Eclipsibus*, 1616; *Astronomia Danica*, etc., 1622; *Disputationes quatuor Astrologicæ*, 1622; *Pentas Problematum Philosophiæ*, 1623; *De Chronolabio Historico, seu de Tempore Disputationes tres*, 1627; *Geometriæ quæsita XIII. de Cyclometria rationali et vera*, 1631; *Inventio Quadraturæ Circuli*, 1634; *Disputatio de Matheseos Indole*, 1636; *Coronis Problematica ex Mysteriis trium Numerorum*, 1637; *Problemata duo Geometrica*, 1638; *Problema contra Paulum Guldinum de Circuli Mensura*, 1638; *Introductio in Theatrum Astronomicum*, 1639; *Rotundi in Plano*, etc., 1644; *Admiranda Operatio trium Numerorum 6, 7, 8*, etc., 1645; *Caput tertium Libri primi de absoluta Mensura Rotundi plani*, etc., 1646.

LONGUEVILLE, ANNE GENEVIÉVE, DUCHESSE DE (1619–1679), who played the greatest part in the troubles of the Fronde, and whose name has come down to posterity as the brilliant intriguer in politics in her early and the pious protectress of the nuns of Port Royal in her later years, was the only daughter of Henri de Bourbon, Prince de Condé, and his wife Charlotte Marguerite de Montmorency, and the only sister of Louis, the great Condé. She was born on August 28, 1619, in the prison of Vincennes, into

which her father had been thrown for opposition to Marshal D'Ancre. the favorite of Marie de'Medici, who was then regent in the minority of Louis XIII. She was educated in the convent of the Carmelites in the Rue St. Jacques at Paris, which had been recently established under the influence of St. Teresa's reforms by nuns of the strictest piety, whose teaching she never entirely forgot. Her early years were clouded by the execution of the young and brilliant Duc de Montmorency, her mother's only brother, for intriguing against the great Richelieu in 1631, and that of her mother's cousin the Comte de Montmorency Boutteville for duelling in 1635; but, in spite of their sorrow, her parents made their peace with Richelieu, and when she was introduced into society in 1635 she found plenty of court gayety to enjoy. She soon became one of the bright particular stars of the Hôtel Rambouillet, where all that was learned, witty, and gay in France used to assemble, and which had not yet degenerated into the meeting place of those *précieuses* whom Molière was to laugh out of existence. It was first proposed to marry her to the young Prince de Joinville, and thus unite the Guises and Condés, but he died in 1639, and her parents could only find for her husband the Duc de Longueville, a prince of the blood indeed, and governor of Normandy, but a widower, and twice her age. The marriage could not be a happy one, but the young duchess long remained faithful to him, and bore him four children. After Richelieu's death her father became chief of the council of regency during the minority of Louis XIV., her brother Louis won the great victory of Rocroy in 1643 (see CONDÉ), and the duchess became of political importance. In 1647 she accompanied her husband to Münster, where he was sent by Mazarin as chief envoy, and where she charmed the German diplomatists who were making the treaty of Westphalia, and was addressed as the "goddess of peace and concord." On her return she fell in love with the Duc de la Rochefoucauld, the author of the *Maxims*, who made use of her love to obtain influence over her brother, and thus win titles and honors for himself. She was the guiding spirit of the first Fronde, when she brought over Armand, Prince de Conti, her second brother, and her husband to the malcontents, but she failed to attract Condé himself, whose loyalty to the court overthrew the first Fronde. However, La Rochefoucauld won the titles he desired. The second Fronde was again her work, owing to her lover's disgust at losing his new honors, and in it she played the most prominent part in attracting to the rebels first Condé and later Turenne (see CONDÉ). It is not necessary to give the whole history of the wars of the Fronde, which is detailed elsewhere, but it must be noticed that the duchess herself only mingled in politics to please her lover, and gain his ends. In the last year of the war she was accompanied into Guienne by the young and handsome Duc de Nemours, her intimacy with whom gave La Rochefoucauld an excuse for abandoning her, and who himself immediately returned to his old mistress the Duchesse de Chevreuse. Thus abandoned, and in disgrace at court, the duchess betook herself to religion. She accompanied her husband to his government at Rouen, and devoted herself to good works. She took for her director M. Singlin, so famous in the history of Port Royal, and from that time began her new religious life. Till 1663 she chiefly lived in Normandy, when her husband died, and she came to Paris. There she became more and more Jansenist in opinion, and her piety and the remembrance of her influence during the disastrous days of the Fronde, and above all the tender love her brother, the great Condé, bore her, made her a conspicuous figure. The king pardoned her, and in every way showed the respect he had for her. She became the great protectress of the Jansenists; it was in her house that Arnauld, Nicole, and De Lane were protected; and to her influence must be in great part attributed the release of De Sacy from the Bastille, the introduction of Pomponne into the ministry and of Arnauld to the king. Her famous letters to the pope are part of the history of PORT ROYAL (*q. v.*), and as long as she lived the nuns of Port Royal des Champs were left in safety. Through the latter years of her life she had, despite the honor in which she was held, much to bear. Her eldest son resigned his title and estates, and became a Jesuit under the name of the Abbé d'Orleans, while the younger, after leading a very debauched life, was killed, bravely leading the attack in the passage of the Rhine in 1673. As her health failed she devoted herself more and more to religion, and hardly ever left the convent of the Carmelites in which she had been educated. On her death in 1679 she was buried with great splendor by her brother Condé, and her heart, as she had directed, was sent to the nuns of that Port Royal des Champs which she had so greatly protected and defended. Her life is noteworthy, both from the harm she did in the turbulent days of the Fronde, though she acted, hardly knowing what she did, from love rather than from selfish ambition, and also from the greatness of her penitence, when her protection of Port Royal more than redeemed her fame, and gave her a title to the grateful remembrance of all who reverence true piety and learning more than the artificial glitter of the reign of the "grand monarque."

The chief authority for Madame de Longueville's life is a little book in two volumes by Villefore the Jansenist, published in 1738. Cousin has devoted four volumes to her, which, though immensely diffuse, give a vivid picture of her time. Her connection with Port Royal should be studied in Arnauld's *Memoirs*, and in the different histories of that institution.

LONGUS, the Greek romancer. Nothing is known of the life of the author of *Daphnis and Chloe*, and it is only inferred from some apparent imitations of the *Æthiopica* of Heliodorus that he wrote after the time of Theodosius. He may therefore be placed in the 5th century. His position in literature is interesting and not unimportant; he represents the romantic spirit of expiring classicism, the yearning of a highly artificial society for primitive simplicity, and the endeavor to create a corresponding ideal. The little idyl in the seventh oration of Dion Chrysostom is a beautiful example of this tendency three centuries before Longus, and the letters of Synesius, nearly in his own day, attest a genuine feeling for nature and a country life. In its literary aspect, nevertheless, this movement has little in common with the return to pure nature which inspired a Wordsworth, or the realism of George Sand's delineations of the peasantry of Berri. Longus's style is rhetorical, and his shepherds and shepherdesses are wholly conventional. It is no small credit to him to have achieved so purely ideal a delineation with so little apparent affectation, and without any of the tediousness of almost all modern pastoral writers. If unable to blend the reality and ideality of the pastoral life as Shakespeare has done in *As You Like It* and *The Winter's Tale*, he has nevertheless imparted real human interest to a purely fanciful picture, and shows no little knowledge of human nature in his delineation of the growth of a passionate attachment between two innocent children. Daphnis and Chloe were probably the prototypes of Paul and Virginia; and, notwithstanding the naiveté of some details, the Greek has a decided advantage over the Frenchman in the simplicity and sincerity which constitute the true modesty of nature. As an analysis of feeling, *Daphnis and Chloe* makes a nearer approach to the modern novel than its chief rival among Greek erotic romances, the *Æthiopica* of Heliodorus, where the attraction mainly consists in the ingenious succession of incidents.

Longus has found an incomparable translator in Amyot, bishop of Auxerre, whose French version, as revised by Paul Louis Courier, is better known than the original. It appeared in 1559, thirty-nine years before the publication of the Greak text at Florence by Alamanni. The chief subsequent editions are those by Jungermann (Hanau 1603), Villoison (Paris, 1778, which first gave a standard

text), Courier (Rome, 1810, the first entirely complete edition), Seiler (Leipsic, 1835), and Piccolos (Paris, 1866), pronounced by M. Pons the *ne p'us ultra* of accuracy. Pons's account of the literature and bibliography of the subject, appended to his edition of Courier's version (1878), is very careful and complete. There are English translations by Thornley, Craggs, and Le Grice, the last with omissions. The illustrated editions, generally of Amyot's version, are very numerous, and some are very beautiful. Prudhon's designs are especially celebrated.

LONS-LE-SAULNIER, capital of the department of Jura, France, is situated at a distance of 275 miles by rail from Paris, on the Vallière, a small tributary of the Saône, about 820 feet above the sea-level, at the point where the Besançon, Lyons, and Châlon-sur-Saône railways converge. It is pleasantly surrounded by vine-clad hills from 300 to 500 feet in height, consisting of lower spurs of the Jura chain. It owes its name to its salt-pits, which have been used from a very remote period; the large quantities of ashes derived from the wood burnt in the process of evaporation are extensively utilized in agriculture. Since 1839 there has been an establishment for the use of the mineral waters. The principal industry of the place is the manufacture of sparkling wines, the Étoile growth being the best for this purpose. There is also a foundry, in addition to printing establishments, tanneries, distilleries, brush factories, and manufactures of coverlets and carpets. About a mile to the west of the town are the salt-mines of Montmorot, employing one hundred and fifty workmen; the bed of rock salt, which lies at a depth of 400 feet, and is nearly 100 feet thick, yields about 9500 tons of pure salt yearly, 885 tons of sulphate of soda, and 300 tons of chloride of potassium. Lons-le-Saulnier possesses no buildings of special interest; one of the public squares contains a statue of Lecourbe, and there is a museum containing Gallo-Roman antiquities and various works of art. The library, which like the museum is in the town-hall, has 20,000 volumes. The population in 1901 was 10,306.

Lons-le-Saulnier, originally a Gallic town, was fortified by the Romans, destroyed by the barbarians, and, afterwards rebuilt and extended, belonged for a long time during the mediæval period to the powerful house of Châlon, a younger branch of that of Burgundy. It was burned in 1364 by the English, and again in 1637, when it was seized by the duke of Longueville for Louis XIII. It became definitively French in 1674. It was there that the meeting between Ney and Napoleon took place on the return of the latter from Elba, on March 31, 1815. Rouget de l'Isle, the author of the Marseillaise Hymn, was born at Montaigu near this town.

END OF VOLUME FOURTEENTH.

known as the Catholic Church, the body of Christians throughout the world who profess the same doctrine, partake of the same sacraments, and recognize the spiritual supremacy of the Pope, the Bishop of Rome. The subject may be treated most conveniently by considering, under separate heads, the doctrine, government, history, and statistics of this powerful and widespread religious organization.

1. Catholics believe that there is one God, in three divine persons,—Father, Son and Holy Ghost; that God, by his word only, and out of nothing, created heaven and earth and all things; that angels and men are the chief creatures of God; that some of the angels sinned and were punished; that Adam and Eve, the first man and woman, disobeyed the command of God, and were punished by the loss of justice and innocence, and by sickness and death; that this deprivation of justice is original sin, and all men are born with this defect or sin; that through the merits of her divine Son, and because she was to be his mother, the Blessed Virgin Mary was preserved free from this original sin, which privilege is called her Immaculate Conception. Catholics believe that God the Son, the second person of the Blessed Trinity, by the power of the Holy Ghost, assumed human nature of the Blessed Virgin Mary, and is called the God-man, Jesus Christ; that for this reason the Blessed Virgin Mary, although a creature, is called the mother of God, and is deserving of a very special, but not divine, honor,—divine honor being paid to God alone. They believe that Jesus Christ, by his suffering and death, redeemed men, and obtained for them grace, or supernatural help, whereby they may be saved; that the chief channels of grace are the seven sacraments, all of which were instituted by Christ; viz., Baptism, in which original sin, and actual sins committed before baptism is received, are forgiven; Confirmation, which makes those baptized strong and perfect Christians; Holy Eucharist, which is the sacrament of the body and blood, soul and divinity, of Jesus Christ, really present under the appearances of bread and wine; Penance, in which sins are forgiven which are committed after baptism; Extreme Unction, which is for the help and comfort of those in danger of death by sickness; Holy Orders, by which bishops, priests, and other ministers of the church are ordained and receive the power and grace to perform their sacred duties; Matrimony, which unites a Christian man and woman in lawful marriage, and gives them grace to live happily together.

Members of the Roman Catholic Church likewise believe that Jesus Christ, the true Son of God, instituted a church or society, and that to certain ones, i.e., the priesthood in this church, he intrusted the administration of the sacraments and the teaching of his doctrine divinely revealed; that the divinely appointed visible head of the church, the Pope of Rome (the invisible head is Jesus Christ) is, by the aid of the Holy Ghost, and must be, infallible; i.e., he cannot err, when officially teaching the whole church a doctrine regarding faith or morals. This, in their belief, does not imply that the Pope cannot sin, or make a mistake in other matters, as some non-Catholics have been led to suppose. Catholics also believe the will of God, is that all are bound to belong to the church, and he who knows the church to be the true church, and willfully remains out of it, cannot be saved. Such a person willfully disobeys God, and refuses the divine assistance necessary for salvation. Reasons of convenience, of prejudice, or of human respect, they say, God will not accept, nor will a sincere and intelligent man offer. While believing this in regard to the church, they are nevertheless not to be the judges of their fellow-men in regard to salvation, which finally depends on their interior dispositions, known only by God and by themselves.

Catholics also believe that as Jesus Christ is God, he can do all things, and particularly that he can forgive sins, and that he can change the substance of bread and wine into the substance of his body and blood. They believe, moreover, that, if he wishes, he can appoint men to do the same things in his name and by his power. They believe that, as a matter of fact, he has given this power to certain men, viz., to the priesthood of the church, and they prove this from Scripture and tradition to their satisfaction. They believe a man must be truly sorry for his sins, otherwise they will not be remitted, even though absolution be given; and they repudiate as an insult the charge that money, or any consideration, is received by priests for the forgiveness of sins. According to Catholic doctrine, an indulgence is a remission, in whole or in part, of the temporal punishment due to sin. It is not a pardon of sin, nor a license to commit sin, and one who is in mortal sin cannot gain an indulgence. Further, according to Catholic doctrine, the marriage of Christians is a sacrament, and cannot be dissolved by any court, but only by the death of either the husband or wife. The church forbids the marriage of Catholics with persons who have a different religion, or no religion at all, because such marriages generally prove unhappy, and lead to contentions or indifference, to loss of faith, and to the neglect of the religious education of the children. The removal of this prohibition is called a dispensation. Catholics maintain that all men are bound to believe the revelation of God and keep his commandments. They believe in heaven,—a state in which the good are rewarded eternally; they believe in hell,—a state to which the wicked are condemned eternally; they believe in purgatory,—a state in which those suffer for a time who die guilty of venial sins, or without having satisfied the temporal punishment due to their sins; they believe in a general resurrection of the dead, followed by a general judgment, after which purgatory will cease, and the souls of the just, reunited to their bodies, will be rewarded forever, and the souls of the wicked, also reunited to their bodies, will be punished forever. They, therefore, believe the salvation of the soul is the most important affair of life.

Catholics maintain that all of the doctrines of the church, of which the above is a synopsis, are contained in the revelation of God; that this revelation is found in the unwritten and the written Word of God, or in tradition and Scripture; that tradition finds its infallible expression in the teaching

church; that both are of equal value, in as far as they transmit the divine revelation, Scripture, because it contains and is the Word of God, inspired by the Holy Ghost to the sacred authors; tradition, because it is preserved from error by the assistance of the Holy Ghost. While, therefore, members of the Catholic Church revere and use the Bible, still they believe that the Scriptures alone do not contain all the revelation of God. They maintain, moreover, that the proximate rule of faith, given by God, and accessible to every one, is the teaching of the church, or the whole Word of God, both written and unwritten, and this as taught and explained by the church, through the organ of the successors of the apostles; that such is the establishment of Christ, and the practice since the first ages.

As a teaching body, in consequence of her articles of faith, the church is opposed to secret societies in which religion is travestied and belief in its supernatural quality destroyed or endangered, or in which conspiracies against civil and ecclesiastical authority are conceived or assisted, directly or indirectly. She forbids her members joining them. The church believes in the religious education of children, and hence, in the United States, because circumstances are such that religion is not taught in public schools, she has private and parochial schools, where both secular and religious instruction are given. She does not oppose the public schools, but, on the contrary, willingly acknowledges their opportuneness for the instruction of children whose parents are not of the Catholic faith. That temperance in all things is a cardinal virtue, is part of Catholic doctrine; hence, as a teaching body, the church can adopt neither extreme. She decries the great evils of intemperance and the saloon element on the one hand, but on the other she admits a licit use of both food and drink.

2. The government of the Roman Catholic Church is vested in its clergy, as distinguished from the laity. There is a growing tendency, however, especially in the United States, to give the laity a consultative voice, particularly in financial and school matters. The visible head of the church is the Pope. By virtue of his primacy he has full and supreme power of jurisdiction over the whole church, not only as the infallible teacher in questions of faith and morals, but also as the ruler in what pertains to the discipline and government of the church throughout the world. Hence he can examine and decide all ecclesiastical causes and receive appeals from all ecclesiastical tribunals. To him exclusively belongs the right of treating major causes, such as questions of faith, the erection of episcopal sees, the canonization of saints, the trial of bishops. Those who assist the Pope as ruler of the universal church make up what is called the Roman Court. This is composed of the Sacred College of Cardinals (see CARDINAL, in these Supplements), of several congregations of these same cardinals, of some other tribunals, and of those legates, vicars, administrators, who are called Apostolic,—that is, sent by the Apostolic See and fortified with its authority and jurisdiction.

The College of Cardinals is chosen by the Pope. All that is necessary is for the Pope to announce the name of a new cardinal. Failure to receive the insignia will not preclude a cardinal from participating in the conclave, which is a gathering of the cardinals for the election of a new Pope. Cardinals are now chosen from various countries, so that the ecclesiastical interests of all countries may be recognized, and the Pope have counselors throughout the world. According to present discipline there may be seventy cardinals, though really the number is optional with the sovereign pontiff. Six of these are cardinal bishops, fifty cardinal priests, and fourteen cardinal deacons. The cardinal bishops are the bishops of Ostia, Porto, Frascati, Sabina, Palestrina, and Albano, all in the vicinity of Rome. The cardinal priests are bishops or priests of dioceses throughout the world, who also have a church in Rome called their *title*. Cardinal deacons have each a deaconry in Rome, sometimes also called a title. The peculiar office of the College of Cardinals is to assist the Roman pontiff in ruling the universal church, and in case of vacancy in the Apostolic See, to assume the guidance of the church in necessary affairs until the election of a new Pope. These duties are performed by the cardinals as a body, not as individuals. The dignity of the cardinalate is, after that of the Pope, the highest in the church. It is greater than that of bishops, archbishops, primates or even patriarchs. Whether this precedence was obtained by cardinals only in the eleventh or twelfth century, or whether by right and in fact they always held it, is a controverted question. The Pope usually advises with the cardinals on important matters, though he is not bound to do so.

The method of selecting his successors is determined by the Pope. Whether he can choose his own successor is a controverted and delicate question. As a matter of fact, some popes have pointed out those whom they deemed best fitted to succeed them, but church history has no record of any supreme pontiff choosing his own successor, except Boniface II, in 529. The next year, however, he recalled his decree and declared it annulled. The selecting of the Pope has been different in different ages. In the first ages the election pertained to the priests and deacons of Rome. Later, the Roman people also bore testimony to the candidate's character. From the fifth to the eleventh century, emperors and kings usurped authority in the matter. In 1059 Pope Nicholas II made the cardinal bishops the sole electors of the pope, and in 1178 Pope Alexander III decreed that the election should pertain to all the cardinals, but to them alone. The secret conclave was introduced in 1274, and in 1740 the present method was perfected. A two-thirds vote is required to elect. The governments of France, Austria and Spain claimed the privilege of each excluding one objectionable candidate, but Pius IX, in three bulls published in 1871, 1872 and 1873, abolished this claim after the loss of the Papal States. Pope Leo XIII likewise has denied this privilege, though, as a matter of fact, the cardinals themselves, from motives of prudence, may respect these exclusions in future conclaves. Any man of any nationality, even a layman, may validly be

elected Pope, and as soon as he is elected and consents, he has full jurisdiction as the supreme pastor of the church. For some centuries, however, none but cardinals have been elected to the papacy. If the elected Pope is not yet a bishop, he is consecrated, by the dean of the Sacred College, the cardinal bishop of Ostia. During a vacancy, the dean of the Sacred College, the senior cardinal priest, and the senior cardinal-deacon, together with the camerlengo, assume the administration of the affairs of the Apostolic See for the College of Cardinals. A vacancy occurs through the death or resignation of the Pope, and until a new Pope is elected the pontifical jurisdiction is in abeyance, for the College of Cardinals, especially since the decree of Pope Gregory X in 1274 to that effect, can neither validly nor licitly exercise it, even by interpreted delegation.

In the first ages, the Pope advised with the Roman clergy, and later with the bishops of Italy, concerning the more important affairs of the church throughout the world. In time, the cardinals became his special counselors, and met with him nearly every day in consistory (see CONSISTORY, in these Supplements). But because of the mass of business which required extended examination, many cases were assigned to various committees and officials, and a number of permanent congregations and tribunals were instituted. At the present time, only the most important business is reserved for the consistory, which is called at the option of the Pope, and now meets only about twice a year. The congregations (see CONGREGATIONS, ROMAN, in these Supplements) are composed of several cardinals, assisted by officials and consultors, and have authority to hear and decide causes, both in the first instance, and on appeal from diocesan courts in the various countries of the world. When the Pope approves their finding, the decision is final, though sometimes a rehearing may be granted. Church matters referred to the Pope from dioceses in the United States, England, Ireland, Scotland, Canada, Australia, Holland, and missionary countries are sent to the Congregation of the Propaganda (see PROPAGANDA, in these Supplements). All business in the Propaganda is done gratuitously, even documents being furnished without charge. Most of the other congregations and tribunals collect specified fees for services. There are at least twenty congregations to which causes are referred, each having its specialty. Besides the congregations, there are three tribunals for affairs of justice, and three for hearing and granting petitions for favors. Appointments are made usually through the apostolic chancery, especially appointments of bishops. The secretary of briefs issues papers for favors of smaller moment, and the secretary of state attends to the diplomatic relations of the Holy See with countries having representatives at the Papal court. Nuncios and legates also receive instructions through this secretary, who is always a prominent cardinal. There are also various prelates attached to the Roman court, prothonotaries apostolic, domestic prelates, and chamberlains, who have rank throughout the world. Not a few such prelacies are honorary dignities conferred on priests away from Rome.

3. Apostolic legates, vicars, administrators, and missionaries are sent by the Holy See to various countries, either to hear and decide church controversies, or to preach the Gospel where it is not yet known. Thus in former times, St. Patrick was sent to Ireland, St. Augustine to England, St. Boniface to Germany. For a similar purpose, monks accompanied Columbus and Cabot in their voyages of discovery, and Marquette, Jogues and others preached to the Indians living near the Great Lakes. As soon as there is a sufficient number of Catholics, bishops are appointed to rule the church in a specified territory, called a diocese. Priests are by them appointed to preach and to administer the sacraments to the Catholic people of a specified territory, called a parish. It is the spirit and the policy of the Catholic Church that both bishops and priests be natives of the countries where they administer, and to this object the church in the United States especially is tending. For a similar reason, to preclude the necessity of appealing church controversies to Rome, there to be heard before one or another of the congregations, the Apostolic Legation was established in Washington, with power to hear and finally adjudicate many, if not all, questions of discipline arising in the Catholic dioceses of the United States. The legation also tends to insure unity of action and uniformity of discipline in the various dioceses, though they are governed immediately by their respective bishop or archbishop. The legation was established Jan. 24, 1893, and Monsignor Francis Satolli, titular archbishop of Lepanto, was appointed the first delegate apostolic. An auditor to examine cases and a secretary also were appointed. Nov. 29, 1895, Monsignor Satolli was made a cardinal, and after serving for eight months more as pro-delegate, was recalled to Rome. The apostolic delegation in Washington is ecclesiastical, not diplomatic.

The first Catholic bishop in the United States was Most Rev. John Carroll of Baltimore, appointed in 1790. Under him, at that time, were 20 priests and 30,000 lay people, scattered throughout the 13 states, but particularly in Maryland, Pennsylvania and the territory northwest of the Ohio. Most of these were native-born. Bishop Carroll's calculation makes the number 44,000. In 1803, with the annexation of Louisiana, 30,000 Catholics, born there, were added to the natural increase, so that in 1810 there were 90,000 native-born and 30,000 foreign-born Catholics. In 1830 the Catholics born in the United States had gained, by natural increase, 81,500, making 231,500 out of a total Catholic population of 361,000. In 1850 the Catholic population was about 1,876,470, of whom not more than 800,000 were from abroad. In 1860 the Catholic population was 3,000,000, of whom at least 1,701,470 were natives, the natural increase by births over deaths being at least 625,000. In 1870 there were 4,685,000 Catholics, of whom 2,786,470 were born in the United States. The total foreign-born population that year was 5,567,229, of whom 1,898,530 were Catholics. In 1880, out of 7,000,000 Catholics, 4,468,470 were native-born. The foreign-born Catholics were 2,531,-

530, out of a total foreign-born population of 6,679,943, as reported by the census. In 1890 the Catholic population was certainly 10,000,000. Of these, over 6,750,000 were natives and 3,250,000 of foreign birth. These figures are substantiated, also, by a calculation made according to the English tables of mortality; for, taking the number of Catholic births from the year 1800, and calculating the survivors, there must have been, not including Indians and negroes, over 6,000,000 native-born Catholics in 1890. In 1896 there were surely 12,000,000 Catholics in the United States, of whom no fewer than 8,250,000 were native-born. From these figures it will be seen that the great body of Catholics in the United States is, and always has been, mostly native-born and English-speaking, and that those of American parentage far outnumber those born in America of foreign parentage.

The spiritual wants of these 12,000,000 Catholics in 1896 were supplied by 10,348 priests, of whom 7,756 were seculars and 2,592 members of religious orders. There were 9,500 church buildings, besides 5,093 stations and chapels. There were 243 orphan asylums and 836 other charitable institutions, supporting 33,064 children. The number of parochial schools was 3,361, and of high schools or academies, 187 for boys and 633 for girls, which, together, educated 796,348 pupils. There were, also, 28 seminaries for ecclesiastical students, besides 3 Catholic universities empowered to confer degrees by pontifical authority, with all privileges recognized by the church. The territory of the United States is divided ecclesiastically into 68 dioceses, 4 vicariates and 14 archdioceses, governed by 72 bishops and 14 archbishops. Grouped with each archdiocese are several dioceses, which, together, make 14 ecclesiastical provinces. The work of priests, ordinarily, is to preach, offer mass, and administer the sacraments, except confirmation and holy order, in parish churches, for the benefit of the people. Bishops give confirmation and holy order, and under canon-law rule the clergy of the diocese. An appeal lies from a priest to the bishop of the diocese, and from him to the archbishop of the province, or to the Apostolic Legation in Washington. An appeal may be taken from an archbishop's court to the court in Rome, but no regular appeal can be taken from the legation. Against its decision only a recourse may be made to Rome, but it is rarely effectual.

Precedence is carefully observed in the church, to avoid confusion. Not having national customs in the United States, the general rules of canon law, together with the special regulations of the Baltimore plenary councils and the practice of the Roman court, determine the precedence of some of the clergy over others. (See TITLES, ROMAN CATHOLIC, and FORMS OF ADDRESS, in these Supplements.) After the Pope, cardinals rank first, according to their order and the time of their creation. Archbishops rank next, in the United States, according to promotion to an archbishopric. Then bishops, according to the date of their consecration. Both bishops and archbishops, according to the practice of the Roman court, are entitled "The Most Reverend," the only distinction being the addition of the word "Archbishop" or "Bishop." In a diocese, after the archbishop or bishop, the first in rank is his vicar-general, who represents him in certain acts. Then rank the diocesan consultors, who act as counselors of the bishop, and in case of vacancy in the diocese, together with the irremovable rectors, select three candidates for a new bishop, who is appointed by the Pope. The irremovable rectors rank next, followed by rural deans, if any, and the other clergy. The vicar-general is addressed "Very Reverend," all the others "Reverend." Roman prelates living in a diocese rank next to the vicar-general, prothonotaries first, then domestic prelates, then chamberlains. All these may be addressed "Monsignor."

4. The whole number of Catholics in the world has been estimated variously. Some claim there are 250,000,000; others, depending largely on statistics compiled from reports made to the Propaganda, place the number at about 235,000,000. The fact should not be overlooked, that in diocesan reports only those who are known to be Catholics are counted, many thus being unnumbered. This is especially true of such places as the United States, Canada, Australia, Asia, and Africa. Distributed in round numbers, in Europe there are 158,000,000; in South America, 33,000,000; in Mexico and Central America, 15,000,000; in the West Indies, 3,000,000; in the United States, 12,000,000; in Canada, 2,200,000; in Asia, 8,312,000; in Africa, 2,656,000; in Australia and adjacent islands, 700,000, —making a total of 234,868,000 Catholics throughout the world. It seems unnecessary to state that all Catholics owe full civil allegiance to the governments of the countries wherein they dwell. It may be interesting, however, to note that there are, under the flags of republics, more Catholics than all other people of any and no religious belief. In the republics of Europe and Africa there is a total population of about 43,550,000, of whom all but 4,456,000 are Catholics. The total population of all the republics of North and South America, estimating the United States at 63,000,000, is about 113,000,000, of whom at least 61,500,000 are Catholics, 51,500,000 being non-Catholic, or about the proportion of 15 Catholics to 13 who are not Catholic. In the whole world there are, under republican flags, about 101,000,000 Catholics to about 55,500,000 who are not Catholic. Under the various monarchical governments of Europe there are 119,000,000 Catholics, and, including Russia, 170,000,000 who are not Roman Catholics. The unity of the Catholic Church is preserved throughout the world by all members recognizing one supreme head in spiritual matters. Though bishops are chosen in various ways, still, that they may validly be installed, their election must be confirmed directly or indirectly by the Pope. While, by consecration, the bishop receives directly from God the character and powers inherent in the episcopacy, still, to a certain extent, the exercise of these powers, and his jurisdiction over a specified territory called a diocese, depend on the pope. Thus by pontifical authority bishops may be transferred willingly from one diocese to another, or even unwillingly deposed for grave cause. The see of the Pope is Rome. The 6 cardinal-bishops have sees near Rome. The car-

dinal priests have 53 churches or titles, and the cardinal deacons 16 deaconries in the city of Rome, but several of these titles never are filled. There are eight patriarchal sees of the Latin rite and 6 of the Oriental rites. Of archiepiscopal sees of the Latin rite, 19 are subject immediately to the Holy See, and 154 have ecclesiastical provinces. Of the Oriental rites, there are 18, making 191 residential archbishoprics in the world. Of episcopal sees of the Latin rite, 85 are subject immediately to the Holy See, and 626 belong to ecclesiastical provinces, being suffragan to archiepiscopal sees. Of the Oriental rites, there are 54 episcopal sees. There are also 86 titular archbishoprics and 434 titular bishoprics, which the Holy See is accustomed to confer, in order that the persons thus promoted may fill important offices in the Roman court, or act as auxiliary and coadjutor bishops to the incumbents of residential sees throughout the world. Besides these, the Propaganda has 2 titular archbishoprics and 27 titular bishoprics which it may confer with the consent of the Pope. There are 17 abbacies and prelacies belonging to no diocese. There are also 8 apostolic delegations, 125 apostolic vicariates and 39 apostolic prefectures subject to the Propaganda.

The residential sees, mentioned above, of the Latin rite are found as follows: In Austria-Hungary there are 11 archbishoprics and 44 bishoprics; in Belgium, 1 archbishopric and 5 bishoprics; in France, 17 archbishoprics and 67 bishoprics; in Germany, 5 archbishoprics and 21 bishoprics, of which 7 are subject immediately to the Holy See; in Great Britain, there is 1 archbishopric in England, with 14 bishoprics; 4 archbishoprics in Ireland, with 25 bishoprics; 2 archbishoprics in Scotland, with 4 bishoprics. Two bishoprics in Malta are subject immediately to the holy see, as is also the see of Glasgow, in Scotland. Greece has 3 archbishoprics and 5 bishoprics. Holland has 1 archbishopric and 4 bishoprics. Italy has 49 archbishoprics, of which 12 are immediately subject to the Holy See, and 222 bishoprics, of which 65 are immediately subject. Monaco, Montenegro and Bulgaria have each 1 bishopric. Portugal has 3 archbishoprics and 9 bishoprics; Roumania and Servia have 1 bishopric each. Russia, with Poland, has 2 archbishoprics and 13 bishoprics. Spain has 9 archbishoprics and 45 bishoprics; Switzerland has 5 bishoprics, all immediately subject; and Turkey 3 archbishoprics and 4 bishoprics. In Asia, Turkey has 2 archbishoprics and 1 bishopric. Japan has 1 archbishopric and 3 bishoprics. Oriental India has an apostolic delegation, 8 archbishoprics and 22 bishoprics. In Persia, there is 1 bishopric and several prefectures. A number of vicariates and prefectures cover China and the rest of Asia. These latter exist where missionary priests are preaching the Gospel but no hierarchy is yet established. In Africa, there are 2 archbishoprics and 11 bishoprics, besides 26 vicariates and 20 prefectures. Australia has 5 archbishoprics, 14 bishoprics, 4 vicariates and 1 prefecture. New Zealand, the Philippine and other islands have 2 archbishoprics and 7 bishoprics, with 10 vicariates and 2 prefectures.

In America, Canada has 7 archbishoprics and 21 bishoprics, with 3 vicariates and 3 prefectures. The United States have 14 archbishoprics and 68 bishoprics, with 4 vicariates and 1 prefecture. Mexico has 6 archbishoprics and 21 bishoprics. Central and South America have 14 archbishoprics and 66 bishoprics, each country making an ecclesiastical province. From these statistics it will be seen that the Roman Catholic Church is spread into all countries of the globe. The Latin language is used in the liturgy of all these churches, thus giving them a common medium of communication, both in church services and in councils. While unity with the Holy See is considered necessary, still, uniformity is not always required either in liturgy or discipline.

The Oriental churches in communion with the Holy See, holding the same faith and the same principle of authority as the Latin Church, have their own special rites, discipline and liturgical language. The various rites are the Armenian, Coptic, Ethiopic and Abyssinian; Greek, with Græco-Roumanian, Græco-Ruthenian, Græco-Bulgarian, Græco-Melchite subdivisions; Syrian, with Syro-Chaldean, Syro-Maronite, Syro-Malabaric subdivisions. In the Western or Latin Church, the liturgy, or the word-form of the mass, is that used by the Roman Church. To-day the only exceptions are the Ambrosian liturgy, peculiar to the Cathedral of Milan, and the Mozarabic, confined to the city of Toledo, in Spain. In the East, to-day, the chief liturgies, or word-forms of the mass, in general use are those prepared by St. John Chrysostom and by St. Basil the Great. These liturgies are used by both Catholics and schismatics. Both these forms for saying mass were originally written in Greek. Other Eastern liturgies are those ascribed to St. James the Apostle, afterward modified by St. Cyril of Jerusalem, and to St. Mark, formerly used throughout the patriarchate of Alexandria; but the latter is scarcely used at the present day, and the former only among the Syrians and Copts, with considerable changes. There are, then, in general use, in the Catholic Church, four principal liturgies, or word-forms of the mass. However, mass is said in nine different languages, viz., in Latin, Greek, Syriac, Chaldaic, Slavonic, Wallachian, Armenian, Coptic, and Ethiopic. These languages, as they appear in the liturgy, are quite different from the same languages as spoken to-day.

The Armenians in communication with the Holy See are allowed to use the Armenian language in their liturgy, and also to have special rites. Unlike all other Christians of the East save the Maronites, they use unleavened bread in the Holy Eucharist, as do the Latins. The heretical Armenians are *Monophysites*,—i.e., believers in but one nature, the divine, in Jesus Christ. The Catholic Armenians are found in Armenia, Asia Minor, Syria, Palestine, Turkey, Georgia, Greece, Egypt, Italy, Austria, and Russia. They number about one hundred and fifty thousand, and are governed by a patriarch styled "Patriarch of Cilicia of the Armenians." He resides at Constantinople. Besides the patriarch, there are two archbishops and 16 bishops. They have a college in Rome and a seminary at Begourmar, in Mount Lebanon. On the island of San Lagaro, at Venice,

they have a monastery which is famous all over the world for its printing-presses. Here most of the Armenian ecclesiastical books are printed.

The Copts in communion with the Holy See formerly were governed by a vicar apostolic residing at Cairo, but in November, 1895, Pope Leo XIII constituted for them a regular hierarchy, with a patriarch styled "Patriarch of Alexandria of the Copts." Besides the patriarch, they have two bishops. They number about thirty thousand. The heretical Copts, of whom there are one hundred and fifty thousand, are Monophysites. The Copts use three different liturgies in the celebration of mass, those of St. Basil, St. Gregory and St. Cyril. They have as many as twelve liturgies, but these three are the chief ones now used. The Coptic, or ancient Egyptian language, is used in celebrating their church services, but the rubrics are given in Arabic.

The Ethiopic or *Abyssinian* rite differs little from that of the Copts, either in discipline or church customs. The Catholic Abyssinians now number about twenty-five thousand. They are governed by a Latin vicar apostolic. The schismatic or heretical Abyssinians, of whom there are three million, are Monophysites. The church language is old Ethiopic, which is quite similar to the Hebrew.

In *Greek*, mass is said to-day by the Uniate or *Melchite* Catholics. They are to be found in Syria, Jerusalem, Russia, Greece, Italy, and in several other places in Europe. There are some, also, in America. They are called Melchite, from *Malko*, the Syriac for king, because they retained the faith and supported the Emperor Marcian against the Monophysite heretics at the time of the Council of Calcedon (A.D. 451). These Catholics are allowed by the Holy See to retain all their ancient rites, such as consecrating the Holy Eucharist in leavened bread, giving communion in both kinds, saying the creed without the "Filioque," and putting warm water into the chalice after consecration. The lower orders of the clergy are allowed to marry, and when promoted to subdeaconship, deaconship, and priesthood, they may retain their wives. But after receiving the higher orders they cannot marry. Bishops must all be single men. The Greek Catholics have three different liturgies for celebrating mass. The first, that of St. John Chrysostom, which is used ordinarily; the second, that of St. Basil, which is used on all Sundays in Lent except Palm Sunday, on Holy Thursday, Holy Saturday, the vigils of Christmas and Epiphany, and the feast of St. Basil, January 1st. The third liturgy is called the "Presanctified," and is used during Lent, except on Sundays. The Græco-Melchite Catholics, of whom there are about one million one hundred thousand, are governed by a patriarch, who is styled "Patriarch of Antioch of the Greek Melchites," but who lives in Damascus. They have, also, three archbishops and nine bishops.

In the *Slavonic* language the Græco-Bulgarians and the Græco-Ruthenians in communion with Rome celebrate mass according to the Greek liturgies. The same liturgy and language are used, also, by the schismatic church of Russia. The *Græco-Bulgarian* Catholics, in number about thirty-three thousand, have one archbishop administrator apostolic for the Bulgarians of Constantinople, and two bishops, one for Thrace, the other for Macedonia. A large number of Bulgarians follow the Roman instead of the Greek rite.

The *Græco-Ruthenian* Catholics are found chiefly in Galicia, Poland and Hungary. They have one archbishop and eight bishops, governing about four million adherents. Many Ruthenians use the Roman liturgy in the Slavonic tongue. The right to use the Slavonic language in celebrating mass was accorded in the ninth century by Pope Adrian II, when St. Methodius and St. Cyril converted the Slavs to the faith. Since the seventeenth century, when a great number of them came into the church, the *Wallachians*, with the tacit consent of the Holy See, have been saying mass in their native tongue, which, however, is the old classic language no longer in daily use. The liturgy is the Greek.

The *Græco-Roumanian* Catholics, which term includes the Wallachians, in a great national synod held in 1700 at Fogaras, "freely and spontaneously, by the impulse of God," concluded a union with the Roman Catholic Church. On that day about a million people were united to Rome. In 1854, Pope Pius IX, erected into an ecclesiastical province the United Roumanian Church, with an archbishop and three bishops. The United Catholics are chiefly in Transylvania and Hungary, and number about one million five hundred thousand. They have two native seminaries, besides several places in the Greek College in Rome given them by Pius IX.

The *Syriac* rite, like the Greek, has several subdivisions. These are Pure-Syrian, Syro-Chaldean Syro-Maronite, and Syro-Malabaric. Syrian is the liturgical language of those places where the liturgy of St. James is used in celebrating mass. It is claimed to be the same language as that used by Christ and his apostles. The *Pure-Syrians* have a patriarch who resides in Mardin, but is styled "Patriarch of Antioch of the Syrians." They have, also, three archbishops and six bishops. About fifty-two thousand Catholics use this rite. They are the remnants of the primitive Syrian Church, which never separated from the Holy See.

The *Syro-Chaldaic* is a language peculiar to Babylonian Catholics, who are chiefly converts from Nestorianism, and dwell in Mesopotamia, Armenia and Kurdistan. They have a patriarch entitled "Patriarch of Babylonia of the Chaldees," but who resides at Mosul and Bagdad. They have, also, two archbishops and ten bishops. About fifty thousand Catholics belong to the Syro-Chaldaic rite. All the liturgical books of these people are written in the Chaldaic, in that peculiar character known as the "Estrangelo"; for the Chaldaic, it may be remarked, has 18 different alphabets.

The *Syro-Maronites* use unleavened bread for confecting the Holy Eucharist; and, like the rest of the Orientals, communicate the laity under both kinds, except that in communicating the sick only the species of bread is used. They use incense at low mass as well as at high mass, and read the Gospel in Arabic after it has been read in Syriac, Arabic being the vulgar language in those countries where

this rite prevails. Their secular clergy number about one thousand, and their regular clergy, or monks, about fourteen hundred. The monks are not married. The greater number of Maronites are in Lebanon, where their patriarch resides, though he is styled "Patriarch of Antioch of the Maronites." Maronites are found, also, in Syria, Egypt, Tripoli and Cyprus. Besides the patriarch, they have six archbishops and three bishops. About five hundred thousand Catholics follow the Maronite rite. One peculiarity of their government is that the people elect the patriarch, who, however, must await the confirmation of the Pope before he is installed in office.

The *Syro-Malabaric* rite had until lately no regular hierarchy, though the Catholics number about three hundred thousand. They depended on two Latin vicars apostolic, one living in Trichoor, the other in Cottayan. Their priests, however, used their own liturgy, not the Latin one. In 1896, Pope Leo XIII gave them a hierarchy. Catholics of this rite are found chiefly in Malabar, on the west coast of India.

The various Oriental rites exist side by side, and not infrequently cover the same territory. In several instances bishops of different rites reside in the same city, both being in communion with Rome. The same may be said of the Latin and the Oriental rites, both mutually giving respect and avoiding interference. There is a movement at present for a reunion of other churches with that of Rome; and the better to examine matters connected therewith, and promote this desirable object, a special "Congregation or Commission for the Reunion of Dissident Churches" was established in Rome in 1895, by Pope Leo XIII.

J. Cardinal Gibbons.

ROMAN DE LA ROSE. See France, Vol. IX, p. 568.

ROMANES, George John, a British biologist, was born in Kingston, Ontario, Canada, May 20, 1848. He was educated at Cambridge, England, the bent of his studies drawing him to natural science, and, later on, to the exposition of evolution in the field of psychology. Early in his career he gained reputation as an investigator and writer in biology, and became intimate with Charles Darwin. For a time he was professor of physiology at the Royal Institution and lecturer on natural history at the University of Edinburgh. In 1890 he removed to Oxford, where he founded the Romanes Lectures. In 1879 he was elected a fellow of the Royal Society, and was also a member of the Linnæan Society. In 1881 he published *Scientific Evidences for Evolution*, an epitome of the testimony for evolution, which he succinctly presented in four series of arguments—from classification, or the affinities of animals and plants; from their geological succession; from their geographical distribution; and from embryology. He contributed the article on Hybridism (see Vol. XII, pp. 437–442) and Instinct (see Vol. XIII, pp. 164–166), to this Encyclopædia. His chief writings embrace *A Candid Examination of Theism* (1878); *Animal Intelligence* (1881); *Organic Evolution* (1882); *Mental Evolution in Animals* (1883); *Jelly-Fish, Star-Fish, and Sea-Urchins* (1884); *Mental Evolution in Man* (1888); *Origin of the Human Faculty and Philosophy of Natural History before and after Darwin* (1892). *An Examination of Weismannism*, comprising theories of heredity and evolution, appeared posthumously in 1896. Another posthumous volume, a collection of *Essays*, appeared in 1896, together with *Selections from His Poems*. Mr. Romanes for a time discarded the theory of intelligent design in his writings, as supernatural, and against that logic which forbids us to assume the operation of higher causes when lower ones are sufficient to produce the effect. Shortly before his death he publicly renounced his position as an opponent of teleology and the supernatural, as his *Thoughts on Religion* (1895), edited by Canon Gore, and the *Life and Letters of Romanes*, edited by his wife (1896), disclose. He died at Oxford, May 23, 1894.

ROME, a city and the capital of Floyd County, northwestern Georgia, 60 miles S. of Chattanooga, Tennessee, on the Coosa River, and on the Southern, the Nashville, Chattanooga and St. Louis and the Chattanooga, Rome and Columbus railroads. It is situated picturesquely in a rich agricultural region. The city has a large trade in grain, cotton, grass and lumber, and is at the head of navigation. It is the seat of two colleges for women, has a fine water-power, manufactures lumber, iron and machinery, and has cotton-compressing works. It also has an infirmary, banks, public parks and an electric-lighting plant. Population 1900, 7,291.

ROME, a city of central New York. It is on the Rome, Watertown and Ogdensburg, the New York, Ontario and Western and the New York Central and Hudson River railroads, and on the Mohawk and Black rivers. The city is laid out with considerable regard to beauty of location, and is in all respects attractive. The streets are well lighted by electricity, are regular, and the principal ones are one hundred feet wide. It also has a good water-supply, taken from the river. It has good public schools, St. Peter's Academy (Roman Catholic), two libraries and several banks, one a savings bank with deposits of over $2,000,000. The manufacturing industries embrace locomotive-works, iron-works, factories for the production of furniture, machinery, hardware, specialties and trimmings, cigars, cement, glue, saddlery, harness, wire, etc.; has, also, saw and grist mills, gas-works, creameries and

dairies and canning-works. Population 1890, 14,991; 1900, 15,343. See also ROME, Vol. XX, p. 860.

ROMEO, a village of Macomb County, southeastern Michigan, 30 miles N. of Detroit, on the Grand Trunk railroad. It is in an excellent farming region, and has manufactories of door-hangers, carriages and road-carts, iron castings, farm tools, steam-engines, flour and lumber. Population 1890, 1,687; 1900, 1,580.

ROMESCOT. See PETER'S PENCE, in these Supplements.

ROMILLY, JOHN, BARON. See ROMILLY, SIR SAMUEL, Vol. XX, p. 861.

RONCADOR REEF, a partially hidden bank in the Caribbean Sea, in lat. 13° 34′ N, and long. 80° 5′ W. It was on this reef that the United States warship *Kearsarge* was wrecked, Feb. 10, 1894. See also KEARSARGE, and WINSLOW, JOHN ANCRUM, in these Supplements.

RONCESVALLES. See ROLAND, LEGEND OF. Vol. XX, p. 641.

RONGE, JOHANN, a leader of a German Catholic movement (1813–87). See GERMAN CATHOLICS, Vol. X, p. 399.

RÖNTGEN, WILHELM KONRAD, a German physicist; born at Lennep, near Düsseldorf, Mar. 27, 1845. He studied at Zurich under Kundt, and became, in 1870, assistant of Kundt at Würzburg. In 1872 he went with Kundt to Strasburg, where he, in 1874, established himself as academic teacher. After he had held a professorship at the Academy of Hohenheim (Würtemberg) for a short time, he, in 1876, became professor-extraordinary of physics at the University of Strasburg, and, in 1879, professor-ordinary of physics at the University of Giessen. In 1888 he was appointed to the same professorship at the University of Würzburg, and was, in 1899, called to the University of Munich. His experimental works, published in *Annalen der Physik und Chemie*, treat, among other subjects, on the accurate determining of the relation of heat to atmosphere; on the change of solid contents and of birefraction of dielectrics by the aid of electrification; on the condensibility of fluids, and on the influence of pressure on some physical properties. He became, however, famous in 1896 by the discovery, in 1895, of the X rays — called so by himself, but since known under the name of Röntgen rays. For his discovery, which he described in his work *Ueber eine neue Art von Strahlen* (Würzburg, 3 vols., 1896–97), he was, in 1901, awarded the Nobel prize for physics. The discovery, treated in the article ELECTRICITY, resulted in many inventions embodied in its principles, like the cryptoscope (see in these Supplements) and the orthodiagraph. In surgery the Röntgen rays have proven of great diagnostic value; the bones forming the principal object by their great content of an organic substance. By their aid it is easy to follow up the healing process of fractures, to fix on a photographic plate the seat of a sprain, tuberculosis, periostitis, syphilis, sarcoma and cancer of the bones, and to localize foreign bodies in the human frame. In medicine the rays are used as accessory to percussion and auscultation in diagnosing ailments of the lungs, the diaphragm and the heart. They also have proven of therapeutical value in the treatment of lupus, eczema and cancer of the skin. G.A.S.

PROFESSOR RÖNTGEN.

RÖNTGEN RAYS OR ROENTGEN RAYS AND PHOTOGRAPHY. See ELECTRICTY, § 96, and PHOTOGRAPHY, in these Supplements.

ROOD, OGDEN NICHOLAS, an American scientist; born in Danbury, Conn., Feb. 3, 1831. He graduated at Princeton College in 1852, and studied at the Universities of Munich and Berlin from 1854 to 1858. In the latter year he became professor of chemistry and physics at Troy University and held that position until 1863, in which year he took the chair of physics at Columbia College. He was the first to apply stereoscopic photography to the microscope, and the first to make quantitative experiments on color-contrasts, to measure the duration of flashes of lightning, and to make a photometer that is independent of color. He is the author of *Modern Chromatics* and of a large number of scientific papers. He died in New York, Nov. 12, 1902. E.E.T.

ROODHOUSE, a city of Green County, western Illinois, 55 miles N. of St. Louis, on the Chicago and Alton and the Chicago, Burlington and Quincy railroads. It is in a truck and grain raising region, and contains flour-mills, grain-elevators, stock-yards, railway shops, water-works, banks and papers. Population 1900, 2,351.

ROOD-SCREEN. See ARCHITECTURE, Vol II, p. 415.

ROOF. See BUILDING, Vol. IV, pp. 433, 449–451. For groining, see ARCHITECTURE, Vol. II, p. 375.

ROON, ALBRECHT, COUNT VON, a Prussian field-marshal-general; born near Kolberg, April 30, 1803. He studied at the General War Academy of Berlin, and was from 1828–44 teacher of geography and tactics at the school of cadets. He attained all ranks in the army till he, in 1859, became lieutenant-general. In the same year he was appointed minister of war, in which capacity he effected a modern military organization for the "nation under arms." Its wonderful efficiency became manifest in the campaigns of 1864, 1866 and 1870–71. In 1871 he was created a hereditary duke and in 1873 a field-marshal-general and president of the war cabinet. He retired the same year and died at Berlin, February 23, 1879. He wrote *Die Grundzüge der Erd-Völker-und Staaten Kunde* (1833); *Militärische Länder-Beschreibung von Europa* (1837). G.A.S.

ROOPNA-RAYAN OR DALKISSORE, a river

of Bengal. See DALKISSORE, in these Supplements, p. 980.

ROOSEVELT, THEODORE, twenty-sixth President of the United States. He was born in New York city, Oct. 27, 1858. He graduated at Harvard in 1880; and has received several honorary degrees. He was a member of the New York legislature, 1882–84; delegate to the National Republican Convention in 1884; unsuccessful Republican candidate for mayor of New York, 1886; national civil service commissioner, 1889–95; president of the New York police board, 1895 to 1897; and assistant-secretary of the navy from 1897 to 1898; lieutenant-colonel, and later colonel, of Rough Riders in 1898; and governor of New York in 1899. A thorough student, he has published many valuable historical works, notably *History of the Naval War of 1812* (1882); *Life of Thomas H. Benton* (1887); *Life of Gouverneur Morris* (1888); *Historic Towns: New York* (1891); *Winning of the West* (1889–95). An indefatigable sportsman, he spent much of his time on his ranch in North Dakota, leading the rough and typical life of the frontiersman, and publishing the results of his experience and study in *Hunting Trips of a Ranchman* (1883); *Ranch Life and the Hunting Trail* (1888); and *The Wilderness Hunter* (1893). Always active in politics, he worked vigorously in every field from the primary to the assembly chamber; at all times a reformer, devoted to the enforcement of laws and the abolition of abuses, he personally investigated the evils of New York politics and legislation, and strove not only to utilize the good of existing statutes, but to turn public attention to their bad qualities. His attitude on the liquor law in New York city was characteristic of his methods and belief. As a member of the Civil Service Commission he did much to extend the scope of its influence and to bring within its rules many classes of public employees which had formerly been exempt from their operation. As president of the New York Police Board he uprooted much of the dead timber in the force, and introduced new and younger material, better fitted both physically and morally for the work. As assistant secretary of the navy he wrought vigorously for its rehabilitation and improvement; and to him is largely due the credit for the fleets' excellent work in the Spanish war. Largely instrumental in the organization of the Rough Riders, famous in that war, he declined the offer of a colonelcy therein from a consciousness of lack of experience for the position, putting forward his friend, Dr. Leonard Wood, for the post of honor, and accepting for himself the lieutenant-colonelcy. In all the actions in which his regiment was engaged he was a fearless leader, a hero and a friend to his men, and a bold instigator of movements looking to the welfare of the army and the honor of the flag. He led his men at Las Guasimas, El Caney, and San Juan Hill; was a signer, if not the originator, of the famous "round robin," was always ready for any emergency, and was actively concerned in all the measures for the restoration to health of the sick and wounded at Camp Wikoff. He was elected governor of New York in November, 1898, largely for his personal integrity and political soundness. For the latter reason, especially, he was nominated in 1900 for the Vice-Presidency of the United States on the Republican ticket, cotemporary with William McKinley for President. His metal alertness and vigorous personality, together with his known probity and frank sincerity, commended him for the office. In the autumn of 1900 he made a western tour, evoking great enthusiasm by his vigorous campaign for the platform and ticket. After the tragedy at Buffalo, Mr. Roosevelt was sworn in as Chief Magistrate, Sept. 14, 1901, to fill the unexpired term of President McKinley. On taking the oath of office, he announced his purpose to continue absolutely unbroken the policy of his lamented, martyred predecessor. His official course and ability in dealing with affairs of state indicated the wisdom of continuing him in the Presidency, for which he was unanimously nominated by the Chicago National Republican Convention, June 23, 1904, and was elected the next November by an immense majority.

THEODORE ROOSEVELT.

During his administration, President Roosevelt has endeared himself to every righteous thinking American citizen by awakening public conscience to the shortcomings in American national life and by pointing out with undaunted courage and rare frankness the necessary reforms for the preservation of private and public rectitude.

ROOT, ELIHU, an eminent New York lawyer, born at Clinton, N. Y., Feb. 15, 1845, graduated at Hamilton College in 1864, studied law and was admitted to the bar in 1867. He was U. S. District Attorney in New York city from 1883 to 1885. In 1899 he was appointed Secretary of War by President McKinley, continuing to hold the portfolio under the Roosevelt administration until Feb., 1904, when he resigned to resume his law practice in New York city. In July, 1905, he was recalled to the Cabinet by President Roosevelt to succeed Secretary of State John Hay, deceased. A.R.R.

ROOT, GEORGE FREDERICK, musician; was born at Sheffield, Massachusetts, on August 30, 1820, and settled in New York as a teacher and choir-master in 1844. He wrote many popular songs, such as *There's Music in the Air: The Battle Cry of Freedom*, and many hymns and instruction books. Died on August 6, 1895.

ROOT, JOHN WELLBORN, an American architect; born in Lumpkin, Ga., Jan. 10, 1850, died Jan. 15, 1891; educated in Liverpool, Eng., and at the College of the City of New York. In 1873 he formed a partnership with D. H. Burnham, which firm erected notable buildings in many cities; developed the "Chicago construction" for high buildings; first used steel rails embedded in concrete for foundations, and first made use of the cantilever system for upholding old walls. In 1890 he was appointed consulting architect for the Columbian Exposition.

ROOT-TUBERCLES. See ECOLOGY, in these Supplements.

ROPE-MAKING MACHINERY. Only the larger sizes of ropes are now made in ropewalks, chiefly because the manufacturers possess the old mechanisms, and do not care to pay for improved machines for sizes for which the demand is not great. In the manufacture of hemp rope in the United States, the first machines used are for forming the slivers. The single-chain or drawing machine has a chain formed of linked bars studded with pins. A pair of fluted iron drawing-rolls draw the body of hemp on the chain into a sliver four or six times the original length. The double-chain or heckling machine has a second chain, moving faster than the first chain, for combing the hemp into slivers, all lying in the same direction. These machines are arranged in sets or series, and the hemp is run through from five to ten times, according to its quality or condition. A more recent machine for this work is the Montgomery breaker, resembling the breaker used in cotton-manufacture. It combs and straightens the hemp into slivers ready for spinning. This operation is performed on a special form of spinning-jenny, on which the sliver is drawn in on capstan-wheels, and formed into thread. It is delivered as yarn, on bobbins of about fifteen pounds each. These bobbins go to the rope machines, which consist of a former and a rope-layer. In the forming-machine the threads or yarn are led through a gauge-plate, which guides them to the capstan, on which the first strand is twisted, after which a right and left screw guides the rope back and forth on a reel. These reels then go to the laying-machine, which is of the same character as the forming-machine, only much larger, and here the strands go through a similar mechanism and are laid into rope. The variations in lay are obtained by the use of change-wheels, of varying speed, used in connection with the draw-off drums. Wire rope is made on wire-stranding and wire-closing machines, which resemble the former and layer above described. The wires in the stranding-machine are passed through apertures in rotating nozzle-plates, and then through a fixed closing-block or die, after which the strand is run on to the draw-off drums. The hempen core, which is used almost universally with wire rope, is drawn through a central hole, and the plates rotate so as to twist the wires around it spirally. The finished strands, being wound on wheels, are sent to the flyers of the closing-machine, which lays them up into rope in a manner similar to the formation of the strands.

ROPEWAY, CABLEWAY, OR WIREWAY, an elevated wire-rope system of transporting suspended cars or carriers, much used in new countries and mining regions on account of its economy in first cost and in operation. In mining operations on a mountain-side where the grade is greater than one in seven, it may be operated wholly by gravity, the descending loads drawing up those ascending. Trees or stout posts with cross-arms are used as points of support for the rope at distances varying from 140 to 2,000 feet. The carriers are hung from the rope by hangers or clips. Sometimes the rope is made stationary and the carriers are rolled along, but the better and more common method is to use an endless rope, carried over large horizontal sheaves at the ends of the route. To this rope the carriers are hung, with automatic devices for dumping their contents at the proper points. About two hundred feet a minute is deemed the best speed for the rope, and if the line is run by gravity the speed is regulated by a brake. Ropeways are used in many manufacturing plants, where the nature of the work or the separation of the buildings renders it convenient. When run by gravity they will carry material two or three miles at an expense of only three or four cents a ton.

Ropeways for passenger travel have been built in various places, though they are not common. One, at Brighton, England, crossing a gorge, sustains a car that carries twelve passengers. Its construction resembles a suspension-bridge. Towers on each side of the gorge sustain an upper cable hung over them in a graceful curve. Below is another cable, which maintains a horizontal line, being supported at short distances by small ropes connected with the upper cable. The car is hung from the lower cable, and is pulled back and forth by an endless rope driven by a steam-engine. The ropeway, though not suited to carrying heavy loads, is superior to the railway in that it does not interfere with the use of land over which it passes, and the cost of construction is no more where the land is uneven than where it is level.

ROPES, JOHN CODMAN, LL. D., American author, was born in 1836 at St. Petersburg, Russia, of American parents, and died at Boston, Mass., Oct. 28, 1899. A lawyer by profession, Dr. Ropes came to make a close study of the art of war, and was noted for the excellence of his histories of great military campaigns. His chief works are *The Army Under Pope* (Campaigns of the Civil War series); *The Story of the Civil War*, of which two volumes only have as yet appeared; *The First Napoleon; The Campaign of Waterloo*, and *An Atlas of Waterloo*. Dr. Ropes was an LL. D. of Harvard and member of the Massachusetts Historical Society.

RORQUAL. See WHALE, Vol. XXIV, pp. 553–54; and FINBACK-WHALE, in these Supplements.

ROSA, CARL AUGUST, musician; was born in Hamburg in 1843, and studied music at Leipsic and Paris. He made a concert and operatic tour in the United States in 1870–72, managing a fine company, and then settled in London in an effort to produce grand operas in English. He met with many discouragements in the metropolis, but was welcomed in other parts of the kingdom, and finally attained success in London. He married the famous singer, Euphrosyne Parepa (see ROSA, EUPHROSYNE PAREPA, infra), in 1867, and died in April, 1889. W.F.J.

ROSA, EUPHROSYNE PAREPA, operatic soprano; was born in Edinburgh, Scotland, in 1836, the daughter of a Roumanian father and English mother. She became an opera singer in 1855, and attained great success, ranking among the

best sopranos of her time. She came to America in 1865, and sang at Gilmore's great peace jubilee in Boston, and during several seasons in opera, and in 1867 was married to CARL ROSA (q. v., supra). She was personally much beloved for her character and disposition. She died in England in 1874. W.F.J.

ROSA, FRANCISCO MARTINEZ DE LA. See SPAIN, Vol. XXII, p. 375.

ROSACEÆ, one of the largest and most important of the dicotyledonous families. It is characterized by its alternate leaves, regular flowers, usually numerous stamens, and one to many pistils. The principal great divisions, often regarded as families, are the almond or plum tribe, the rose tribe and the pear tribe. It furnishes the most important fruits of temperate climates, such as the apple, pear, quince, peach, plum, cherry, strawberry, blackberry, raspberry, etc., besides the showy roses of cultivation.

ROSA MONTE, a mountain on the borders of the Swiss canton of Valais, and the Italian provinces of Novara and Turin, at the east end of the Pennine Alps; the second highest mountain in the Alps, having as its highest peak the Dufour Spitze. Altitude 14,970 feet.

ROSANILINE. See ANILINE, Vol. II, p. 44.

ROSA OF LIMA OR ISABEL FLORES, the only canonized person of American nativity. See PERU, Vol. XVIII, p. 688, note.

RÖSCHER, WILHELM. See POLITICAL ECONOMY, Vol. XIX, pp. 404–415.

ROSCIUS QUINTUS. See DRAMA, Vol. VII, p. 356.

ROSCOE, SIR HENRY ENFIELD, an English scientific writer, grandson of Roscoe the historian; born in 1833, and educated at London and Heidelberg. He was professor of chemistry at Owens College from 1858 to 1886, and is distinguished chiefly for his investigations and discoveries relative to the chemical action of light and to the metal vanadium. In conjunction with Professor Schorlemmer he published a well-known *Treatise on Chemistry*. He also wrote *Lessons in Elementary Chemistry*, which has been translated into many languages; *Lectures on Spectrum Analysis; Chemistry Primer;* and published numerous articles and lectures in magazines. He became president of the British Association in 1887; was made an officer of the Legion of Honor in recognition of his services as a vice-president of the Paris Exposition; and in the same year was chosen president of the Midland Institute, Birmingham. He sat for South Manchester as an advanced Liberal in 1885, and was re-elected in 1886 and 1892.

ROSE. For general article, see ROSE, Vol. XX, pp. 873–874; and also HORTICULTURE, Vol. XII, p. 269.

ROSE, HEINRICH, a German chemist; born at Berlin, August 6, 1795. He studied at Berlin, in 1819 at Stockholm under Berzelius, and in 1821 at Kiel. In 1823 he became professor extraordinary, and in 1835 professor ordinary of chemistry at Berlin. Since 1832 a member of the Academy of Sciences; he died Jan. 27, 1864. Rose was one of the foremost of Berzelius' scholars and must be called the founder of modern analytical chemistry. In 1844 he discovered niobium. His principal work is *Handbuch der Analytischen Chemie* (1829; 6th edition, 1864–71). G.A.S.

ROSE, MARIE. See MAPLESON, MRS. MARIE ROSE, in these Supplements.

ROSE ACACIA, the common name of *Robinia hispida*, a plant of the family *Leguminosæ*. It is an ornamental shrub, with bristly branches, broad leaflets, large, showy rose-colored flowers in racemes, and bristly pods. Its well-known congener is the common locust (*R. pseudacacia*).

ROSE-APPLES, the common name of *Eugenia jambos*, a plant of India, belonging to the myrtle family. It has opposite and long, shining leaves, clusters of large white flowers, with conspicuous long stamens, and a large edible berry like a small apple.

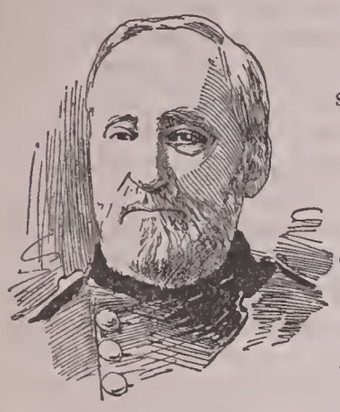
ROSEBERY, FIFTH EARL OF, ARCHIBALD PHILIP PRIMROSE, statesman and author; was born in London on May 7, 1847, and was educated at Eton and Cambridge. He succeeded his grandfather as earl in 1868, and early began to take an active interest in public affairs. In 1874 he was president of the Social Science Congress, and lord rector of Aberdeen University in 1878, and of Edinburgh University in 1880. From 1881 to 1883 he was under secretary for the Home Department under the Gladstone government, and in 1884 became first commissioner of works. In July, 1886, and 1892–94 he was Gladstone's secretary of state for foreign affairs; in 1889–90 and 1892 he was chairman of the London county council, and in 1894–96 was prime minister of England. In 1878 he married Hannah Rothschild, only daughter of Baron Meyer de Rothschild, and in 1894 and again in 1895 won the famous Derby horse race. Thus was fulfilled the ambition which he is said to have expressed in his college days, that he might win the Derby, marry an heiress, and be prime minister. Although a close friend of Mr. Gladstone, and chosen by the latter to be his successor, Lord Rosebery has never been in full sympathy with the Liberal party, and at his retirement from the premiership was practically deposed from its leadership. He is an earnest advocate of "imperial federation," has repudiated Irish home rule, and in foreign affairs has pursued a vigorous policy. He has paid much attention to letters, and has written admirable lives of the younger Pitt and of Peel, and *The Last Phase*, a study of Napoleon's closing years. W.F.J.

LORD ROSEBERY.

ROSEBURG, Oregon, the seat of Douglas County, a city on the Umpqua River, and on the Portland and Redding, Cal., division of the

Southern Pacific Company railroad, 200 miles south of Portland. It is the seat of the Oregon Soldiers' Home, and is the market center of an extensive farming and stock-raising region, with milling and mining industries. Population, 1890, 1,472; 1900, 1,690. C.L.S.

ROSECRANS, William Starke, soldier; was born at Kingston, Ohio, on September 6, 1819, and was graduated from West Point in 1842. He entered the artillery service, was engaged on the fortifications at Hampton Roads, was a professor at West Point, and was superintending engineer at Fort Adams, Newport, and surveyor at the Washington navy yard. In 1855 he resigned his commission and went into private business, but at the beginning of the Civil War returned to the army. He served under McClellan in West Virginia, and in July, 1861, succeeded him in the command of the Department of the Ohio. There he did effective work at Rich Mountain, Cheat Mountain, and Carnifex Ferry, and received the thanks of the West Virginia and Ohio legislatures. After much important survey work and other campaigning he won the battles of Iuka and Corinth, in the fall of 1862, and was then put in command of the Department of the Cumberland. He made headquarters at Nashville, won the great battle of Stone River, for which he received the thanks of Congress, and invaded Alabama and Georgia. In the battle of Chickamauga, on September 19 and 20, 1863, he narrowly escaped destruction, and a month later he was relieved of his command, but afterward served in Missouri. Afterward he was minister to Mexico and a representative in Congress. He died on March 11, 1898. W.F.J.



GEN. W. S. ROSECRANS.

ROSELLY DE LORGUES, Antoine François Félix, a French religious writer; born in Grasse, Aug. 11, 1805; was authorized, in 1860, to add de Lorgues to his name. He studied law, but gave it up for the study of religious questions and philosophy; received the cross of the Legion of Honor in 1837, and was made an officer in 1855. His writings include *Le Christ Devant le Siècle* (1835); *De la Femme et du Serpent* (1842); *La Croix dans les deux Mondes* (1844); *Christophe Colomb* (1856), and *Histoire Posthume de Christophe Colomb* (1885).

ROSE-MALLOWS. See Incense, Vol. XII, p. 757.

ROSENKRANZ, Karl, a German philosopher and historian of literature; born at Magdeburg, April 23, 1805. He studied at Berlin, Halle and Heidelberg; became, in 1831, professor at Halle, and held a professorship of philosophy at Königsberg from 1833 to the time of his death, June 14, 1879. He was a very versatile writer, and tried to introduce the ideas of Hegel's system into all spheres of literature and life. His works include *Encyclopädie der Theologischen Wissenschaften* (1831); *Studien* (1832–47); *Psychologie und Wissenschaft vom Subjectiven Geist* (1837); *Wissenschaft der Logischen Idee; Neue Studien* (1875–78). He also published Hegel's *Leben*, and with Schubert, a complete edition of Kant's works. G.A.S.

ROSENTHAL, Moriz, an Austrian pianist; born in Lemberg, Dec. 18, 1862. He studied under Mikuli, and gave his first concert at Vienna in 1876; was appointed pianist to the Roumanian court in 1878; created a sensation by his playing in St. Petersburg and Paris; has played in all the countries of Europe, but deferred his visit to England until 1895, when he made an immediate success. In 1898–99 he played in the United States.

ROSE OF JERICHO or ROSE OF THE VIRGIN. See Rose, Vol. XX, p. 874.

ROSE OF SHARON, a popular name for *Hibiscus Syriacus*, a plant of the mallow family and well known as the common Althæa of gardens. See also Althæa, in these Supplements.

ROSEOLA or GERMAN MEASLES. See Measles, Vol. XV, p. 665.

ROSES, Wars of the. See England, Vol VIII, p. 293.

ROSLYN, a residence village of southeastern New York, on Long Island, at the south end of Hempstead Harbor, 23 miles E.N.E. of Brooklyn, on the Long Island railroad. It has a classical school, and flour, planing and paper mills and a canning factory. The village was named by William Cullen Bryant, who had a residence there. Pop. 1890, 1,251 (1900 included in Greater N.Y.).

ROSLYN, a town of Kittitas County, central Washington, 26 miles N.W. of the county seat, Ellensburg, on the Union Pacific railroad. Its main occupation is coal-mining, as it produces about two thousand tons per diem. Population 1890, 1,484; 1900, 2,786.

ROSNY, Léon, a French Orientalist and ethnographer; born Aug. 5, 1832, at Loos; in 1868 professor of Japanese language and literature at Paris. He, in 1859, founded the Société Orientale et Américaine, and organized the international congresses of Orientalists. Among his works are *Études Asiatiques* (1864); *Eléments de la Grammaire Japonaise* (1873); *A Grammar of the Chinese Language* (1874); *Interprétation des Anciens Textes Mayas* (1875); *Les Documents Écrit de l'Antiquité Américaine* (1882); *Codex Cortesianus* (1883); *Taureaux et Mantilles* (1894). G.A.S.

ROSOLIC ACID, trioxy-diphenyl-tolyl-carbinol anhydride ($C^{20}H^{16}O^3$), is formed by treating rosaniline with nitrous acid. It is a phenol dye-stuff dissolving in alkaline solutions with red color, and is known by the trade-name of methylanrine. It is also used as an indicator in the laboratory.

ROSS, Alexander Milton, naturalist; was born in Ontario, Canada, in 1832, and became a physician in New York. In the Civil War he was an army surgeon. In 1866 he returned to

Canada and engaged in zoölogical and botanical pursuits. In 1881 he helped to found the Society for the Diffusion of Physiological Knowledge. He was the author of *Recollections of an Abolitionist* (1867); *Birds of Canada* (1873); *Mammals, Reptiles and Fresh-Water Fishes of Canada* (1878); *Flora of Canada* (1873), and other works. He died in Oct., 1897. W.F.J.

ROSS, JONATHAN, lawyer; was born at Waterford, Vermont, on April 30, 1826, and was graduated from Dartmouth College in 1851. In 1856 he was admitted to the bar, was a member of the Vermont assembly in 1865–67, and of the state senate in 1870. He was also a state's attorney, a member of the state board of education, and a member of the last council of censors, in 1869. He was a justice of the Vermont supreme court in 1870–90, and chief-justice in 1890–1900. In Jan., 1899, he was appointed U. S. Senator from Vermont, to fill the vacancy caused by the death of Justin S. Morrill, and in 1900–02 he was chairman of the state railroad commission. Died, 1905.

ROSSE, LAURENCE PARSONS, EARL OF, a British astronomer; born at Birr Castle, King's County, Ireland, Nov. 17, 1840. He succeeded to his father's title in 1867; was educated at Trinity College, Dublin, and at Oxford; was chancellor of Dublin University, and one of the Senate of the Royal University of Ireland; was elected president of the Royal Dublin Society in 1887, and published numerous articles on various scientific subjects.

ROSSETTI, CHRISTINA GEORGINA, poet; sister of Maria Francesca, Dante Gabriel and William Michael Rossetti; was born in London, England, on December 5, 1830, was well educated and exhibited precocious powers, her first poem being printed in 1842. In 1847 her first volume of verse appeared, and in 1850 she began contributing to her brothers' periodical, *The Germ*, under the pen-name of Ellen Alleyne. Her first important volume was *The Goblin Market and Other Poems* (1862), which was followed with *The Prince's Progress* (1866); *Commonplace* (stories, 1870); *Sing-Song* (1872), and *A Pageant* (1881). A number of her poems were published as *New Poems* in 1896. Her health for years was poor, and a morbid strain appears in nearly all of her writings, with the possible exception of the *Goblin Market*. She was an ardent Italian patriot, and for that reason declined to enter the Roman Catholic Church, but instead found refuge in extremely "high" Anglicanism, and devoted much time to worship and to charitable works. Upon these religious grounds she was estranged from a lover to whom she was deeply attached, and that circumstance also tinctured many of her poems with the hues of disappointed and hopeless love. She died of cancer, after a long illness, in London on December 29, 1894. W.F.J.

ROSSETTI, MARIA FRANCESCA, sister of Christina G., Dante G. and W. M. Rossetti; was born in London on February 17, 1827, and was the most practical and normal member of the family. She wrote some Italian text-books and religious works, entered a religious sisterhood in 1874, and died on November 24, 1876. W.F.J.

ROSSETTI, WILLIAM MICHAEL, poet and art-critic, brother of Dante Gabriel and Christina Georgina Rossetti; was born in London, Sept. 25, 1829, and educated at King's College School, London. Mr. Rossetti, who long held a post in the English civil service, came to notice as a critic of fine art and literature in 1850. He was much engaged (together with his brother, Millais, Holman Hunt, Woolner and others) in "Pre-Raphaelite" art from its commencement in 1848; and he edited and wrote for *The Germ*, a magazine conducted by the Pre-Raphaelites in 1850. He published *Dante's Comedy, the Hell* (translated into blank verse, 1865); *Fine Art, Chiefly Contemporary* (1867), a volume of republished criticisms; an edition of *Shelley's Poetical Works* (1870; revised edition, 1878), with a memoir and a large body of notes; *Lives of Famous Poets* (1878), being brief biographies of British poets, from Chaucer to Tennyson, some of them reproduced from the series named *Moxon's Popular Poets*, with others added; an edition of the *Collected Works of Dante Gabriel Rossetti* (1887); a *Life of Keats* (1887), in the series of *Great Writers;* and *Dante Gabriel Rossetti as Designer and Writer* (1889). He also edited, with a memoir, *William Blake's Poems*, in the Aldine series; and in 1868 issued a selection from the *Poems of Walt Whitman.* Among his other works are a poem of modern life, *Mrs. Holmes Grey* (1869); and a *Criticism of Swinburne's Poems and Ballads* (1866). Mr. Rossetti delivered in 1875 a series of lectures on *Shelley's Life and Poems*, and on *The Wives of Poets.* In 1890 he published a copiously annotated edition of Shelley's *Adonais* in the Clarendon Press series; also editions at various times of Coleridge, Campbell, Keats, and Milton; also *Dante Gabriel Rossetti: His Family Letters* (1896). He also edited a collection of his sister, *Christina Rossetti's Poems* (1896). He wrote the article on SHELLEY, in this ENCYCLOPÆDIA (Vol. XXI, pp.826–31), and more than a score of other articles, most of them treating of Italian painters.

ROSSI, ERNESTO, actor and author; was born at Leghorn, Italy, in 1829, and was educated for the bar. Instead, he turned his attention to the drama, and in 1853 was associated with Ristori. He organized a company of his own in Italy, with much success, and also appeared in other countries, playing an Italian version of *Le Cid* at the Théâtre Français in Paris. He gave a series of Shakespearian plays in London, and was also seen in the United States in 1881. He was the author of a number of plays, including *Adela*, written for Ristori; *The Hyenas*, a social comedy, and *The Soldier's Prayer;* also a treatise on *Hamlet; Dramatic Studies; Forty Years of Artistic Life*, and a romance, *Niccolai.* He died in Italy in June, 1896. W.F.J.

ROSSITER, STEALY B., clergyman; was born at Berne, New York, in 1846, and was graduated from Union College in 1865, and Union Theological Seminary in 1869. He entered the ministry

of the Presbyterian Church at Elizabeth, N. J., and for twenty-seven years was pastor of the North Presbyterian Church in New York city. Since 1897 he has been secretary of the American McAll Association, allied with the McAll Missions in France. He is the author of *The Red Cord* and other works. W.F.J.

ROST, Pierre Adolphe, soldier and jurist; was born in France in 1797, became a law student, and served in the army. After Waterloo he came to America; settled in Louisiana; was a state senator in 1822; a justice of the state supreme court in 1838, and again in 1846–52. He was one of the three Confederate commissioners to Europe in 1861, and a special commissioner to Spain in 1862, but found his errands fruitless. He died on September 6, 1868. W.F.J.

ROST, Reinhold, Orientalist; was born at Eisenberg, Germany, on February 2, 1822, and was educated at Jena. He settled in England in 1847, was Oriental lecturer at St. Augustine's College, Canterbury, secretary to the Royal Asiatic Society, and librarian to the India Office. He edited a number of works on Sanskrit literature and other Oriental topics, and was the author of Siam: Language and Literature in this Encyclopædia. He died on February 7, 1896. W.F.J.

ROSTAND, Edmond, dramatist and poet; was born at Marseilles, France, in 1868. His works include *Les Romanesques* (1894); *La Princess Lointaine* (1896); *La Samaritaine* (1897), and *Cyrano de Bergerac* (1898). These are all dramas. His poems comprise *Les Musardises*, *Pour la Grece*, and *L'Aiglon* (1900). He was elected to the French Academy in 1901. W.F.J.

ROSTRA, platforms. See Rome, Vol. XX, p. 835.

ROT, a general name in plant pathology, applied to the diseases which follow the attacks of parasitic fungi, as bitter-rot of apples, black-rot and other rots of grapes, potato-rot, plum-rot, tomato-rot, root-rot, dry-rot of timber, etc.

ROTARY MAGNETIC FIELD. See Electricity, § 89, in these Supplements.

ROTARY PRESSES. See Typography, Vol. XXIII, p. 754; and Presses, in these Supplements.

ROTARY TRANSFORMERS. See Electricity, § 77, in these Supplements.

ROTATION OF CROPS. See Agriculture, Vol. I, pp. 303, 304.

ROTATORIA, same as ROTIFERA. Vol. XXI, pp. 7–12.

ROTCH, Abbott Lawrence, an American meteorologist; born in Boston, Massachusetts, Jan. 1, 1861; entered the Boston Institute of Technology; founded at his own expense the Blue Hills Observatory, in Massachusetts, 1885; was associate editor of *The American Meteorological Journal* (1886–92); represented the United States at the Paris Exposition (1889); appointed chevalier of the Legion of Honor; member of the international meteorological committee on the classification and nomenclature of the clouds (1891). His observations made at the Blue Hill Observatory have been accepted all over the Eastern states.

ROTHROCK, James Harvey, jurist; was born at Milroy, Pennsylvania, on June 1, 1829, and was taken to Ohio in 1838. He was educated at Franklin University, New Athens, Ohio, was admitted to the bar, was prosecuting attorney of his county, and removed to Iowa in 1860. There he was a member and speaker *pro tem.* of the state assembly in 1861, served as a volunteer officer in the Civil War and led a desperate charge at Vicksburg, was elected to the district court bench in Iowa in 1866, and ten years later was appointed to the supreme bench, serving there for twenty-three years. He died on January 14, 1899. W.F.J.

ROTHSCHILD, a notable Jewish family, prominent in finance and politics. For some account of the earlier members, see Rothschild, Vol. XXI, p. 7. W.F.J.

ROTHSCHILD, Alfred Charles de, was born in London, England, on July 20, 1842, son of Baron Lionel de Rothschild, and was educated at King's College, London, and Trinity College, Cambridge. He has been a director of the bank of England, and a trustee of the national gallery. He is one of the foremost collectors of pictures, china, furniture, etc., in England, and has published two volumes of richly illustrated catalogues of his collections. W.F.J.

ROTHSCHILD, Lionel Walter, son and heir of Baron Nathan Mayer Rothschild; was born in London on February 8, 1868, and has devoted himself to mercantile affairs and to zoölogical researches. He has been a trustee of the British Museum since 1899, and has published *Avifauna of Laysan* and numerous magazine articles, and is one of the editors of *Novitates Zoölogicæ*, published at the Zoölogical Museum. W.F.J.

ROTHSCHILD, Nathan Mayer, Baron Rothschild, was born in England on November 8, 1840, a son of Lionel Nathan Rothschild, who was the first Jew elected to the House of Commons, and who was the means of Jewish enfranchisement in England. He was educated at Trinity College, Cambridge, and was a Liberal member of the House of Commons for Aylesford from 1865 to 1885. In the latter year he was elevated to the peerage as Baron Rothschild, of Tring Park, Hertfordshire. He has been lord lieutenant for Buckinghamshire since 1889. He possesses a notable art collection, and is an extensive landowner, holding more than 15,000 acres. W.F.J.

ROTTENSTONE. See Geology, Vol. X, p. 207.

ROTTERDAM, the second largest city and the commercial center of the Netherlands, and the capital of South Holland. The trade of Rotterdam has in recent years grown rapidly. In 1888 the quays measured 15 miles in length, and the docks covered an area of 190 acres. Since then other docks have been made and wharves extended. The new waterway of the

Hook of Holland, first used by ocean steamers in 1872, has been deepened to over 22 feet, and vessels have ceased to approach the city by the old channel. In 1899 it was estimated that, taking all the vessels that entered all the ports of Holland from abroad, more than 70 per cent (tonnage) entered at Rotterdam. The net tonnage of the vessels (which numbered 6,036 in 1899) so entering doubled between 1875 and 1890, and was in the latter year eight times what it was in 1880. To this foreign trade should be added 84 per cent. of the total trade between Germany and Holland by the way of the Rhine and a traffic carried on the canals and streams. If all these items be put together, the total tonnage of vessels entering Rotterdam in 1899 amounted to 5,813,034 tons, a figure that was only excelled by London among European ports. The figures quoted do not include the returns of the fishing-fleet, which sold in Rotterdam in 1890 fish to the value of $95,000. The merchant fleet of Rotterdam itself numbered in 1890 86 vessels of 117,208 tons. In 1899 the total tonnage of vessels entering and clearing Rotterdam was 8,104,142 tons, or about seventy per cent of the carrying trade of the Netherlands. Rotterdam sends to the Dutch Eastern possessions and to the West Indies provisions, spirits, wines, mineral waters and manufactured goods, in return for coffee, sugar, spices, cotton, dye-woods, etc. To England and Scotland, with which it carries on an extensive and lucrative trade, it sends cheese, butter, flax, madder, seeds, fruits, ducks, and large numbers of sheep and cattle. With America and with France, Spain, Portugal and the northern states of Europe it has also a considerable trade. Along the Rhine it sends to Germany and Switzerland sugar, coffee, cotton, butter, cheese, dye-woods, indigo, spices, Dutch tobacco, rape-seed, madder, fish, etc., in return for wheat, rye, Moselle and Rhine wine, pipe-clay, pottery ware, chemical stuffs, etc. Rotterdam has distilleries, windmills and sugar-refineries, besides important manufactures of iron, soap, sail and hair cloths, cigars, vinegar, liquors and jewelry. It is a very important market-center for tobacco, coffee, grain, indigo and petroleum. Population 1906, 390,364. For general description, see ROTTERDAM, Vol. XXI, pp. 13–15.

ROUBLE OR RUBLE. See MONEY, Vol. XVI, p. 758.

ROUDAIRE, ELIE, (1836–85), a French engineer. See SAHARA, Vol. XXI, p. 159.

ROUGÉ, OLIVER CHARLES CAMILLE EMMANUEL, VICOMTE DE, a French Orientalist; born in Paris, April 11, 1811. He devoted himself to Oriental studies, particularly to Hebrew, Arabic, and Coptic, and finally to Egyptology exclusively. In 1849 he became keeper of Egyptian antiquities in the Louvre, and was the first to attempt the translation of long Egyptian texts from papyrus. He became member of the French Institute in 1853 and professor of Egyptology in the Collège de France in 1860. He is credited with the discovery of the Egyptian doctrine of immortality. One of his published works traces our modern alphabet through the Greek and Phœnician back to an Egyptian source. Among his historical works is *Recherches sur les Monuments qu'on peut attribuer aux Six Premières Dynasties de Manéthou* (1866); and upon Egyptian religion and mythology: *Explication d'une Inscription Égyptienne, prouvant que les Anciens Égyptiens ont Connu la Génération du Fils du Dieu* (1851). He died in Bois Dauphin, Dec. 31, 1872.

ROUGE-ET-NOIR, a game at cards, often called *trente et quarante*—thirty and forty. In this well-known game six packs of cards are used. The face or court cards count ten, the others count according to the number of spots. It is played between a banker and an indeterminate number of players. The banker takes his position at the middle of the table, at each end of which are two figures which are of a diamond shape and are colored red or *rouge* and black or *noir*. There are four chances on which the player may lay his stake: *rouge*, *noir*, *couleur* and *inverse*. The cards must be shuffled and cut and laid in a row face upwards. The banker stops when the total of points represented is between 30 and 40—the ace counting one. This line, or row of cards, is the one designated as *noir*. Another row is immediately dealt, which is called *rouge*. If the sum of the cards in *rouge* most closely approximates 31, those who have staked on that color win, and receive double the sum wagered. If *noir* wins the players staking on that color become winners with stakes doubled. If the points of the two colors are equal, that necessitates another deal. Should the sum in each color be exactly 31, then the banker takes half of all the stakes. If the first card turned up is of all the winning color, *couleur* wins. In the contrary case, *inverse*.

W.R.B.

ROULETTE, a game of chance played on a table in the center of which is a bowl-shaped cavity, about two feet in diameter, whose sides are divided into 38 compartments, painted black and red alternately. The bottom of the bowl revolves on a central axis. When the movable bottom is put in motion, an ivory ball is thrown into the cavity, and when the movement ceases the ball falls into one of the compartments at the sides. At the ends of the table are 38 spaces into which the players place their stakes. These spaces are numbered correspondingly with the numbers in the compartments of the wheel, viz., 1 to 36 and a single and a double 0. The numbers are alternately red and black. Besides playing the numbers, the player can put his stake on either the red or the black, and receive, in case the ball falls into a red compartment and his stake is on the red, an amount equal to what he has played. He can also play an odd or even number in the same way, or again the high and the low. If he plays the high, he is betting that the ball will fall in a number above 18 to 36; if the low, a number from 1 to 18. When the player puts his stake on any single number and the ball

falls in the corresponding number in the wheel, he receives 36 times the amount of his stake. The bank in an American game of roulette has a larger percentage than that of the French one, from the fact that the former uses both the single and the double 0, while the latter use but the single 0. In the event that the ball should fall in either the single or the double 0, the bank claims every bet on the table unless a player has a bet on either the single or double 0, when he receives 36 times the amount of his stake. There are further regulations, by which a player receives 18 times his stake if he plays 2 numbers, 12 times if 3 numbers, etc. The game is 19 to 18 in favor of the bank, but other ways of playing it vary the proportion. This game was forbidden by law in 1838 in France, and in 1873 in Germany. It is proscribed in Great Britain and the United States by their respective gambling-laws.

ROUMANIA. (For general article, see ROUMANIA, Vol. XXI, pp. 18–27.) The area and population are known only by estimates. The total area is 50,720 square miles, and the population by the census of Dec., 1899, was 5,912,520. The people themselves, though of mixed origin, may now be regarded as homogeneous. Roumanians are spread extensively in the neighboring countries—Transylvania, Hungary, Servia, Bulgaria; their total number probably is between nine and ten millions. Included in the population of Roumania proper are 5,469,036 Roumanians, 300,000 Jews, 200,000 gipsies, 50,000 Bulgarians, 20,000 Germans, 1,500 Magyars, 15,000 Armenians, 2,000 French, 1,000 English, besides about 3,000 Italians, Turks, Poles, Tartars, etc.

The constitution in force in 1899 was voted by a constituent assembly, elected by universal suffrage in the summer of 1866. It has twice been modified—in 1879, and in 1884. The Senate consists of 120 members, elected for 8 years, including 2 for the universities, and 8 bishops. The Chamber of Deputies consists of 183 members, elected for four years. A senator must be 40 years of age, and a deputy 25. Members of either house must be Roumanians by birth or naturalization, in full enjoyment of civil and political rights, domiciled in the country. For the Senate an assured income of about $1,800 is required. All citizens of full age, paying taxes, are electors, and are divided into three electoral colleges. For the Chamber of Deputies, electors who are in possession of property bringing in $250 or upward per annum vote in the first college. Those paying direct taxes to the state of $4 or upward annually, vote in the second college, as well as persons exercising the liberal professions, retired officers, state pensioners and those who have been through the primary course of education. The third college is composed of the remaining electors, of whom those not knowing how to read or write vote indirectly. For the Senate there are only two colleges. The first consists of those electors having property yielding annually at least $400; the second, of those persons otherwise eligible, but whose income from property is from $160 to $400 per annum.

REIGNING KING AND ROYAL FAMILY. Carol I, King of Roumania, was born April 20, 1839, a son of Prince Karl, of Hohenzollern-Sigmaringen. He was elected "Domnul," or Lord, of Roumania, April 20, 1866, and accepted his election May 22, 1866; was proclaimed King of Roumania, March 26, 1881; was married Nov. 15, 1869, to Princess Elizabeth von Neuwied ("Carmen Sylva"), born Dec. 29, 1843.

The succession to the throne of Roumania, in the event of the king remaining childless, was settled, by article 83 of the constitution, upon his elder brother, Prince Leopold, of Hohenzollern-Sigmaringen, who renounced his rights in favor of his son, Prince Wilhelm, the act having been registered by the Senate in October, 1880. Prince Wilhelm, on Nov. 22, 1888, renounced his rights to the throne in favor of his brother, Prince Ferdinand, born Aug. 24, 1865, who, by a decree of the king, dated March 18, 1889, was created "Prince of Roumania."

The king has an allowance of about $237,000.

EDUCATION AND RELIGION. Education is free and compulsory where there are schools. According to the published summaries of 1898–99, there were 4,057 primary schools, with 321,873 pupils. There were 8 normal schools, 52 high schools, and 2 universities, the latter at Bucharest and Jassy.

Of the total population of Roumania proper, it is estimated that 5,408,743 belong to the Orthodox Greek Church, 168,276 are Roman Catholics or Protestants, 6,598 Armenians, 10,000 Lipovani (Russian heretics), 269,000 Hebrews, 40,000 to 44,000 Mohammedans. The government of the Greek Church rests with two archbishops, the first of them styled the Primate of Roumania, and the second the Archbishop of Moldavia. There are, besides, six bishops of the National Church, and two Roman Catholic bishops.

FINANCE. The chief sources of revenue consist in direct and indirect taxes, and the profits derived from the extensive state domains and valuable salt-mines, and the salt and tobacco monopolies. The capitation tax is $1.14 per head. There is an income tax of 6 per cent on houses, 5 per cent on property farmed by a resident owner, 6 per cent on property let by an owner resident in Roumania, and 12 per cent on estates of non-resident owners. The revenue for the year 1901–02 was $43,644,067; expenditure, $42,945,749. The budget estimate for 1899–1900 was $45,076,568 alike for revenue and expenditure. The unit of value is the leï, equivalent to 19.3 cents.

The public debt of Roumania amounted on April 1, 1901, to $296,395,558. Of the total amount, more than half has been contracted for public works, mainly railways. The remainder has been contracted to cover deficits, reduce unfunded debt, and pay peasant freeholds.

ARMY AND NAVY. The entire military strength of Roumania is divided into permanent, territorial, militia, and *levée en masse*. The strength of the permanent army in time of peace is 3,280 offi-

cers, 388 employees, 60,000 men, 11,930 horses, and 390 guns. The total of the territorial army is 72,000 men and 7,500 horses. The militia consists of 33 regiments of infantry. Strength of the *levée en masse* is not definitely fixed.

Every Roumanian from his 21st to his 46th year is obliged to serve either in the permanent army three years of active service, or in the territorial infantry five years of active service, or in the territorial cavalry four years of active service, and afterward, till the age of 30, serve in the reserve of the army to which he belongs. The entry into the permanent or territorial army is decided by lot. All young men not taken for the conscription form part of the militia. After completing their service in the permanent or territorial army, all are enrolled in the militia until their 36th year.

Roumania has in the navy the *Elisabeta*, a shot-protected cruiser of 1,320 tons displacement and 4,500 horse-power, 3½-inch armor at the belt; four 6-inch and eight machine guns; the *Mircea*, training-ship; a composite brig of 350 tons, a yacht of 350 tons, a screw dispatch vessel, 7 gunboats, 6 coast-guard vessels, and 6 first-class and 2 second-class torpedo-boats; also a floating dock. There are about 50 officers and 1,600 seamen.

The total number of vessels that entered the ports of Roumania in 1900 was 27,090 of 7,528,855 tons; and the number that cleared was 27,015 of 7,084,990 tons. In 1900, Roumania's merchant navy included 392 vessels of 74,604 tons, including 54 steamers of 12,785 tons. In 1901, there were 2,060 miles of railway, the state conducting all of it. The imports for 1901 were valued at $43,400,000, the exports at $56,000,000.

ROUMANIAN LANGUAGE. See ROMANCE LANGUAGES, Vol. XX, p. 686.

ROUMANILLE, JOSEPH, a French poet; born in St. Remy, Bouches-du-Rhône, Aug. 8, 1818; professor in a Tarascon school; finally settled in Avignon as a bookseller. While at Tarascon he wrote a poem in the Provençal language to please his mother, who could not understand his French verse. The title of the work was *Jejè*, and its literary style was the revival of a form of speech once common in France, but obsolete at this time except among certain country people. A coterie intent on a Provençal renaissance soon gathered about him, which took the name of the Félibres, and of it Frédéric Mistral became the chief ornament; Roumanille, at the time of his death, was its Capoulié. He wrote *Oubrets en Vers*, *Lou Curat de Cucugna*, and *Lou Abal Tabuissoun*. His writings are characterized by the blithe gayety and the monkish paganism of troubadour times—quaint, sincere and humorous in their childlike artlessness. He died in Avignon, May 24, 1891.

ROUNDHEAD. See WHIG AND TORY, Vol. XXIV, p. 570.

ROUND-TABLE. See ARTHUR, Vol. II, 568.

ROUND-TABLE CONFERENCE, THE. See HOME RULE, in these Supplements.

ROUPHI OR RUPHIA, a river. See ALPHEUS, Vol. I, p. 540.

ROUSE POINT, New York, a village of Clinton County, half a mile south of the Canadian boundary, and on the west shore of Lake Champlain, at the outlet of the Richelieu River, 185 miles north of Albany. It is an important junction and port of entry on divisions of the Delaware & Hudson, the Grand Trunk and the Rutland railroads, and on the Central Vermont main line. Lumbering and a shipping trade constitute the chief industries. North of the village are the remains of Fort Montgomery, built unknowingly on Canadian territory at a cost of $500,000 by the United States Government after the War of 1812; it was abandoned, but since the Ashburton Treaty of 1842 is included in United States territory. Population, 1890, 1,856; 1900, 1,675. C.L.S.

ROUSSEAU, LOVELL H., an American soldier and politician; born near Stanford, Ky., Aug. 4, 1818. He studied law, and in 1841 began practice in Bloomfield, Ind. He was a member of the Indiana House of Representatives, 1844–45; served as captain in the Mexican war; sat in the Indiana Senate; returned to Kentucky, and began practice in Louisville; and was elected to the Kentucky Senate. He served with distinction in the Union army during the Civil war, and rose to the rank of major-general of volunteers. He was a Representative in Congress from Kentucky from Dec. 4, 1865, to July 21, 1866, when he resigned, owing to a fracas in the Capitol; was subsequently re-elected, and served from Dec. 3, 1866, to March 3, 1867, when he was appointed brigadier-general in the United States Army and assigned to duty in Alaska. Later he was appointed to command the Department of the Gulf, and died in New Orleans. Jan. 7, 1869. E.E.T.

ROUSSEAU, PHILIPPE FRANÇOIS, painter; was born in Paris on February 25, 1816, and studied under Bertin and Gros. He received numerous medals for his works, at the Salon and at world's fairs, and was made an officer of the Legion of Honor in 1870. He died on December 5, 1887. W.F.J.

ROUSSET, CAMILLE FÉLIX MICHEL, historian; was born in Paris on February 15, 1821, and was educated at the University and the College of St. Louis. He was a professor successively at Grenoble, at the Collège Bourbon and at the Lycée Bonaparte, and in 1864 was made historian and librarian to the French Ministry of War. In 1871 he was made an officer of the Legion of Honor and was elected to the French Academy in place of Prevost-Paradol. He wrote a *Précis of History of the French Revolution* (1849); *The Volunteers of 1791–1794* (1870); *The Grand Army of 1813* (1871); *History of the Crimean War* (1877); *The Conquest of Algiers* (1879), and numerous other historical works. He died at St. Gobain on October 19, 1892. W.F.J.

ROUTH, MARTIN JOSEPH, an English clergyman and educator; born in South Elmham, Suffolk, Sept. 18, 1755. After graduating at Oxford in 1774 he held various college positions until he became president of Magdalen College in 1791,

which post he retained nearly sixty-four years. In 1810 he was presented the living of Tylehurst, Berkshire. Routh published an edition of Plato's *Enthydemus et Gorgias;* edited Burnet's *History of His Own Times;* and a volume of *Scriptorum Ecclesiasticorum Opuscula* (1832). But he was best known by his valuable collection of the fragmentary writings of the Christian Fathers of the 2d and 3d centuries under the title, *Reliquiæ Sacræ* (4 vols., 1846–48). He died in Oxford, Dec. 22, 1854.

ROUTING-MACHINE. A mechanism for cutting away portions of a surface, as of wood. It is used to lower the blank spaces of engravings, for various gaining operations, for letting in the risers and treads of stairways, and for numerous operations in cabinet work. A stout upright column bears a hinged framework, at the extremity of which is the rotating cutter. The frame is powerfully braced, to avoid spring, and the cutter is driven by means of pulleys on the column, at the hinges and on its own spindle, these pulleys being connected by belts. This arrangement allows the cutter full play horizontally anywhere within the swing of the frame. Handles are placed on the frame for guiding the cutter according to the will of the operator, and a screw is provided for feeding the cutter-spindle to its work.

ROVE-BEETLES, the popular name for the beetles of the family *Staphylinidæ.* They are small insects, with very short wing-covers (*elytra*). Representatives of the family are common under stones and other objects.

ROVING. See Cotton Machinery, Vol. VI, pp. 438, 439.

ROWAN, Stephen Clegg, naval commander, was born in Ireland on December 25, 1808, came to America in boyhood, and studied at Oxford College, Ohio. While there he was, in February, 1826, appointed a midshipman in the United States navy. In 1837 he was promoted to be a lieutenant, and as such served in the Mexican War with high credit. At the beginning of the Civil War he was a commander, and he served actively throughout that war; at first on the Potomac River, then with Burnside's expedition to the North Carolina coast, and then off Charleston, S. C. In the last named service his work was particularly arduous, and was performed with exceptional discretion and efficiency. He was promoted for merit to be, successively, captain, commodore, and rear-admiral, attaining the latter rank at the end of the war. In 1866–67 he was in charge of the navy-yard at Norfolk, and for several years thereafter commanded the Asiatic squadron. While in Asian waters, on August 15, 1870, he was promoted to the grade of vice-admiral. Upon his return home he was put in command of the navy-yard at New York, then became president of the board of naval examiners, in 1882 was made superintendent of the naval observatory, and finally in 1883 was appointed head of the lighthouse board. On February 26, 1889, he was placed upon the retired list. He died on March 31, 1890. W. F. J.

ROWAN-TREE. See Ash, Vol. II, p. 594.

ROWBOTHAM, John Frederick, poet and historian; was born in Yorkshire, England, on April 18, 1859, and was educated at Balliol College, Oxford. He was elected to a scholarship, and traveled for years in Spain, Italy, Austria, Germany and France. He entered the ministry of the English Church, and served in various places. He has published *The History of Music* (1887); *The Death of Roland: An Epic Poem* (1888); *Poetical Works* (1889–90); *A Short History of Music* (1891); *The Private Life of the Great Composers* (1892); *The History of Rossall School* (1894); *The History of the Troubadours and the Courts of Love* (1895); *The God Horus: A Novel of Ancient Egypt* (1898), and *The Human Epic* (1902). W. F. J.

ROWING. In recent years no radical modifications have been made in the style of boat used. They are mostly built of cedar or some such wood, although a few American crews have tried paper boats; but these have not been very popular. Aside from this, the only general improvement has been in the seat. All oarsmen now use a seat on rollers instead of the old sliding style.

The chief rowing events in England are still the annual race between Oxford and Cambridge, and the international regatta at Henley. In the former, beginning with 1886, Cambridge won four years in succession, but since then Oxford has made seven straight wins, and in 1893 established a new record of 18 minutes and 47 seconds for the course. Out of 52 races betwen them Oxford has now won 30 and Cambridge 22 races. At Henley the interest was much heightened in 1895 by the appearance of the Cornell College crew from America, and in 1896 by the entrance of Yale and by the appearance of Dr. McDowell of Chicago.

In America rowing has existed since the beginning of the century, but the interest in crews was purely local until after 1850, when the leading colleges took up the sport. The first intercollegiate boat race was between Yale and Harvard, on Lake Winnipiseogee, Aug. 3, 1852. Since then various college associations have existed, sometimes including one set of colleges and sometimes another, and at one time (1872) one existed having 11 colleges represented. In 1876 Yale and Harvard formed a dual association, which existed until 1895, when it was discontinued. All except the first two of these races, which were rowed at Springfield, were rowed at New London. Out of 20 races Yale won 13 and Harvard 7, and the best time, 20 minutes 10 seconds, made in 1888, was by Yale. This is also a world's record for four miles with 8-oared shells. In 1890 Cornell and the University of Pennsylvania formed an association, and in 1895 included Columbia. Up till the latter year Cornell had always won, but her best crew was at Henley in that year, and Columbia won; while Cornell's crew in England was not fortunate enough to win. In 1896 Yale's crew was in England, when they met defeat, so the Cornell-Columbia-Pennsylvania Asssociation included Harvard, Cornell winning.

Harvard and Columbia also established an asso-

ciation for freshmen crews in 1880, which lasted till 1896, when they included the Cornell freshmen, who before had always won from Pennsylvania. Yale also rowed from 1891 to 1895, but in 1895 the University of Wisconsin, which for a number of years had supported a crew, sent it east and defeated the Yale freshmen. Among the colleges one of the most remarkable records is that of Cornell, which out of 43 intercollegiate races, including freshmen, since 1873 has only lost 9.

The National Association of Amateur Oarsmen, formed in 1873, holds an annual regatta at Saratoga, which is the chief rowing attraction of the year outside of the intercollegiate contests. The events competed are as follows: Single-scull shells, senior; single-scull shells, junior; pair-oared shells; double-scull shells; 4-oared shells, senior; 4-oared shells, junior; 8-oared shells, senior; 8-oared shells, junior. This association has a membership of 93 clubs, in all parts of the country.

ROWLAND, Henry Augustus, an American scientist; born in Honesdale, Pa., Nov. 27, 1848. He graduated at Rensselaer Polytechnic Institute in 1870, and engaged in railroad surveying, 1871. He taught in Wooster University, 1871–72; was instructor (1872–74) and assistant professor of physics (1874–75) in the Rensselaer Polytechnic Institute; studied abroad for a year; and accepted the chair of physics at Johns Hopkins University in 1876, a position he held until his death. He was a member of the Electrical Congress at Paris and served on the jury of electrical exhibits there in 1881, and the same year was made chevalier and in 1896 officer of the Legion of Honor. His principal scientific work has been the discovery of magnetic action due to electric convection; the exact determination of the mechanical equivalent of heat; the discovery of concave grating; and the invention of the machine for ruling gratings by which spectrum analysis has been revolutionized. He received the Rumford, Draper, and Mattenci medals for his discoveries. He was a member of the National Academy of Sciences; a fellow of the American Association for the Advancement of Science; and an honorary member of several British and Continental philosophical societies and institutions of learning. He died in Baltimore, Md., April 16, 1901. E.E.T.

ROYAL, Joseph, publicist, was born at Repentigny, Quebec, Canada, on May 7, 1837, and was educated at St. Mary's College, Montreal. He became a journalist, founding *L'Ordre*, *Le Nouveau Monde*, *La Revue Canadien* and *Le Metis*, now *Le Manitoba*, the last named at Winnipeg. He also rose to eminence at the Winnipeg bar, was a member of the Manitoba legislature in 1870–79, and thereafter member of the Dominion House of Commons until 1888, being also attorney-general and minister of public works. In 1888 he was made governor of the Northwest Territory and filled that place until 1893. He was vice-chancellor of the University of Manitoba in 1877, and a commissioner for a revision of the statutes. Since 1893 he has been editor of *La Minerve*, of Montreal, the journal on which he began his career in 1857. He has written a number of political pamphlets. W.F.J.

ROYCE, Josiah, an American educator; born in Grass Valley, Cal., Nov. 20, 1855. He graduated at the University of California in 1875, in which institution he was instructor of English literature and logic, 1878–82. He has been instructor and assistant professor of the history of philosophy at Harvard College, 1882–92, and professor since the latter year. He is the author of *The Spirit of Modern Philosophy* (1892); *The World and the Individual* (1901); *The Conception of Immortality* (1900). E.E.T.

ROYERSFORD, Pennsylvania, a borough of Montgomery County, on the Schuylkill River, opposite Spring City, and 32 miles north of Philadelphia, on the Philadelphia & Reading railroad. It manufactures agricultural implements, stoves, glass, and fire brick. Population, 1890, 1,815; 1900, 2,607. C.L.S.

ROZE, Marie. See Mapleson, in these Supplements.

RUATAN or ROATAN. See Honduras, Vol. XII, p. 133.

RUBERYTHRIC ACID. A complex substance found in the madder-root, which breaks up into glucose and alizarin.

RUBIACEÆ, an exceedingly large family of gamopetalous plants, containing almost five thousand species, mostly tropical or sub-tropical, and especially American. No external characters can easily distinguish the family, as in many other families, the opposite leaves and interpetiolar stipules probably being the best index. The great subdivisions of the family, sometimes regarded as distinct families, are the *Cinchoneæ*, to which belong the cinchona (quinine) and its allies; the *Coffeeæ*, the coffee-plant and its allies; the *Spermacoceæ*, a small group of weeds, chiefly tropical; and the *Stellatæ*, the most northern group of the family, and chiefly represented in our flora by the species of *Galium* or cleavers.

RUBIAN. See Madder, Vol. XV, p. 177.

RUBICELLA. See *Spinel*, under Mineralogy, Vol. XVI, p. 402.

RUBICON, a small river of northern Italy, flowing into the Adriatic, which in 49 B. C. formed the southern boundary of the province governed by Julius Cæsar. For Cæsar to cross it with his army at the outbreak of the civil war between him and Pompey would virtually have been a declaration of war against the republic; hence, "to cross the Rubi-

con" has come to mean to take a step which cannot be retraced, to commit one's self to a momentous and hazardous undertaking. It is not certainly known whether the modern Luso or the Fiumicino was the ancient Rubicon, but there is a preponderance of evidence in favor of the latter. See ITALY, Vol. XIII, p. 446.

RUBIDIUM. See POTASSIUM, Vol. XIX, pp. 609, 610.

RUBIN, a dye. See FUCHSINE, in these Supplements.

RUBINSTEIN, ANTON GRIGORIJEWITSCH, a Russian pianist and composer; born at Wichwatinetz, in the Russian government of Cherson, Nov. 18, 1829; received his first instruction in piano-playing from his mother and later from Alex Villoing. After a stay of one year and a half at Paris he gave concerts in the Netherlands, Germany and Sweden. In 1844 he settled in Berlin, studying composition under Dehn, and in 1846 in Vienna, and in 1848 returned to Russia. From 1854–81 he toured Germany, France, England, North America (1872); Italy and Spain. From 1885–86 he gave a cycle of historical piano recitals in the prominent centers of the continent, which had a sensational success. Since 1859 conductor of the Russian Society of Music, founded by himself, and director of the Petersburg Conservatory; he was ennobled by the Emperor of Russia in 1889. He died Nov. 20, 1894, at Peterhof. Rubinstein ranks as one of the foremost of modern piano virtuosos, while as a composer, he shows, especially in his earlier compositions, great originality and a virile temperament. Among his compositions are the Russian operas *Dimitry; The Revenge; The Demon* and *Gorjusha;* the German operas *Die Kinder der Heide; Feramoras* (*Lalla Rookh*); *Die Makkabaer; Nero; Unter Räubern*, and *Der Papagei;* the ballet *Die Rebe;* the oratorios *Das Verlorene Paradies; Der Turmbau zu Babel; Sulamith; Moses* and *Christus;* 5 symphonies, overtures, string quartettes, piano trios, concert and sonatas and characteristic pieces for piano, song and choruses. He published *Die Music und ihre Meister* (1862).

ANTON RUBINSTEIN.

G.A.S.

RUBLEE, HORACE, an American editor and statesman; born in Berkshire, Vermont, August 19, 1830; went with his parents to Sheboygan County, Wisconsin, in 1846; learned the printing-business in Madison, where he went in 1848; was legislative correspondent for the Madison *Argus*, and afterward editorial writer on the *State Journal*, then a Whig organ, of which he became editor. For years he stood at the head of the Republican Party in the state; took an active part in the election of Lincoln, and successfully supported for the United States Senate T. W. Howe, who had opposed the ideas of state rights. In 1869 he was appointed minister to Switzerland, and by his timely articles on the Alabama question in European journals received the thanks of the Secretary of State. He resigned his position as minister in 1876, and the following year was again appointed chairman of the State Central Republican Committee. He made a bold and successful stand in the succeeding campaign for sound money; in 1881 became editor of a new journal, *The Republican and News*, later consolidating with the Milwaukee *Sentinel*, and supported the candidacy of W. D. Hoard for governor. He died in Milwaukee, Oct. 19, 1896.

RUDBECK, OLOF. See SWEDEN, Vol. XXII, p. 793.

RUDIMENTARY STRUCTURES. See EMBRYOLOGY, in these Supplements.

RUDINI, ANTONIO DI, MARQUIS, an Italian Premier; born in Palermo, Sicily, in 1839. In 1866, when only 26 years of age, he became mayor of his native city; was prefect of Palermo soon after, and held the same office in Naples in 1868. In 1869, at the age of 30, he was chosen Minister of the Interior, and later, until 1882, a deputy from Canicatti; then a deputy from Syracuse, when he formed a new Parliamentary group called the Young Right. Upon the overthrow of the Crispi Ministry, Feb. 6, 1891, Rudini was chosen Prime minister, which office he administered till May 6, 1892, when his policy for an increase in military expenses caused his retirement. He was succeeded by Crispi, who held the office till the spring of 1896, when the defeat of the Italian army by the Abyssinians and the presence of mobs in the streets of Rome caused him to resign, March 5, 1896. A new ministry was promptly formed under the Marquis di Rudini as President of the Council and Minister of the Interior. During Rudini's first premiership he reduced the expenses of African colonization, and in all his official acts sought to promote the strength, honor and dignity of Italy.

RUDLER, FREDERICK WILLIAM, an English scientist; born in London, July 8, 1840. In 1861 he was appointed assistant in the Museum of Practical Geology, and in 1870 assistant-secretary of the Ethnological Society. In 1876 he was appointed professor of natural science in the University College of Wales, but resigned in 1879 to become curator of the museum. In 1880 he presided over the anthropological department of the British association; was director of the Anthropological Institute, and editor of its *Journal*, joint editor of Ure's *Dictionary of Arts*, and with others the author of *Europe* in Stanford's *Compendium of Geography*, and president of the Geologists' Association (1889). He contributed to this ENCYCLOPÆDIA articles on EARTHQUAKE and ELECTRO-METALLURGY, and other subjects; was a copious writer of articles for scientific journals, and a lecturer with the London Society for the Extension of University Teaching.

RUE, an herb. See HORTICULTURE, Vol. XII, p. 302.

RUFFED GROUSE (*Bonasa umbellus*), a grouse so named because of a ruff of feathers on the neck,

common in the densely-wooded districts of temperate regions of North America. It is popularly known as partridge in New England and Western states, while in the Middle states it is called pheasant. See GROUSE, Vol. XI, p. 198; and BONASA, in these Supplements.

RUFFIN, EDMUND, an American agriculturist; born in Prince George County, Va., Jan. 5, 1794. He studied at William and Mary College and served in the war of 1812. Later he devoted himself to the study of practical agriculture, and for many years was president of the Virginia Agricultural Society. He published *Calcareous Manures* (1832) and for ten years conducted the *Farmer's Register*. He served in the State Senate, 1824–27. An enthusiastic secessionist, he fired the first gun at Fort Sumter. He committed suicide near Dansville, Va., June 17, 1865.

E.E.T

RUGER, THOMAS HOWARD, an American soldier; born in Lima, N. Y., April 2, 1833. He graduated at West Point in 1854, and was assigned to the engineer corps; resigned his commission, April 1, 1855; practised law in Janesville, Wis., 1855–61; became lieutenant-colonel of the 3d Wisconsin Volunteers in 1861, and colonel in 1862; the same year was commissioned brigadier-general of volunteers; served in the Rappahannock campaign, and commanded a division at Gettysburg; aided in suppressing the draft riots in New York, 1863; served under Sherman and in the battle of Franklin; became colonel, U. S. A., in 1866; military governor of Georgia, 1868; was superintendent of the United States Military Academy, 1871–76; commanded the Department of the South, 1876–78; became brigadier-general, U. S. A., in 1886, major-general in 1895; retired in 1897, and died in 1907.

RULE NISI, a rule or order obtained in a cause pending in court upon an *ex parte* motion requiring the party against whom the rule is entered to show cause, by a certain time named in the rule, why the relief asked by the order should not be granted. Notice must be served upon the party against whom the rule was entered, and the question is then heard as other motions. The rule is made absolute upon the final hearing unless good cause is shown.

RULE OF THE ROAD. At sea. See NAVIGATION, Vol. XVII, p. 285. In general. See ROAD, RULE OF, in these Supplements.

RULING-MACHINE. See GRADUATION, Vol. XI. pp. 27, 28.

RUMFORD. See THOMPSON, XXIII, 330, 331.

RUMPELT, ANSELM, a German poet, born at Chemnitz, Saxony, Feb. 10, 1853. His *Will-o'-the-Wisps* (1878), a collection of historical lyrics, shows remarkable talent. He wrote under the pseudonym Alexis Aar.

RUMP PARLIAMENT. See *Pride's Purge*, under ENGLAND, Vol. VIII, p. 312.

RUMSEY, JAMES, an American inventor; born at Bohemia Manor, Cecil County, Md., in 1743. A machinist, he introduced improvements in mill machinery, and in September, 1784, exhibited on the Potomac a boat propelled by machinery, and in March, 1786, exhibited another boat propelled by steam. He obtained patents in Virginia and Maryland in 1787. In the following year the Rumsey Society was formed by Franklin and others, to aid him in his work. In London he met with general favor, and procured patents in England, Holland, and France. A successful exhibition was given on the Thames in December, 1792; but further prosecution of his plans was prevented by his death, which occurred in London, Dec. 23, 1792. In 1839 the Kentucky legislature presented his son with a gold medal commemorative of his father's contribution to the world's progress. E.E.T.

RUNES. See SCANDINAVIAN LANGUAGE, Vol. XXI, pp. 382, 383; and ALPHABET, Vol. I, p. 538.

RUNKLE, JOHN DANIEL, an American educator; born in Root, N. Y., Oct. 11, 1822. He graduated at the Lawrence Scientific School, Harvard, in 1851, and served as assistant on the *American Ephemeris and Nautical Almanac*, 1849–84; and edited the *Mathematical Monthly*, 1858–61. He was Walker professor of mathematics at the Massachusetts Institute of Technology from 1865 till his death; became its acting president in 1868, and president, 1870–78. In 1876 he introduced manual training into the United States from Russia. He was the author of *Analytic Geometry; The Manual Element in Education; Report on Industrial Education*, etc. He died in Southwest Harbor, Me., July 8, 1902.

E.E.T.

RUNNING. See HORSE-RACING, in these Supplements.

RUNNYMEDE, a meadow in Surrey, 21 miles S.W. of London. It was the scene of the signature of Magna Charta. See JOHN, Vol. XIII, p. 724.

RUNYON, THEODORE, lawyer and diplomat; was born at Somerville, New Jersey, on October 25, 1822, of French Huguenot descent, and was graduated from Yale College in 1842. He was admitted to the bar in Newark, N. J., in 1846; was city attorney in 1853–55, and city counsel in 1856–64, and in 1864 was elected mayor. During the Civil War he was commander of the first full brigade of New Jersey volunteers that went to the front. He was made chancellor of the state of New Jersey in 1873, and filled the office until 1887, and then declined reappointment. In March, 1893, he was appointed United States minister to Germany, and in October of the same year was raised to the rank of ambassador. He died suddenly at Berlin, on January 27, 1896. W.F.J.

THEODORE RUNYON.

RUPEE, a coin. See MONEY, Vol. XVI, 759.

RURIK, founder of the Russian Empire. See RUSSIA, Vol. XXI, p. 96.

RUSDEN, GEORGE WILLIAM, an Australian educator and author. In 1849 he was appointed agent for the establishment of national schools in Victoria, Australia, and afterward agent and inspector of schools in New South Wales. In 1851, when Victoria was separated from New South Wales, he was made chief clerk in the Colonial Secretary's office; clerk of the executive council in 1852; clerk of the legislative council and of the Parliaments in 1856; from 1853 to 1882 served as magistrate; for some time member of the National Educational Board in Victoria; member of the council of the University of Melbourne from its foundation till his absence in Europe caused him to resign; fellow of the Royal Geographical Society, the Royal Historical Society, the Royal Asiatic Society, etc. He wrote *National Education; Discovery, Survey and Settlement of Port Philip; Curiosities of Colonization; History of New Zealand; History of Australia* (1883); *Aureretanga, the Great Refusal* (1890); and other works.

RUSH, JAMES, an American physician; son of Dr. Benjamin Rush; born in Philadelphia, Pa., March 1, 1786. He graduated at the College of New Jersey (now Princeton University) in 1805, took his degree of Doctor of Medicine at the University of Pennsylvania in 1809, and later studied at Edinburgh. He achieved a high reputation as a physician, but later in life sought retirement among his books. He was the author of *Philosophy of the Human Voice* (1827); *Analysis of the Human Intellect* (1865); *Rhymes of Contrast on Wisdom and Folly* (1869). He bequeathed $1,000,000 to the Philadelphia Library, conditioned on its exclusive appropriation to the Ridgeway Branch. He died in Philadelphia, May 26, 1869. E.E.T.

RUSH, RICHARD, an American statesman; son of Dr. Benjamin Rush; born in Philadelphia, Aug. 28, 1780. He graduated at the College of New Jersey in 1797, and was admitted to the bar in 1800. He became known as an orator and a successful advocate, and in 1811 was appointed attorney-general of Pennsylvania and comptroller of the United States treasury. In 1814 he was appointed attorney-general of the United States, and in 1817 went as minister to England, holding that position for seven years, during which period he negotiated several important treaties. In 1825 he became secretary of the treasury; later negotiated some American municipal loans in Europe; and in 1835 acted as boundary arbitrator between Ohio and Michigan. In 1836 he secured a settlement of the Smithsonian legacy, and later became a regent of the Institution. He was minister to France from 1847 to 1851. He published *Narrative of a Residence at the Court of London; Washington in Domestic Life;* etc. He died in Philadelphia, July 30, 1859. E.E.T.

RUSHVILLE, a village and the capital of Schuyler County, west-central Illinois, 45 miles E. N. E. of Quincy, on the Chicago, Burlington and Quincy railroad. It has wagon factories, flour-mills, brick and tile works and a creamery. Coal is mined in the vicinity. It is in a fertile agricultural region; contains five churches, a national bank, two newspaper-offices and a high school. Population 1900, 2,292.

RUSHVILLE, a village and the capital of Rush County, central southeastern Indiana, 39 miles E.S.E. of Indianapolis and 33 miles W.S.W. of Richmond, on the Cincinnati, Hamilton and Dayton, the Cleveland, Cincinnati, Chicago and St. Louis, the Pittsburg, Cincinnati and St. Louis and the Lake Erie and Western railroads. It has manufactures of flour, lumber and furniture, and has a large trade in grain, live-stock and lumber. Rushville has the most extensive blooded-horse market in the state. Population 1890, 3,475; 1900, 4,541.

RUSK, Texas, the seat of Cherokee County, a town on the St. Louis Southwestern railroad, and the terminus of the Texas State railroad to Palestine, 16 miles southeast of Jacksonville. Extensive iron deposits supply the raw material for the state smelting works and the articles produced by the prisoners in the Eastern Texas Penitentiary situated here. Population, 1900, 527. C.L.S.

RUSK, JEREMIAH MCLAIN, an American public man; born in Morgan County, Ohio, June 17, 1830. He removed to Vernon County, Wis., in 1853, held various local offices, and was a member of the State House of Representatives in 1862. In July of that year he became major, and later colonel, of the 25th Wisconsin Volunteers, and at the close of the war was brevetted brigadier-general. He was a Representative in Congress from Wisconsin, 1871–77. He was Secretary of Agriculture from March 3, 1889, to March 5, 1893. He died in Viroqua, Wis., Nov. 21, 1893. E.E.T.

JEREMIAH M. RUSK.

RUSK, THOMAS J., an American lawyer and public man; born in Camden, S. C., Aug. 8, 1802. He studied law, and began practice in Georgia, but moved to Texas in 1835. He was a delegate to the convention which declared for the independence of Texas in 1835, and was first Secretary of War of the new republic. At the battle of San Jacinto he took command of the forces after General Houston was wounded, retaining it until October, 1836, when he resumed his duties as Secretary of War. He was chief justice of the supreme court of Texas, 1838–42; president of the convention which confirmed the annexation of Texas to the United States in 1845;

and United States senator from Texas from March 26, 1846, to July 29, 1856, when he died, at Nacogdoches, Tex. E.E.T.

RUSKIN, JOHN, an English art critic and prose-writer, was born in London, Feb. 8, 1819. He was educated privately, as his autobiographical reminiscences in *Præterita* inform us, till he passed to Christ Church, Oxford, where he won the Newdigate prize for verse in 1839, and graduated in 1842. His taste for art was early manifested, and, after graduating, he studied painting under Harding and Copley Fielding, but his masters, as he tells us, were Rubens and Rembrandt. At the outset of his career he was led to take up a defense of J. W. M. Turner (q. v., Vol. XXIII, p. 710) and the contemporary school of English landscape-painting against the foreign trammels which had fastened themselves upon modern art, and especially to prove the superiority of modern landscape-painters over the Old Masters. This revolutionary opinion, though at first it was hotly combated, established the new critic's position as a writer on art, and the defense grew into the famous work called *Modern Painters* (5 vols., 1843–60). This elaborate work deals with general æsthetic principles, and, with a charm that is irresistible, presents us with its author's ideas of beauty, and enshrines word-poems on mountain, leaf, cloud and sea which, it is not too much to say, will live forever in English literature. In the second volume Mr. Ruskin takes up the Italian painters, and discusses at length the merits of their respective schools. From the study of painting, Mr. Ruskin passed for a time to that of architecture. In this department we have, from his pen, *The Seven Lamps of Architecture* (1849) and the *Stones of Venice* (1851–53). Then followed lectures on drawing, perspective, decoration and manufacture, with later crotchets and theories on political economy, pre-Raphaelitism, etc., with a flood of opinions on social, ethical and art subjects, enriched by rare intellectual gifts and religious fervor. His whole writings form a body of literature unique of its kind, pervaded with a charm of literary style, and inspired by a high moral purpose. Mr. Ruskin's excursions into non-æsthetic fields, and the strange jumble of Christian communism to which, late in life, he gave vehement expression, have detracted much from his early fame. In everything he wrote, the Ruskinian spirit comes strongly out, colored with an amiable egotism, and enforced by great assurance of conviction. The moral purpose he had in view, and the charm and elevated tone of his writings, lead us to forget the wholly ideal state of society he sought to introduce, and we are won to the man by the passion of his noble enthusiasms. With the advent of the pre-Raphaelite school, Mr. Ruskin warmly espoused its art-principles in a series of letters to the London *Times* in 1851, and in a number of lectures, since gathered into his *Collected Works*, in 26 volumes. The following are some of his varied lectures and treatises on æsthetic subjects: *Lectures on Architecture and Painting* (1854); *The Two Paths* (1854), dealing with art in its application to decoration and manufacture; *Elements of Drawing* (1857); *Elements of Perspective* (1859); *Ariadne Florentina* (1873), a monograph on Italian wood and metal engraving; and *Aratra Pentelici* (1872), on the principles of sculpture. Besides these, he published, at various times, a number of instructive and inspiring lay sermons on the mystical union between nature and art, beauty and utility, and their reflex in the reverential homage for the beautiful and the worthy in the mind and character of the race. In this latter service he has produced a great body of fine and thoughtful work, which is as enchaining as its meaning is often profound. The best known of these lay sermons are *The Crown of Wild Olive*, essays on work, traffic and war; *Sesame and Lilies*, essays, especially for girls, on improving literature; *Ethics of the Dust*, in which nature's crystallization is a foil for a diatribe against sordid living; *The Queen of the Air*, a splendid blending of his fancy with the Greek myths of cloud and storm; *The King of the Golden River*, a fairy story; *The Eagle's Nest*, on the relation of natural science to art; *Proserpina*, in which flowers were what storm and cloud were for *The Queen of the Air; Love's Meinie*, on birds; and *Deucalion*, on geology. His other writings embrace four volumes, entitled *Fors Clavigera* (1871–74), lectures to English workingmen and laborers; *Val d' Arno*, on thirteenth-century art in Pisa and Florence; *Pleasures of England*, on English modern art and history; *Time and Tide*, letters to a workingman; *Mornings in Florence*, Christian art-studies for travelers; *St. Mark's Rest*, on Venetian history; *Munera Pulveris* and *Unto This Last*, two treatises on political economy, with a volume of *Lectures on the Political Economy of Art* (1858). He has also published a monograph on *Giotto and His Works in Padua* (1854); two volumes of his letters, entitled *Arrows of the Chace* (1880); *Hortus Inclusus*, letters to women; *Notes on the Construction of Sheepfolds* (churches); a work on the *Poetry of Architecture;* a collection of his early *Poems*, and *Præterita*, previously mentioned, unfinished installments of an autobiography. In addition to this varied work for art, Mr. Ruskin has held a lectureship at Cambridge, and a professorship of fine art at Oxford, which he once left because of his opposition to vivisection at the university, and he founded St. George's Guild at Oxford for inculcating in young and old the gospel of manual labor, opposed to all modern mechanical and manufacturing processes, with the old-time virtues of purity, manliness and courage. In all these labors and aims Mr. Ruskin set before himself a high, if somewhat Quixotic, ideal of life, and with great earnestness did much, not only for the elevation of his fellow-men, but for the development of sound artistic taste and the enriching and spiritualizing of life by seeking to surround it at all times with the true and the beautiful. In 1873 Mr. Ruskin became his own publisher, and found it remunerative, as well as more

JOHN RUSKIN.

satisfactory to his fastidious taste in books. In old age ill health arrested his productiveness. The best account of him is by his secretary, W. G. Collingwood, which appeared in 1893. Died at Brantwood, Eng., Jan. 20, 1900. G. MERCER ADAM.

RUSSELL, HENRY CHAMBERLAINE, a British astronomer; government astronomer of New South Wales, Australia, since 1863; fellow of the Senate of the University of Sydney, and vice-president of the Board of Technical Education, New South Wales. Under his direction, parties were sent out in 1874 and 1882 to observe the transit of Venus, and in 1881 that of Mercury. He presided over the first Australian Meteorological Conference in 1879. He wrote seventy-five or more reports and original papers upon astronomical and meteorological matters, which were published by the New South Wales government, by the Royal Astronomical Society of London, and by the Royal Society of New South Wales.

RUSSELL, WILLIAM CLARK, novelist; was born in New York city on February 24, 1844, the son of English parents; his father, Henry Russell, having been a well-known musical composer. His novels, which are many and popular, are chiefly devoted to incidents of seafaring life and adventure. Among them are *John Holdsworth, Chief Mate* (1874); *The Wreck of the Grosvenor* (1875); *The Lady Maud* (1876); *A Sailor's Sweetheart* (1877); *An Ocean Free-Lance* (1878); *The Frozen Pirate* (1877); *An Ocean Tragedy* (1881); *My Shipmate, Louise* (1882); *The Emigrant Ship* (1894); *The Ship, Her Story* (1894); *The Convict Ship* (1895); *What Cheer?* (1895); *Rose Island* (1896); *The Tale of the Ten* (1896); *List, Ye Landsmen!* (1897); *The Two Captains* (1897); *The Romance of a Midshipman* (1898); *The Ship's Adventure* (1899); *Overdue* (1903); *Abandoned* (1904), and *Wrong Side Out* (1904). He also has written a *Life of Nelson*; a *Life of Collingwood*; a *Life of Dampier*; *Pictures from the Life of Nelson*, and numerous articles and short stories. W.F.J.

RUSSELL, WILLIAM EUSTIS, statesman; was born in Cambridge, Massachusetts, on September 6, 1857, and was graduated from Harvard College in 1877. He studied law and was admitted to the bar. In 1881 he was elected to the Cambridge common council, and in 1883 became an alderman. In 1885 he was nominated for mayor of Cambridge by the Democrats and Independents, and was elected; and twice thereafter was re-elected. This made him a conspicuous leader of the Democratic party in that Republican state. In 1888 he was nominated for governor, and ran ahead of the Presidential ticket, but was defeated. In 1889 he was again a candidate, but again was defeated. In 1890, however, he was elected, and was the youngest man that ever filled the place of governor of Massachusetts; and in 1891 he was re-elected, though all the rest of the Democratic ticket was defeated. Again in 1892 he was re-elected for a third term. He died in Canada on July 16, 1896. W.F.J.

RUSSELL, SIR WILLIAM HOWARD, an Irish journalist; born in Lilyvale, County Dublin, March 28, 1821; entered Trinity College in 1838; entered the Middle Temple, and was called to the bar in 1850. On the declaration of war with Russia he was dispatched to the Crimea as special correspondent of the *Times*, through which journal he made known to the public the sufferings of the army in winter quarters. The account aroused such indignation that the ministry was succeeded by a government pledged to military reform. In 1857, on the outbreak of the Mutiny in India, he was again war correspondent for the *Times*. In 1861, at the beginning of the Civil War, he proceeded to Washington as correspondent of the same paper, and joined McDowell's army on the day of the first battle of Bull Run. His account of the rout of the Federal army was greatly censured in the United States, and gained for him the sobriquet of "Bull Run Russell." He was correspondent during the war between Prussia and Austria in 1866, between France and Germany in 1870, and was with Lord Wolseley in the Zulu troubles and in Egypt. Mr. Russell published numerous works, as *Letters from Crimea; Diary in India; My Diary North and South;* etc. He was a knight of the Iron Cross, commander of the Legion of Honor, and had Indian, Turkish and other war medals. He was knighted in 1895.

SIR W. HOWARD RUSSELL.

RUSSELL OF KILLOWEN (CHARLES RUSSELL), LORD, an English jurist; born on the outskirts of Newry, County Down, Ireland, in 1833, and died in London, August 10, 1900, at the age of sixty-seven. He came of an old Roman Catholic and patriotically Irish family. Commencing life in the office of an attorney at Newry, he turned toward the bar in 1851 and moved to London as offering greater possibilities of success. Here he supported himself at first by reporting in the press gallery of the House of Commons. In 1859 he was called to the bar at Lincoln's Inn and speedily became prominent as an advocate. He was appointed a queen's counsel in 1872, having established himself as one of the leaders of the English bar. In 1880, after two unsuccessful attempts, he entered Parliament and became, in turn, Solicitor-General and Attorney-General. A man of strong political convictions, he was an earnest follower of W. E. Gladstone and a warm advocate of Home Rule. He devoted little of his time to St. Stephen's or its politics, confessing,

LORD RUSSELL.

somewhat sadly, that "common law admitted of no bedfellow."

As an advocate, his fame was more than national, and few were the great trials in which he was not retained. Some one once said of him that he was the only man at the bar who could speak in italics. His voice, if it had not the exquisite silvery cadence of Lord Coleridge's, was clear, persuasive and resonant. The words were always aided by energetic action, and by the deep, gleaming eyes of the speaker. He could bring a special technical knowledge to bear upon almost any case submitted to him. It has been well said that no one but Lord Russell could have delivered that famous speech before the Parnell Commission of 1880. The skill with which he could play upon the emotions of a jury made him much sought after in society scandal suits. He was concerned as an advocate in the Colin Campbell divorce case, the Crawford divorce case, the Tranby Croft baccarat scandal, wherein the Prince of Wales was called as a witness, and defended Mrs. Maybrick for murder. While Attorney-General under the Gladstone administration of 1886, he was knighted. On the decease of Lord Bowen in 1894, he was appointed a Lord of Appeal in Ordinary, with a life peerage, and in July of the same year, Lord Chief Justice of England, in succession to Lord Coleridge.

In 1896 he visited the United States in company with Sir Frank Lockwood and other English jurists, and delivered an address on "International Arbitration" before the annual meeting of the Bar Association of America, held in Saratoga Springs, New York. He presided over the trial of Dr. Leander Starr Jameson and his fellow raiders for invading the Transvaal, and at a single sweep brushed away every legal technicality and cobweb of old-time law from the Foreign Enlistment Act of 1870.

RUSSELLVILLE, Arkansas, the seat of Pope County, a town 74 miles west of Little Rock, on the St. Louis, Iron Mountain and Southern railroad, and terminus of the branch line to Dardanelle, four miles south on the Arkansas River. It is a market town with grist and saw mills, and wagon, agricultural implement, and ice factories. Population, 1890, 1,321; 1900, 1,832. C.L.S.

RUSSELLVILLE, a town and the capital of Logan County, southwestern Kentucky, 47 miles N. of Nashville, on the Louisville and Nashville railroad, has a flour-mill, tannery, wagon, plow and tobacco factories. It is the seat of Bethel College (Baptist), an institution established in 1854, and had, in 1901, 7 instructors, 104 pupils and a library containing 6,000 volumes. The town has, besides, Logan College for Women (Methodist). Population 1890, 2,253; 1900, 2,591.

RUSSIAN EMPIRE. For general article on Russia and the Russian Empire, see Russia, Vol. XXI, pp. 73-119.

The Government of Russia is a constitutional hereditary monarchy, but in fact the whole legislative, executive and judicial power is united in the Emperor, who continues to bear the title of Autocrat. On October 17, 1905, however, a Duma, (Lower House), or elective State Council, was created. The Duma consists of members elected for five years and representing the governments and the largest cities. The election of the Deputies is indirect and is made by electoral bodies of the chief towns of governments and of the large cities, composed of delegates chosen by the districts of town elective assemblies. The Council of the Empire (the Upper House) according to a manifesto published on March 6, 1906, consists of an equal number of elected members and of members nominated by the Emperor. The elective members will be eligible for nine years, a third of the number is elected every three years. The Council of the Empire and the Duma have equal legislative power and the same right of initiative in legislature and of addressing questions to ministers. Every measure before being submitted to the Imperial sanction must be passed by both the Duma and the Council. The members of both houses have the privilege of personal immunity during the session.

The administration of the Empire is entrusted to boards or councils. One board is the Ruling Senate. To be valid, a law must be promulgated by the Senate. The latter, the high court of justice for the empire, is divided into six departments. Another board is the College or Holy Synod, entrusted with the superintendence of the religious affairs. A third board is the Committee of Ministers, and the fourth the Council of Ministers, of whom there are fourteen.

Local Government. The Empire is divided into 78 governments. In European Russia the government of the parish is entrusted to the people. For this purpose the country is divided into 18,012 cantons, which are presided over by an elder, elected at the canton assemblies. The village communities elect an elder and a tax-collector. The administration of the economical affairs of the district and province are in the hands of Zemstvos, or district and provincial assemblies. The towns and cities have municipal institutions of their own.

Population. The total population of the Empire numbered in 1906, 149,299,300. The population in cities over 100,000 inhabitants reached the following figures: St. Petersburg, 1,429,000; Moscow, 1,359,254; Warsaw, 756,426; Odessa, 449,673, Lodz, 351,570; Kiev, 319,000; Riga, 282,230; Kharkov, 173,989; Vilna, 162,633; Kazan, 143,707; Saratov, 137,147; Yekaterinoslav 135,552; Kishinev, 125,552; Astrakhan, 121,580; Rostov-on-Don, 119,476; Tula, 114,733.

In 1900 the Jews numbered 4,130,000. Russians, especially Jews, contribute a large part to the flow of emigrants into the United States. The immigrants from the Russian Empire into the United States numbered from 1873-1890, 313,469; from 1891-1900, 525,895, and from 1900-1904, 298,659.

Religion and Instruction. The established religion of the Empire is the Orthodox-Catholic Faith. The Emperor is head of the church, while the Procurator of the Holy Synod enjoys wide powers in Church matters. With the exception of the restraint laid on the Jews, all religions may be

freely professed in the Empire. There are more than 12 million dissenters in Great Russia alone. The affairs of the Roman Catholic Church are entrusted to a Collegium and those of the Lutheran Church to a Consistory.

Most of the schools are under the Ministry of Public Instruction, and the Empire is divided into 15 educational districts. There are 9 universities with (1904) 19,340 students; 4 theological academies, 1 Armenian theological high school, a Catholic college, 6 medical schools, 4 veterinary schools, 3 juridical schools, 1 archæological institute, 3 technical schools, 10 technical institutes, 2 high schools for women, 2 mining, 4 engineering, 4 agricultural, 1 forest, 1 topographic, 5 philological and 6 military schools. Of middle schools, normal schools, seminaries, gymnasia, real schools, there were 1,667. The public schools in 1906 numbered 90,727 with 204,736 teachers and 5,515,185 pupils.

Finance. The Russian Budget for 1906 showed that the ordinary revenue for that year was 2,271,669,948; and the ordinary expenditure 2,061,134,448; extraordinary revenue, 1,084,110,662, and the extraordinary expenditure, 1,151,562,990 roubles. The total national debt on Jan. 1, 1907, amounted to 8,609,577,528 roubles. (The rouble is equal to 51 cents since 1897.)

Army. Military service is universal and compulsory, beginning at the age of 21 and extending to the completion of the 43rd year. There are three armies in Russia, the army of European Russia, the army of the Caucasus and the Asiatic army. The period of service is, in the European army, from 3-4 years in the active army (3 years in the infantry and foot artillery, and 4 years in the other armies); 14 in the reserve or Zapas, and 4 years in the militia or Opolchénié. In the army of the Caucasus (and of Finland) service in the first line is for 3 years, in the reserve 15 years and in the militia to the end of the 43rd year. In the Asiatic army, service is 4 years in the ranks for all arms, 13 in the reserve and 5 years in the territorial force. The field army of European Russia consists of 23 army corps: the Guard and Grenadier Corps, each of 3 divisions; and 21 line army corps, each of 2 divisions. To this must be added 23 infantry reserve divisions. The cavalry comprises 2 guard divisions, 15 divisions of dragoons, 2 "mixed" divisions, a Don Cossack division, and 3 separate cavalry brigades. The field army of the Caucasus consists of 2 army corps, each of 2 divisions, 4 infantry reserve divisions, and 2 divisions of Caucasian Cossacks. One part of the Asiatic army is in Western, the other in Central Asia. It is recruited mostly from military colonists and mobilizes as the first and second Turkestan Army Corps. The largest part of the Asiatic army, however, is in East Siberia, which in the near future will be able to put into the field 6 army corps of about 36,000 combatants each, and 2 cavalry divisions, total, 225,000 combatants.

The Cossacks. A race of Tartar descent, and inhabiting the southeastern part of Russia, hold their lands by tenure of military service to the Crown. After a period of 3 years preliminary instruction, every young Cossack serves 4 years in the line, 4 years in the reserve and 4 years in the militia. The Cossacks of the Don are the most numerous. They furnish 2 guard regiments, 17 regiments of the line and 8 horse batteries.

The peace strength of the Russian army is about 1,200,000 of all ranks, and the war strength about 4,000,000, including the militia. The field armies of European Russia and the Caucasus may amount to 1,500,000, and of Asiatic Russia to 250,000.

Navy. Owing to the enormous losses which the Russian navy suffered during the Russo-Japanese War, the list of war vessels has been greatly reduced. The Baltic fleet comprises 6 battleships, and 2 under construction, 1 coast defense battleship, 12 cruisers, and the Black Sea fleet, 10 battleships and 2 cruisers. There are also in the navy 3 torpedo gunboats, 82 destroyers, 50 torpedo-boats, and 21 submarines. The chief base of the Baltic fleet is Kronstadt and Libau, a new ice-free port in Courland. Headquarters of the Black Sea fleet is Sevastopol. The total number of officers and men is about 60,000.

The Commercial Navy of Russia consisted, in 1904, of 821 steamers of 382,866 tons, and 2,533 sailing vessels of 283,549 tons.

Land Bank for the purchase of land by peasants. Up to Jan. 1, 1905, the bank had made 56,922 loans to village communities, associations, and separate individuals. During the year 1905, 1,070,177 acres were bought with the aid of the bank for a total value of 44,032,428 roubles, out of which 31,031,405 roubles were lent by the bank.

Mining. The products for the year 1905 were: Gold, 28,000 kilograms; platinum, 5,158; silver, 1,999; lead, 526 tons; zinc, 7,807 tons; copper, 8,216 tons; pig iron, 2,669,000 tons; iron and steel, 2,291,000 tons; coal, 18,447,000 tons; naphtha, 6,610,000 tons, salt, 1,813,000 tons.

Industry. The number of manufactories in European Russia proper, on Jan. 1, 1903, was 13,796, employing 1,437,842 working people; of Poland, 2,649, employing 224,045; and of the Caucasus, employing 19,868. Total 16,713 manufactories, employing 1,711,755 people. The cotton industry is rapidly developing, as also is that of wool, in Southern Russia, of the sugar-beet and tobacco industry.

The mileage of the railways opened for traffic, on Jan. 1, 1907, was 40,748, of which 32,743 miles were in European Russia, and 8,005 miles in Asiatic Russia.

Exports and Imports.

EXPORTS—1905.

Through European frontier	(roubles)	978,900,000
Through Asiatic frontier		59,400,000
Trade with Finland		39,000,000
Total		1,077,300,000

IMPORTS—1905.

From European frontier	536,900,000
From Asiatic frontier	70,000,000
Trade with Finland	28,200,000
Total	635,100,000

The imports from Russia to the United States, in 1907, amounted to $17,704,182 and the exports to Russia to $21,782,355.

History. In 1891 Russia was visited by a distressing famine which afflicted 18 governments and some 36,000,000 people. This catastrophe was precipitated by a dreadful drouth, when, for 5 weeks, not a drop of rain fell in the afflicted districts. Blasting winds swept over the fields, blighting all grain. The government did its best to fight the famine, and it was nobly seconded by many of the great land-owners. Substantial aid was sent from America to the amount of about $750,000. Seventy-five millions were given by the government to support the starving peasantry until the arrival of a new crop, and the Czar himself contributed $4,000,000 to the relief fund. Pestilence, however, arrived to add to the horrors of the situation. Typhus and "hunger fever" and cholera made their way up the Volga valley to Moscow, St. Petersburg, and the Baltic. A careful estimate of the cost of the famine in Russia, during the two years most affected, places the figures at $200,000,000. The enforced exodus of Jews from Russia in 1892, during which hundreds of them were expelled from the empire, and thousands more were forced within certain restricted limits, drew down upon the government the criticism of the press of the civilized countries. A prodigious Russian enterprise was the Trans-Siberian railway, begun in 1892 and completed in 1904. This line, 4,950 miles long, links the Empire in a continuous chain from St. Petersburg to Vladivostock on the Pacific Ocean. Emperor Alexander III. died Nov. 1, 1894, after a few months of sickness, and his eldest son, a young man of 26, at once ascended the throne as Emperor Nicholas II, and 25 days later married Princess Alix of Hesse. In celebration of this latter event, the new Czar pardoned 20,000 state prisoners. He and the Czaritza were crowned with most imposing ceremonies inside the Kremlin, in Moscow, May 26, 1896. A terrible catastrophe that caused the death of over 3,000 peasants in an unexplained crush and panic dampened the enthusiasm of the assembled throngs. In 1896 Count Muraview succeeded Prince Lobanov in the ministry of Foreign Affairs, marking a new departure in Russian policies in Eastern Asia. In the same year a treaty was concluded with China, which power granted Russia the right to build the Siberian railroad through Manchuria. In 1897 Port Arthur and Ta-lien-wan were leased from China for 25 years, and in 1898 a treaty was concluded with Japan, granting the integrity of Korea. In 1900 Count Lamsdorf took the place of the deceased minister of Foreign Affairs, Count Muraview. The question in regard to indemnity for the suppression of the Boxer rebellion, in which Russia took part in 1900, and her defying position in Manchuria, made a war between Russia and Japan very probable in 1901. It was only averted by Russia making concessions to Japan. In 1902 Russia made an agreement with China to evacuate Manchuria gradually. In the same year she concluded a treaty with Persia, by which she received permission to establish a Russo-Persian bank at Teherân and to make a large loan to Persia. In 1903 a program for reforms in Macedonia was agreed upon between Russia and Austria-Hungary, which was accepted by the Turkish government. Minister of Finance, Mr. Witte, endeavored to improve the economic conditions of the country but events like the murder of Minister Bogoljepov (1901), and Seipjagin (1902), revolts of students (1901-02) at Moscow, St. Petersburg, Charkov, Kiev and Odessa, and especially the peasants' uprisings in Poltava, Charkov and other governments were symptoms of deep-seated internal unrest. The reforms promised by an imperial manifesto of March 11, 1903, did not materialize, because the originator, Count Witte, had to resign in August, 1903, being in opposition to Minister Plehve's policies.

During the years 1904-05, while Russia had a strenuous conflict on her hands with Japan, the unrest of her people at home occasionally assumed dangerous proportions. Acute stages of the unrest were manifested at various times and places by agitations for reform, protests against the bureaucracy and its tyrannous methods, strikes, riots, secret plots and assassinations. The troubles were the outcroppings of a dissatisfaction that had existed and been growing in intensity for a number of years. Among the direct causes, alleged to have contributed to the discontent resulting in violence, were the government's system of espionage and inhuman punishments, the enforced poverty and distress of the peasantry, burdensome taxation, the censorship of the press, lack of popular representation in the government and the hopeless economic condition of the people attributed to the misapplication of the country's resources. The war with Japan accentuated the grievances and increased the burdens to the limit of endurance.

The organization known as the Zemstvo came to the front in a new rôle, during these difficulties, and demanded a constitutional convention to arrange for a representative government. This action of the Zemstvos called forth a sharp rebuke from the Czar for having exceeded their province. In theory a Russian Zemstvo is an assemblage of the representatives of the three estates of Russia—the clergy, the nobility and the peasantry. Each district of Russia is supposed to be governed by it in local matters, relative to roads, schools, support of the indigent, public health, local taxes and the regulation of the provincial police. In fact, however, the Zemstvo is a mere labor-saving device for the benefit of the minister of the interior, to whom all decrees of the provincial body must be submitted for modification, approval or rejection. As a labor-saving device, the Zemstvos serve a good purpose to the imperial government in working out the details of necessary improvements, plans, expenses, and arrangements for raising revenue. But when they sprang a sudden demand for a free parliament, it was significantly hinted that the existing membership had

no certain tenure of office and that new members might be installed in their places, more pliant to the will of the minister of the interior. Impelled, apparently, by the motive to avoid more serious trouble rather than to favor the demands of the Zemstvos, a few days after penning his rebuke, on December 22, 1904, the Czar issued a ukase to conciliate them, promising justice to all, liberty of the press, and as much self-government as possible. While the Zemstvos were urging reforms in a legal and conservative manner, evidences were not lacking of more extreme measures being adopted in different parts of the country and its dependencies. In Finland, where the Russification policy was particularly obnoxious, deep-seated antagonisms to the imperial government and its representatives were keeping up a continual ferment and, on June 15, 1904, had an outcropping in the shooting and killing of Governor-General Bobrikoff. The Czar, through Minister-of-the-Interior Von Plehve, had declared that the Finnish people should not suffer for the crime, but, from the same source of power, there followed the appointment of Prince John Obolensky to succeed Bobrikoff. Prince Obolensky had the reputation of being one of the most cruel and ruthless administrators in Russia. This appointment evidently did not mollify the bitter hatred already entertained towards Minister Von Plehve, as his assassination in the streets of St. Petersburg on the 28th of the following month, plainly indicated. All through the fall months of 1904, growing discontent was on the increase and a grave internal crisis was imminent. December 11, an anti-government mass meeting was held in St. Petersburg which was dispersed by mounted police and fifty persons injured. Several riots occurred at Moscow and in different parts of Russia during the latter part of the month. The year of 1905 found the empire still in a state of internal dissension, liable to cause eruptions at any moment. An industrial strike of vast proportions was inaugurated at St. Petersburg and throughout northern Russia, and began to take on revolutionary tendencies. At the capital, January 22, nearly 100,000 strikers, under the leadership of Father Gopon, marched to the Winter Palace of the Czar to present a petition, praying for relief from intolerable laws. The authorities were prepared to disperse the petitioners, and more than 50,000 troops, drawn up in the streets and squares, received the crowds, first with a blank volley, and afterward with bullet, shell and saber, killing about 500 men, women and children and wounding eight or nine times as many. The total casualties, it was stated, were not less than 5,000. After the massacre, the strikers entrenched themselves in the streets of Vassili Ostroff, known as Basil Island, north of the Neva, and destroyed buildings, telegraph poles and other property and sacked armories, arsenals and cartridge factories. The mingled chagrin and desire of the people found expression in exclamations of "Down with the Czar!" "Down with Autocracy!" "Up with Constitutional Government!" The wanton slaughter of innocent people, on the occasion of a civil attempt to petition for rights, almost caused a general uprising over the empire. For several days St. Petersburg was practically in a state of siege. The strike spread to Narva, Saratoff and Reval, and the situation at Moscow for a time aroused the greatest fear. At Warsaw, at Mitau and other places troops were called out to disperse strikers and quell riots. Disorders were rife in Russian Poland, and on February 6 Procurator-General Soininen, of Finland, was assassinated at Helsingfors. On the same day, twenty strikers were killed by troops at Kalisz and one at Lodz and a few days later many more casualties were reported from that section. On February 17, Grand Duke Sergius, uncle of the Czar, was blown to pieces by a bomb at Moscow. By the last of February most of the railroads of Russia were under martial law.

Imperial manifestos, promising a constitution (March 3, 1905), religious liberty (April 30), abatement of delinquent taxes to the peasants (April 18), were of no avail. The general unrest culminated (October, 1905) in a great railroad strike. The memorial of Count Witte, now Premier, to the throne caused the Czar to issue the edict of October 17, 1905, granting to a Lower House or Duma the right to make laws and the primary civil rights of freedom of conscience, freedom of speech, including freedom of the press and the right of public meetings, and personal liberty and equality before the laws. Within ten days after the issue of this manifesto, another ukase gave the desired amnesty for political prisoners. Count Witte had agreed that the delegates from all cities and towns to the Duma should be chosen by universal suffrage. The reactionary Grand Dukes also resigned and the obnoxious governors and prefects were removed. The liberal elements became satisfied with the result, but not the socialistic and anarchistic. The whole empire became aflame with revolt from east to west, sedition broke out amongst the Siberian troops, and insurrection in the army and navy at Cronstadt and Odessa. The whole Caucasus was in a state of civil war. On December 22, an open rebellion broke out in Moscow which was suppressed by Admiral Dubassow.

In the meantime Count Witte promulgated another imperial ukase of March 6, 1906, by which the rights of the Duma were restricted and a Council of the State, an Upper House was created.

The elections resulted in 116 seats for the Radicals and 152 seats for the Constitutional Democrats. The Council of State and the Duma were opened by the Czar on May 10, 1906. The Duma at once entered on a bitter fight against the Cabinet of Goremykin who had replaced Count Witte. They asked for a general amnesty, abolition of the Council of State, the establishment of the responsibility of ministers and agrarian reforms by forced expropriation of land. The first president of the Duma was Mourowstev. The government refused to agree to the most of the proposals to the throne, suggesting modifications,

with the exception of universal suffrage. A resolution was adopted by the Duma demanding the immediate resignation of the Goremykin ministry and another one, not to dissolve. On July 23 an imperial manifesto dissolved Russia's first Duma. Premier Goremykin was succeeded by Stolypin. Over 200 members of the Duma went to Viborg where they prepared a manifesto as an answer to the Czar's decree by which their chamber had been dissolved. In this manifesto the deputies appealed to the country not to pay any more taxes or to furnish any more recruits. This was followed by military conspiracies at Sveaborg, Kronstadt and Sevastopol which, however were soon put down with the loss of several hundred lives. The army in general remained loyal. On August 25, an unsuccessful attempt was made to kill Premier Stolypin. On August 26, General Min was shot by a young girl, and on August 27, General Liarliarsky was assassinated at Warsaw. On Sept. 15, General Trepow, the hated governor of St.Petersburg, died probably by poison. In August and September 600 officials met a violent death. From Sept. 8-9, occurred the massacre of 200 Jews at Siedlce, Poland, which surpassed in atrocities that one of Kishinev (April, 1903). In order to pacify the revolutionists, Stolypin introduced agrarian reform by the sale and distribution of crown lands to a peasant's bank. In the elections for the second Duma (Feb. 19) the government by shrewd maneuvers tried to eliminate the radical elements. They resulted in 100 seats for the Conservatives including the Reactionaries and Oktobrists (adhering to the Czar's manifesto of October, 1905), 43 for the Polish Nationalists; 170 for the Constitutional Democrats, and 192 to the Radical group. The Duma was opened on March 5, with President Golovin. The reference to a committee for consideration of the government budget for 1907 and the abolishment of court-marshal by drum head was declared premature by the government. The second Duma was dissolved by an Imperial rescript of June 16, 1907, for refusal to condemn terrorism, for delay in ratifying the budget, for the exhibition of a revolutionary spirit by some of its members and by its failure to comply with the government's demands to exclude 55 Social-Democratic deputies who had held a secret meeting at London, and of whom 9 were at once arrested. With the dissolution of the Duma an organized revolution from below set in which manifested itself in lawbreaking, assaults and robbery. On July 16, General Alikhanov was killed by a bomb. During the past year the number of victims through violence was 47,020 of whom 19,144 were killed, while 60,000 political prisoners had been sent to Siberia.

On August 31, 1907, an agreement was reached with England to restrict Russia's influence to the northern provinces of Persia, and Russia's influence on the Pacific has again been strengthened by an understanding with Japan.

The third Duma assembled on November 14, 1907. In his opening speech, Mr. Komianokov, the new president, declared that Russia was no longer an autocracy but a constitutional monarchy. The third Duma does not contain any Revolutionists, but Social Democrats, The Group of Toil, Constitutional Democrats, Oktobrists, Conservatives and Reactionaries. In the address to the throne the words "supreme head" were substituted for "autocratic head" and "popular representation" for "constitutional representation." The struggle over the budget caused a bitter conflict between Crown and Parliament, which flatly refused the program of the minister of marine for national defence to the amount of $500,000,000.

In December, 1907, Gen. Stoessel was condemned to death for cowardice in surrendering Port Arthur but pardoned by the Czar to ten years imprisonment. In the meantime the Parliament succeeded in holding the balance of power between court and the administration. On July 11, 1908, the Duma adjourned, the emperor declared himself satisfied with the doings of the third Duma. The Duma passed a bill authorizing the expenditure of $46,000,000 for the war budget, and tentatively, of $100,000,000 for that of the next year, for the fortifications of Vladivostock and the building of the Amur Railway.

RUSSO-JAPANESE WAR. Generally speaking, the war between Russia and Japan was the climax of a contention for relative rights, claimed by the one and denied by the other, over territory belonging to neither. A pent-up storm had been vacillating over the waters that wash the shores of Korea and Manchuria for almost ten years prior to its sudden outburst in the harbor of Port Arthur, February 8, 1904. The immediate cause was attributed to Russia's persistent occupation of Manchuria. While this occupation was the ostensible provocation inciting action, the inferences Japan drew from Russia's expansive policy in the Far East, coupled with her well-known desire to secure ice-free ports on the coasts of Korea with control of the contiguous territory, were the underlying causes impelling the attack.

Japan's hopes and ambitions had received a severe blow when she was despoiled of the greater part of the fruits of her victory over China, at the instigation of Russia. Then the latter grew more aggressive, while the little island empire had to be content with verbal objections and unavailing diplomacy until the outbreak of hostilities. The principal starting point leading up to this culmination was incident to and interwoven with the transactions immediately following the close of the China-Japan War of 1894–95.

Reference to some of the salient points of that war, and their relation to the past, is necessary here only so far as to get a clear conception of

their connection with the present subject. Former historical facts of the countries in question can be found under the captions of CHINA, JAPAN, RUSSIA and KOREA (or Corea), respectively, in both the main and supplementary volumes of this Encyclopædia.

Disturbances in Korea in 1894 furnished the occasion for waging war between China and Japan. Korea, while nominally independent, was in a peculiar sense dependent upon both China and Japan. She had in times past paid tribute and homage to both under the operation of suzerain powers. Although, antedating the war, Japan had been dealing with the Hermit Kingdom as an independent nation, China had not wholly abandoned her claims of suzerainty. Each power had special interest in Korea on account of the advantage to each from its location and ties of consanguinity.

In 1876, Japan opened up trade relations with Korea on the basis of friendship accorded independent nations. This act was followed by the leading powers at different periods during the next ten years. In 1885, Japan made a treaty with China that neither country was to land troops in Korean territory without due notice to the other and a mutual understanding relative to the dispatch and withdrawal of the same. In 1894 violent internal disturbances occurred in Korea and the inhabitants split into Chinese and Japanese factions, and China was appealed to for aid to quell the riots. She at once dispatched troops into Korea without informing Japan of her intention and the latter immediately alleged a violation of the treaty of 1885 and sent troops over to drive the Chinese out. In the series of conflicts which followed, Japan not only drove the Chinese forces from Korea, but captured a large part of Manchuria.

In the treaty of peace which was concluded at Shimonoseki, in April, 1895, the independence of Korea was recognized by both parties, and all that part of Manchuria which had been subdued by the conquering armies, including the Liaotung Peninsula (or Regent's Sword) and Port Arthur, was ceded to Japan as part of her spoils of victory. In addition to this, she was granted a money indemnity and the Island of Formosa. Then it was that Russia again became conspicuous in Eastern affairs by interposing an objection to the cession of Manchurian property to Japan. She was sustained in her objection by France and Germany, and, with the advice of Great Britain, sufficient pressure was brought to bear upon Japan to cause her to yield to Russia's wishes. It was plain that Russia did not want Japan for a neighbor, and the latter at once began to view the former's aggressions on Manchurian soil with suspicion. She believed that if Russia got one paw firmly fixed on Manchuria, she would soon be looking for a convenient spot in Korea for the other, and likely cast her eyes across the Korean Straits for other possessions. There could be no question but that Russia desired possession of Korea that she might then open a way by land to ice-free seaports. On the other hand, the independence of Korea and her seaports free from Russian dominance was essential to Japan's future prosperity. The climate, soil and products of Korea make it a country suitable for the surplus population of Japan, and valuable as a trading nation; but, above all, Japan could not afford to have Russia, her arch enemy, in possession of it and its littoral.

During the period elapsing between the time that the Japanese yielded to the demands of Russia to recede the conquered Manchurian territory to China and the outbreak of the war, Japan made continual protest against the tightening of Russia's hold in Manchuria. To strengthen her position she made a treaty of alliance with Great Britain in February, 1902, in which the two countries agreed to do everything necessary to maintain the independence and territorial integrity of China and Korea, and also agreed in case war should ensue, that if other powers should join the aggressor in hostilities against one of the contracting parties, the other should go to its assistance. Aside from this agreement with England, Japan was entirely dependent upon herself for the maintenance of her power and standing among the nations of the earth.

During this same period, Russia was making no open demonstrations of hostility toward the little nation in the sea, but the latter interpreted the former's continual growth of power in Manchuria as an ill foreboding.

The beginning of Russia's occupation of Manchuria was coeval with the franchises which China granted Russia for the extension of her great Siberian Railway through that country and the right to make other improvements in connection therewith. In obtaining grants and leases from China to build railroads in Manchuria, the right to police and protect property thus acquired naturally followed. Subsequent to this period, during the Boxer raid in 1900, the belligerents in Manchuria crossed the Amur River which divides that country from the Russian territory and attacked the Siberian city of Blagovieshtchensk. Russian military forces in Siberia vigorously resented the invasion and crossed the frontier to protect the vast Russian interests in Manchuria. This gave Russia a plausible pretext for increasing her armed forces in that country and she was quick to take advantage of the opportunity. When inquiries were made as to Russia's intentions toward Manchuria, her reply was that she would evacuate as soon as China had furnished guarantees absolutely necessary to her vast interests. A further pretext was furnished Russia for continuing her military occupation of Manchuria at the close of the China-Japan War, claiming that it was necessary for her to remain in possession of the country until the people became pacified and were able to readjust themselves to the new conditions, contingent upon both the disturbances caused by the late war and the necessary innovations on old practices and customs made by Russia, in the course of the improvements effected in that country.

In 1897, when Russia sent warships to Port Arthur, the other Powers manifested some anxiety as to the purpose of the movement to which Russia replied that they were there merely to pass the winter, that being a convenient harbor for that purpose; but they remained not only that winter but continuously for seven winters, when Japan undertook the task of driving them out.

The occupation and virtual annexation of Manchuria by Russia was generally regarded by the world at large as a violation of the pledges given by her government. An arrangement had been effected by which she was to evacuate Manchuria in eighteen months, one-third of their forces in six months, another third in twelve months and the remainder at the end of eighteen months; this was in compliance with a Manchurian convention arranged between Russia and China. There had been, however, during this period, no evidences of Russia's compliance with these arrangements. Finally, the day for her evacuation was set for Oct. 8th, 1903, and several of the other Powers, among them the United States, concurred with Japan in insisting upon her evacuation on that date, but she did not evacuate, and on that very day made a great display of military power, parading with flying banners, music and every symbol of rejoicing. To reconcile the other Powers she assured them that foreign commerce should be in no way interfered with by reason of her aforesaid occupation. In justification of her failure to evacuate the country, according to agreement, she claimed that in every treaty made to this effect there was embodied the phrase: "If action of other Powers proves no obstacle thereto." The inference was that Japan's action was the obstacle which stood in the way of carrying out the treaty provisions.

In addition to Russia's persistent occupation of Manchuria, in defiance of Japan's protest, another exasperating procedure was the Czar's appointment of Vice-Admiral Alexieff as Viceroy of the Amur territory and the Kwangtung Province,—the Port Arthur district. He was empowered with special powers of a very arbitrary and sweeping character. His promotion to this position made him the almost absolute ruler of the country and virtually annexed the province to Russia, the province which Japan had conquered eight years before and was compelled to give up by the pressure of outside influences.

Japan naturally felt resentful toward Russia when she saw the Russian flag flying over territory once hers by right of conquest, and what was still more distracting to her equanimity was the encroachment upon her influence in Korea. Her constant endeavor was to force Russia's retirement from Manchuria and wrest from her the recognition of Korea as a Japanese "sphere of influence." In other words, Japan desired to be recognized in her attitude toward Korea as similar to that of Russia toward Manchuria, but Russia refused to consider such a parallel feasible. Thus the negotiations were carried on but with little prospect of concluding satisfactory arrangements between the two Powers. A noticeable feature of the negotiations, as the relation became more strained, was that Japan's replies and demands were definite, decisive and immediate, and Russia's, while courteous, were vague, evasive and tardy. The relative conditions and necessities of the two nations are at least a partial explanation of this contrast of diplomacy.

With Japan, the demands she was making were vital to her perpetuity as a nation and were plainly within the limits of her just rights. With Russia, her contention did not involve her individual existence or even endanger her prosperity and yet, as national rights were usually viewed, Russia had from her standpoint justification for her conduct. She had material interests in Manchuria which she had legally obtained. She deserved credit for improvements she had made in the country. Its resources had been developed and its civilization advanced in consequence of Russia's operations there. She was entitled to gratitude for all that she had added to the sum of the world's progress, and it was not surprising to find her loath to renounce the prestige these achievements should give her in seeking further commercial advantages. If the interests of Japan alone had been involved in Russia's ambitions, it is probable she would have been more prompt and decisive in conveying her intentions to Japan, but the attitudes of other Powers and their views of international comity had to be considered. She might risk actions which would provoke an attack or declaration of war, but would not be justified in making the attack herself for the purpose of destroying a weaker nation. Japan evidently realized the full force of the situation and met equivocation with direct statement, and disguised diplomacy with frank determination until, despairing of peaceful solution, the issue was referred to the god of battles.

During the month of January, 1904, Russian military forces were gradually being increased in Manchuria and Russian war vessels were anchored in the harbors of Port Arthur, Vladivostok, Dalny and also at Chemulpo, on the coast of Korea, and she had dispatched troops to Seoul, the capital of the above Hermit Kingdom. Japan had been preparing for the conflict, which she saw impending, and when her appeals for her demands failed and the war-like aspect grew more threatening and imperative, she was quick to act, and on February 6th, 1904, the Japanese government recalled its representative from St. Petersburg, and Count Kurino, the Minister, with the entire legation at once withdrew. Russia then immediately recalled Baron de Rosen, her Minister, and his suite to the Mikado's Empire.

The Japanese government ordered Vice-Admiral Togo to sail with his fleet to Port Arthur. He promptly and quietly left Sasebo, a naval station in the Korean Straits, and proceeded to obey orders. In the harbor of Port Arthur lay the flower of Russia's sea power. It consisted of seven battleships and five commerce destroyers. Admiral Togo's fleet consisted of six battleships,

four armored cruisers, six commerce destroyers and a number of torpedo craft. The Russian vessels lay in the outer harbor, an advance guard of torpedo boat sentries being stationed five miles in the offing.

Admiral Togo with his fleet came within firing distance of the Russian vessels between eleven and twelve o'clock on the night of the 8th. Admiral Stark commanded the Russian fleet and, from all accounts, was very much surprised when the attack was made. Admiral Togo's torpedo boats made a brilliant dash at the big battleships of Russia and launched a number of torpedoes which struck the iron-clads named the *Czarevitch* and *Retvizan*, and also the *Pallada*, a protected cruiser of six-thousand six-hundred tons. The damaged ships were sunk in or near the entrance to the inner harbor. As the fire from the powerful guns of the Port Arthur fortifications became heavy, the Japanese fleet floated away until morning. Next day, February 9th, about noon, Admiral Togo's fleet again advanced to the attack and after an engagement, lasting an hour, effected serious damage to the Russian battleship, *Poltava*, and the cruisers *Novik* and *Diana* and *Askold*, all of which were penetrated by shells on or below the water line. After this, the Japanese fleet steamed south out of reach of the guns of Port Arthur. The loss in the two engagements, on the Japanese side, was reported to be four men killed and 54 wounded. On the Russian side, 62 were reported killed and wounded on the ships and four in the coast batteries.

Another battle had taken place on the afternoon of February 8th, the Japanese fleet under the command of Admiral Uriu sailed into Chemulpo harbor, Korea, with 2,500 soldiers and landed them without opposition from the Russian cruisers, *Variag* and *Korietz*, which were lying in harbor. The following day the Japanese consul at Chemulpo conveyed from Admiral Uriu a message to the Russian commander that he must bring his vessels out of the harber and fight or be attacked where he lay.

The *Variag* and *Korietz* steamed out of the harbor and after a brave struggle against the greatly superior Japanese force, both Russian vessels were destroyed with a loss in killed and wounded reported to be over 500.

These naval engagements were the opening operations of a war destined to be fought with a fierceness unsurpassed in the annals of history.

On February 10th, the Czar issued his supreme manifest in which he expressed his deep solicitude for the maintenance of peace and his regret at the sudden termination of negotiations by the breach in diplomatic relations and then said: —

"Without advising us of the fact that the breach of such relations would in itself mean an opening of warlike operations the Japanese government gave orders to its torpedo boats to suddenly attack our squadron standing in the outer harbor of the fortress of Port Arthur. Upon receiving reports from the Viceroy in the Far East about this, we immediately commanded him to answer the Japanese challenge with armed force."

On the same day the Emperor of Japan issued his formal declaration of war against Russia After giving an account of his government's failure to come to any harmonious agreement with Russia, and stating the conditions which it was necessary for Japan to maintain and the proposals they had made to Russia, he said: —

"Russia, however, never met such proposals in a spirit of conciliation but by wanton delays put off a settlement of the serious questions and, by ostensibly advocating peace on one hand while on the other extending her naval and military preparations, sought to accomplish her own selfish designs. We cannot in the least admit that Russia had from the first any serious or genuine desires for peace. She rejected the proposal of our government. The safety of Korea was in danger and the interests of our empire were menaced. The guarantees for the future which we failed to secure by peaceful negotiations can now only be obtained by an appeal to arms."

Immediately following these imperial manifests, Japan and Russia each issued statements to the world reviewing their positions on the questions at variance. Japan spoke of the importance and necessity to her of maintaining the independence and territorial integrity of Korea, and then stated the propositions she had made to Russia, August 12th, 1894, which were as follows: —

(1) A mutual engagement to respect the independence and territorial integrity of the Chinese and Korean empires.

(2) A mutual engagement to maintain the principle of an equal opportunity for the commercial industry of all nations with the natives of those countries.

(3) A reciprocal recognition of Japan's preponderating interests in Korea, and that Russia had special interest in railway enterprises in Manchuria, and a mutual recognition of the respective rights of Japan and Russia to take measures necessary for the protection of their above mentioned interests so far as the principle of article is infringed.

(4) The recognition by Russia of the exclusive rights of Japan to give advice and assistance to Korea in the interests of reform and good government.

(5) The engagement on the part of Russia to unimpede the eventful extension of the Korean Railway into southern Manchuria so as to connect with eastern China and Shanghaikwan-Newchwangs lines.

Russia, in her official note to the world spoke of her effort to negotiate affairs with Japan, and of the fundamental principle of her policy regarding Korea, whose independence and integrity were guaranteed by previous understandings with Japan and by treaties with other powers, Russia insisted on three points: —

(1) On a mutual and conditional guarantee of this principle.

(2) And on undertaking to use no part of Korea for strategic purposes, as the authorization of such action on the part of any foreign power was directly opposed to the principle of the independence of Korea.

(3) On the preservation of the full freedom of navigation of the Straits of Korea.

She further stated, that the project elaborated in this sense did not satisfy the Japanese government, which in its last proposals not only declined to accept the conditions which appeared as the independence of Korea, but also began at the same time to insist on provisions to be incorporated in a project regarding the question of Manchuria. Such demands on the part of Japan she claimed were inadmissible; for the question of Russia's position in Manchuria not only concern-

ing China, but also all the powers having commercial interests in China, made it impractical. The Imperial government, therefore, saw absolutely no reason to include in a special treaty with Japan, on Korean affairs, any provisions concerning territory occupied by Russian troops.

In view of this, the Imperial government, after charging its representative at Tokio to present its reply to the last proposal of Japan, claimed it was justified in expecting the Tokio Cabinet to take into account the consideration set forth above, hoping that body would appreciate the wish manifested by Russia to come to a peaceful understanding with Japan. "Instead of this," the statement concluded, "the Japanese government, not even awaiting this reply, decided to break off negotiations and to suspend diplomatic relations."

A reply to these statements of Russia was embodied in Japan's statement as follows: —

"The Japanese government utterly failed to see why Russia who professed no intention of absorbing Manchuria, should be disinclined to insert in the convention a clause in complete harmony with her own repeatedly declared principle respecting the sovereignty and territorial integrity of China. Furthermore, the refusal of the Russian government impressed the Japanese government all the more with the necessity of an insertion of a clause to the effect that Japan has important commercial interests in Manchuria, and that politically Japan has interests there by reason of its relations to Korea, so that she could not possibly recognize Manchuria as being entirely outside her sphere of interests."

These reasons decided Japan to absolutely reject the Russian proposal, and in further explanation of its views introduced other necessary amendments in the Russian counter proposal. Among these was a stipulation with regard to a neutral zone, that if one was to be created, it should be established on both sides of the boundary line between Manchuria and Korea with equal width, say fifty kilometers. After repeated discussions at Tokio, the Japanese government finally presented the Russian government a definite amendment on the 13th of October. The last reply of Russia was received at Tokio on the 6th of January.

The firing upon Port Arthur and the naval conflicts immediately following not only led to manifestoes of the belligerent powers, but the United States realizing the situation acted promptly, and Secretary of State Hay, with the approval of the President, addressed a note to the Powers asking their concurrence in a manifesto addressed to the two belligerent nations demanding that hostilities be confined to Korea and Manchuria and that the integrity of China be preserved. This proposition was ratified by all nations concerned. The President of the United States, also, issued a proclamation of neutrality, which in a few days was followed by all the nations of wide influence.

The battle of Chemulpo was the preface of another very important movement. Immediately following it the Japanese landed an army of 60,000 men and occupied the Port. It was an orderly, systematic landing and was accomplished with such methodical accuracy that wounded sailors, who had been rescued from the sinking Russian ships, were taken ashore and cared for by the Japanese Red Cross nurses in a Red Cross hospital, erected after the battle had begun. Two days later the advance guard of 5,000 Japanese occupied Seoul and prepared a camp for those to follow.

Admiral Alexieff, who till then had been Russia's Viceroy in the East, was made the supreme commander of the land and naval forces by the Czar. Evghenyi Ivanovitch Alexieff, who was invested with this absolute authority, was born in 1843 of an Armenian father and Russian mother. He was sent to the United States to take charge of his first ship, the *Africa*. He was post-commander of the Pacific squadron in 1889 and was made Viceroy of the Manchurian territory in the summer of 1903, and held this position until his late promotion at the head of the Russian forces in Manchuria.

At this time Russian troops were concentrated in the chain of forts along the north and west banks of the Yalu River, separating Korea and Manchuria and all along the great Trans-Siberian Railroad. Russian citizens hurried from Japan while Japanese who resided in Russian provinces were eager to get away.

After the withdrawal of Admiral Togo, the Russians began to make preparations for his return and placed submarine torpedoes in the channels of the harbor, where vessels unacquainted with their location could not hope to make their way in or out without coming in contact with one of them and being blown to pieces. The disaster these torpedoes would have wrought upon an enemy was illustrated by the Russian cruiser, *Boyarin*, which ran upon one of these mines and was destroyed and the entire crew of nearly 200 men perished.

A few days before this the transport, *Yenesei*, which was engaged in laying mines, made some mistake which resulted in its destruction, with about the same loss of life. The Japanese made another attack upon Port Arthur, February 17th, and destroyed or injured a number of torpedo boats.

After these disasters to the Russians, an official investigation was held at St. Petersburg, from which it was announced that Russian failure in the Far East was due to lack of preparation, and an appeal was made to loyal subjects to be patient until a force could be amassed that would crush Japan. There, also, seems to have been some dissatisfaction with the manner in which Admiral Alexieff had conducted the campaign up to this time, and the next day General Kuropatkin, who had resigned his office as minister of war in Russia, was appointed to succeed the late Viceroy in command of the land forces in the war zone, and Admiral Makaroff was chosen as commander-in-chief of the Russian sea power. Alexieff continued to represent the Czar in civil administration. Harbin, at the junction of the Trans-Siberian and the Manchurian Railways, was selected as the civil capital, and the two commanders were to take up

their headquarters where the circumstances seemed to dictate. Mukden was singled out as a convenient nucleus of the land forces.

Japan was busy every day landing troops in Korea and moving them on toward the seat of war. While the infantry and artillery were making their way toward Ping Yang and the Yalu River, the naval equipment, under Admiral Togo, kept a close watch on Port Arthur, maintaining the semblance of a blockade and occasionally approaching near enough to bombard the forts on the land or fire a few shots at the ships in the inner harbor. Not much attention was paid to this spasmodic firing until it was discovered the Japanese were attempting to blockade the harbor in the same manner Lieutenant Hobson had attempted to bottle up the Spanish fleet at Santiago. Five merchant steamers loaded with stone and explosives were sunk in this attempt but they were scuttled and sunk just outside the passage and failed to accomplish the purpose.

Admiral Makaroff, who had been commissioned to take command of the sea forces at Port Arthur, was considered one of the ablest of Russian naval officers. He arrived at Port Arthur, March 8th, and took command of the Asiatic squadron. He pursued a different course from that of his predecessors and made preparations for attacking his foe instead of waiting to be attacked.

In a naval sortie, two days later, he inflicted the first loss upon the Japanese fleet, and although it was slight and though his own loss was as heavy as that of his enemy, the fact that he met the invaders half way seemed to quiet the fears of the Russians and imbue them with new hope.

The Japanese, however, continued their intermittent attacks and their attempts to block the channel, in the second of which, they were more successful but still left a portion of the channel clear. In the third attempt they were completely successful, having sunk three steamers in such a way as to close the entrance entirely to vessels of heavy draft.

But the greatest loss of the war to fall upon Russia up to this time occurred on April 13th. Admiral Togo set a trap for his antagonists which was said to have worked with terrible accuracy. He had noticed that every time the Russian fleet returned to the inner harbor it followed a certain course that did not seem to him to be the regular channel. He argued that this was done to avoid submerged mines. On a foggy morning he stationed his main fighting force out of sight of the enemy, but within range of his wireless telegraph communication. The ruse succeeded and as soon as Makaroff's vessels passed beyond the protection of the shore guns, the Japanese reserves attacked them, and Makaroff soon saw that he had stepped into a trap and ordered his fleet to port. As his flag-ship the *Petropavlovsk* entered the channel by the usual out of the way course, a terrific explosion occurred. The ship heeled to one side and sunk in less than three minutes. The Admiral, Rear-Admiral Molas and the venerable war painter Verestchagin, as well as 800 sailors, went down to a watery grave. The Grand Duke Cyril, a cousin of the Czar, who was aboard, escaped with slight injuries, as did also the captain of the vessel. It is thought that while Makaroff was engaging the main body of the Japanese squadron, one of Togo's smaller ships planted a mine in the course he knew the Russians would follow in their retreat. A Russian destroyer was intercepted and sunk, and the battle-ship, *Pobieda*, was badly injured in this fight.

By this time news from the seat of war became chaotic and unreliable. A few facts were known, however, one was that more than one hundred thousand of the Mikado warriors were in Korea, but, besides the fact that a division of this number were off on the laborious march to Ping Yang, absolute silence prevailed as to the whereabouts and the objective points of the other forces. That long march was a severe and perilous one.

While this march was in progress, it was reported that the Russian Cossacks had covered the Yalu River into Korea, and were massing to oppose the advance, but the maneuvers on both sides were kept so much in the dark that war correspondents were not able to give definite facts concerning them.

The Japanese occupied Ping Yang with but little difficulty which, however, was but a station in their onward march. From here they pushed forward for Wiju, near the mouth of the Yalu on the Korean side.

Japan had thus accomplished two of her main objects in the early stages of the war. By her naval victories at Port Arthur she opened the entire coast of the war zone to the uninterrupted landing of her forces and supplies. By her march through Korea which, it was reported, had been accomplished in the most orderly manner and with due regard for the rights of the Koreans, she had established Japanese ascendancy in that country, and put her army in a position to maintain it. On their march to the Yalu, the Japanese were frequently attacked by detachments of Cossack troops which, however, occasioned no serious loss but had a tendency to check their progress. This expedition occupied the period elapsing between their landing on the coast, in February, to the middle of April. A writer of war events thus described the existing condition there and the subsequent action: "Arriving at the river which separates the dependencies of the antagonists, it was discovered that the Russians who had occupied Wiju sometime before, had crossed into Manchuria and occupied strongly intrenched positions among the hills on the opposite side. The Japs gathered in force on the Korean side during the third week of April and prepared for the next move, just as they had for their preceding exploits—methodically, but rapidly. Within the next few days gigantic timbers were hauled and dragged to the east bank. The hill forts on the opposite side kept up a steady fire, but even under it the Japanese constructors continued to work on the pontoon bridge by which it was proposed to cross the river. It must not

be imagined that this was done or attempted all at one point. Their forces extended along the river for eighty miles and scattering the fire of the Russians by several false moves intended to mislead. Aided by small boats from the Jap fleet, the crossing of the three divisions of which the army was composed, was accomplished after six days fighting, on May 1."

The crossing, however, is not what is frequently referred to as the Battle of Yalu, or Japan's first victory. Perhaps it would be more exact to say that the crossing was only a part of the battle. The commanding position of the Russians was the hill at Liu Lien Cheng. Here they were strongly posted, their artillery commanding the town of Antung and the road of the Japanese advance.

To concentrate their forces here and to make it all the more difficult for the invaders, they evacuated and burned Antung and kept up their merciless fire upon the Japs. Seeing the necessity for instant action, General Kuroki, who had successfully directed the crossing, ordered an attack on the hill. Up the steep incline the Japs charged with irresistible force, sweeping the Russians from their guns and hurling them back in full retreat toward Feng Wang Cheng. It was Sunday morning at 7:30 when the battle began. At 9 o'clock the Russians broke away from the fierce bayonet encounter and left the Japs in possession of their position and all their field artillery. In this gallant charge, the Japanese lost 800 men, but the loss they inflicted upon the enemy was even greater, to say nothing of the moral effect of the victory and their gain in just the kind of light artillery they wanted. General Zassulitch, the Russian commander, had been ordered not to risk an engagement but to draw the Orientals further and further inland, it being then the hope of Russia that the Japs would overreach themselves, and getting beyond the reach of supplies and reinforcements, fall into a trap from which they could not escape. Though the Russians had the battle brought to him, he was severely censured by his government, and temporarily, at least, suspended from command. The effect of this battle upon the Japanese mastery of Korea was tremendous. On May 19, the government at Seoul announced the official cancellation of all treaties with Russia, and all concessions made by it to Russian citizens.

This battle on the Yalu River is worthy of note as being the first engagement in which an Asiatic army had defeated European troops. For a time it was feared the effect on China would be to increase her Pro-Japanese tendencies to a point of an alliance with her forces, and, although General Ma, who had twenty or thirty thousand men in Manchuria near the scene of hostilities, had difficulty in restraining his men from making common cause with the Japanese, the latter checked this impulse by immediately requesting the Chinese to maintain the strictest neutrality.

After the battle on the Yalu and some severe fighting at Feng Wang Cheng, the Japanese army separated into four divisions and continued its invasion of Manchuria. While the northern Japanese army was carrying out its plans in the upper peninsula, other forces were operating further south and Admiral Togo continued his attempts to bottle up the harbor at Port Arthur. The ceaseless activity and aggressiveness of the Japs led the Russians to evacuate New Chwang, the open treaty port on the Liao-Tung Gulf at the mouth of the Liao River. This, however, was not as striking an evidence of a realization of their relative weakness, compared with the Japs, as was the destruction of the public improvements at Dalny. The "fiat" city of Dalny had been one of Russia's most cherished treasures in the Far East. It was the port most nearly approximating the ice-free conditions desired. Plans for the construction of Dalny had been issued in 1889 and the edict went forth that it should be made the Russian center of Oriental commerce. The best Russian engineers built its docks, its depots and its public buildings; and its break water and fine stone piers, crowned with warehouses, and its elevators worked by electric power, made it a modern city in every respect. It was the chief terminus of the Trans-Siberian Railroad. It was asserted that $20,000,000 had been spent there before the town was open for occupation and commerce. It was the most striking monument of Russian progress in the Far East. Before leaving, so reports from Petersburg on May 12th said, the Russian garrison blew up the spendid docks and destroyed most of the public property so that it might not be of service to the Japs.

But misfortune was also in store for Japan. Three days after the withdrawal of the Czar's troops from Dalny the first-class Japanese battleship, *Hathuse*, one of the finest of Admiral Togo's squadron, ran upon a submerged mine and was blown to pieces. It was estimated that this and other smaller accidents to the Japanese fleet resulted in the loss of 700 men. A still more serious disaster befell Japanese shipping from a Russian squadron which left the port of Vladivostok, late in April, and captured several desirable prizes as well as the transport, *Kinshiu*, laden with coal for Admiral Uriu's ships. The report was that she had lost her way in the fog and mistaking the Russian fleet for her own ships was taken almost without a chase. The officers and some of the soldiers were captured, but it was said about 100 Japs refused to surrender and went down with the ship fighting to the last.

Shortly after the battle on the Yalu, the Japanese landed troops at Kin-Chow on the Gulf of Liao-Tung, north of Port Arthur, but no decisive action was attempted for three weeks, at the end of which time General Oku had been reinforced and had 40,000 well equipped troops with a good supply of artillery. Engagements following toward the latter part of May were thus described:—

"The great Nanshan hills overlooked the town of Kin-Chow far south-east toward the Korean Gulf. These the army of the defense heavily fortified. The best forces Generals Fock and Zalinsky could muster were stationed

behind the breastworks on the brow of the hill. The Japs had to wade ashore under the fire of the men on the hill. They had such protection as the Jap war-ships could give them and the landing was not much impeded. Then, after a few sorties to determine the strength and distribution of the enemy's forces, General Oku determined to take the hill by direct assault. Under a withering fire his men charged again and again. It is reported that at some points the attacking divisions did not stop in their charge until every man was killed. With unprecedented valor and determination, the Japs persisted and finally took the heights. Their commander admits the loss of 4,200 men, but he thought the victory thus gained well worth the sacrifice. The Russians lost 2,000 men.

"Hoping to release the tension on Port Arthur, General Kuropatkin dispatched General Stackelberg southward with an army of 40,000 men. The movement was partly successful in that it diverted attention from the Port. It was, however, very costly, for the relief forces were met by the Jap commander at Vafangow, about eighty miles north of Port Arthur, and after a three days' fight were disastrously defeated with a loss of 3,000 men. The Japs pursued the unfortunate Stackelberg, who found that the northern army under Kuroki had cut its way so far westward as to menace his retreat. It is estimated that Stackelberg's losses aggregated fully 10,000 men, nor did his achievement amount to anything except temporary relief at Port Arthur."

The Vladivostok squadron, under Admiral Skrydloff, which had made several effective raids on the Japanese ships, again became dangerously active in the month of June. Several Jap transports were waylaid and sunk and in one instance 1,400 men were lost.

Readers of current events were forcibly reminded of the possibility of serious internal troubles in Russia by the shooting of General Bobrikoff, governor-general of Finland, on June 15th. The act was done by one opposed to the Russification policy. This condition of affairs was aggravated by the general depression of trade and business and the deep seated dissatisfaction existing with the government's civil and economic policy, of long standing. But whatever may have been the danger of an insurrection at home, operations at the seat of war were being prosecuted with unabated vigor and long distances were being covered with great swiftness. This will be more remarkable when one stops to consider the rough topography of the Manchurian country, and its great extent. The railroad from Harbin to Port Arthur is 700 miles long. Mukden, which had been the administration capital, is almost 250 miles from Port Arthur. East of the railway is a range of rocky mountains and it is over 100 miles from the mouth of the Yalu to Liao-Yang and Liao-Yang is 210 miles north of Port Arthur. Much of the country is an uninhabitable wilderness, picturesque, yet forbidding with its grim peaks and unexplored passes, making it difficult for both Cossack and Oriental to compass the ends in view.

After the battle on the Yalu and while General Oku was making himself master of all the tip of the peninsula, except Port Arthur, the main body of General Kuroki's forces, under his personal command, advanced along the old imperial road toward Liao-Yang. A considerable force under the command of General Nodzu was dispatched to occupy the land between these two. May, June, and the early part of July were consumed in the tiresome marches through the Manchurian mountains.

In the meantime General Kuropatkin alternated between Mukden and Liao-Yang, marshaling his forces and disciplining the recruits that had been hurried to the front.

By the middle of July, the Japanese advance had brought Generals Kuroki, Oku and Nodzu into close communication, making a combined Japanese army of 200,000 men, stretching in a semi-circle of about 150 miles, extending eastward from the railroad. Its northern point was about twenty miles from the railroad, south of Liao-Yang, through Feng Wang Cheng on the east, to within a few miles of Kai-Ping (or Kai-Chow) on the south.

The Japanese campaign had been carefully planned in Tokio under the veteran Field Marshal Oyama — the head of the war department. He arrived at Dalny, July 20th, and took personal direction of the operations against the Russians as commander-in-chief of all the Japanese armies. He did this with the approval of his government, that he might be on hand with counsel in cases of emergency and be in close touch with the army investing Port Arthur.

On July 28th, another event occurred in Russia which was even more significant of a slumbering insurrection than the assassination of General Bobrikoff, the previous month. Minister of the Interior Von Plehve was blown to pieces by a bomb thrown at his carriage, while he was on his way to a conference with the Czar. This minister was one of the prominent members of the Czar's council and his assassination was but another evidence of the great smoldering discontent of the Russian people.

There was a brief cessation of hostilities after the battle of Vafangow, or Telissu, which engaged the land forces, July 14–15. Neither side evidently considered itself as fully prepared as to forces and position it desired for the supreme test of skill and strength.

General Baron Itei Kuroki, since defeating the Russians along the Yalu River, the first part of May, had taken up his army headquarters principally at Feng Wang Cheng. This general, who had been doing such active work along the Korean border at the head of the first army, was a man who had a thorough training both in the school of military tactics and in the field of actual warfare; and he bore into this campaign all the strategy and foresight of a keen intellect and experienced judgment. He was over 60 years of age during these days of his ingenious and tireless exploits.

General Baron Hokyo Oku, who had charge of the second Japanese army during the summer, was 58 years old. He had landed at different points in Liao-tung Peninsula, north of Port Arthur. From there he went south, attacked the Russians at Kin-Chow and defeated them in the battle of Nanshan Hill. This encounter with Russian artillery lasted 16 hours. The loss reported on the Japanese side was 4,200 men, of

which only 750 were killed. There were 60,000 in the engagement. While a besieging force was holding Port Arthur, General Oku turned north and the remaining Russians fled out of the Liaotung Peninsula followed by his pursuing army. The only engagements of any note during this expedition were at Vafangow and Kai-Ping, the latter surrendering to Oku's troops.

General Baron Michitsura Nodzu had command of the third army which formed the link between the forces of Generals Kuroki and Oku. Before reaching this point in the semi-circle previously mentioned, General Nodzu had gone from his landing place at Takushanon the Korean Gulf and defeated the Russians at Sin-Yen, and then proceeding northeastward placed himself in an intermediate position with the allied forces. General Nodzu was said to be a man of mature judgment and wide experience. He was then in his 63d year.

Only one person prominent among the officers of the Japanese army was under 50 years of age, and that was Prince Fushimi, who commanded the first division of the first army. He was 46 years old May 1st, 1904. Of the generals who have passed the half century mark, in addition to those already mentioned, were Field Marshal Yamagata, president of the general staff, 66 years old; Field Marshal Oyama, commander-in-chief of the armies in Manchuria, 62 years; General Katsura, prime minister, 57; General Sakuma, 59; General Nogi, 54; Generals Nishi and Hasegawa, 53; General Yamaguchi, 58, and General Gentaro Kodama, president of the general staff in Manchuria, 52. The last named officer was a lieutenant-general of Japan, and prominent as a strategist. He began his army career at the age of 13, fighting for the Mikado's party, and during the conflict with China in 1894–95, was vice-minister of war. He was governor of Formosa when the war with Russia broke out, and was immediately summoned to Tokio to superintend the mobilization and transportation of troops.

To turn again to naval operations, it was reported and denied and later the report was confirmed, that on July 22d, Admiral Wittshoeft, the commander of the Russian fleet at Port Arthur, attempted to escape from the harbor, but was driven back by the Japs with the loss of the battleship *Peresviet*, the disability of the battleship *Sevastopol*, and serious injury of the cruiser *Diana*.

The successes achieved by the Russian fleets were due chiefly to the excursions of the famous Vladivostok squadron. The ships, *Rossia*, *Rurik*, *Bogyater*, and *Gromoboi*, accompanied with a half dozen or more torpedo boats, had kept up a continuous raiding after Admiral Skrydloff was made commander, early in June. They were well-built and well-equipped cruisers of high speed and thus were able to make raids and get away before Admiral Kamimura, in command of the heavier, slower-moving Japanese war-ships, could get within effective firing distance. Vice-Admiral Bezobrazoff was the actual commander of the Vladivostok squadron which made so many strategic moves and sudden sorties, but Admiral Skrydloff was the guiding genius that planned and directed its movements.

During the last days of July, several fierce engagements were fought between the besieging land forces and the Russian defenders of Port Arthur. It was reported on frequent occasions that Port Arthur was about to be taken, or, that its fall was certain, still, General Stoessel continued to hold the citadel with but few signs of weakening and no tangible evidence of surrendering. Fighting around Port Arthur continued during the month of August, Japanese dash and bravery being met with Russian obstinacy and tenacity. Nor was the fighting confined to the land, but a number of naval engagements had taken place. Details of the battles almost daily occurring on land and water cannot be stated with accuracy, at this writing, owing to the lack of verified information. The fatalities, as a rule, were heavier on the side of the Japanese, they being on the aggressive and more exposed to the fire of the enemy than the Russians who were mostly on the defensive.

While this was the general conclusion as to the losses of the combatants, the Russians had generally constituted the retreating army. If the frequent Russian retreat had been a part of their scheme in order to postpone the decisive conflicts until they were well prepared for the final onslaughts as well as to secure better vantage ground for resisting their pursuers, their seeming defeats may have consisted more of strategy than of failure.

On the sea, the reverses of the Russians were evidently greater than those of the Japanese. One of the notable victories of the latter was the result of coöperation of land and sea forces. Lieutenant-General Nogi, commander of the besieging army, having captured Wolf Hill, a commanding position two miles outside the fortifications of Port Arthur, poured such a rain of shot and shell into the harbor that to avoid the destructive fire the Russian fleet of some eighteen or twenty war vessels sailed out of the harbor, broke through the Japanese cordon and attempted to get into safer quarters. Admiral Togo pursued the fugitives and a three hours battle ensued in which most of the Russian fleet were destroyed or disabled. The Japanese loss was reported 100 killed and 29 wounded.

Eight days after this engagement, General Nogi of the investing forces dispatched his terms to General Stoessel, demanding his surrender. The conditions he proposed were that the troops should march out with the honors of war with the privilege of joining General Kuropatkin's forces, that all non-combatants should be placed in a locality selected by the Japanese and that all the battleships in the harbor of Port Arthur should surrender to the Japan government. The demand was refused and General Stoessel continued to hold the fortress, while the besiegers renewed their efforts to reduce it.

For some time previous to the events just related, the interest which had all along centered in Port Arthur as the citadel whose fate would decide the fortunes of the war, had gradually begun to spread in other directions, especially after the land forces began to gravitate toward Mukden. But the objective point for the first great battle was not Mukden, but Liao-Yang, about forty miles south of Mukden. It was heavily fortified and was further protected by forts on all sides at an average radius of fifteen miles. The Russian commander, Kuropatkin, had intrenched himself in this stronghold and it was naturally expected that a decisive battle would be fought here, for the three Japanese armies under Generals Kuroki, Oku and Nodzu were narrowing their semi-circle in around the Russian forces and a battle was inevitable. It will be seen that the Liao-Yang battle was the logical sequence of the maneuvers and search for strategic points that characterized the land operations. The result of engagements in the last days of July led the Russians to withdraw to a series of positions ranging from twelve to twenty miles distant from Liao-Yang, the most important of these being Anshan-shan, Anping and Liandiansian. For four weeks the Japanese armies made no more movement. Then on August 24th they began an attack on Liandiansian and Anping and by August 26th they had brought their armies all along the line into action. The losses in these fights were probably 3,000 to 4,000 on each side, and by the 27th and 28th, the Russians were ready to quit and fell back to the fortified plains around Liao-Yang. After a day or two of cessation from heavy firing, the grand attack commenced early on the morning of August 30th. Generals Oku and Nodzu on the south and southeast brought all their artillery into play and found repeated opportunities for bayonet charges. Meantime, General Kuroki, with the Japanese right flank, was attempting to cross the Taitse on pontoons close to Liao-Yang. Finding that too difficult, he sent two divisions across at a ford some twenty miles further up, and on the night of the 31st he was able to transfer his entire force to the north bank of the river on pontoons. Field Marshal Oyama's main object was not so much to capture Liao-Yang as to compel Kuropatkin to face the Jap army for a decisive battle and with this end in view he strove to surround the city in a way that would prevent the escape of the Russians toward Mukden. Kuropatkin, on the other hand, evinced clever strategy in compelling the Japs to scatter their forces as much as possible by retreating from one stronghold to another. The fighting around Liao-Yang continued every day from the morning of August 30th to Sunday morning, September 4th, when Liao-Yang fell completely into the hands of the Japanese and the main body of the Russians were going north. While September 4th marks the closing date of the battle of Liao-Yang, there was by no means a total suspension of active hostilities; for, with the Russian retreat toward Mukden and the Japs in close pursuit to intercept their course, there was almost constant conflict with the rear of the fleeing army. The number of combatants engaged in this battle, computed from the most reliable sources obtainable, placed General Kuropatkin's effective forces at from 170,000 to 200,000 men. The Japanese armies engaged, numbered seventeen divisions of 15,000 men each, or, allowing for inefficients, about 240,000 men. Each division had thirty-six guns, and there were two independent artillery brigades of 100 guns each, making a total of about 800 guns. The estimates of Russian correspondents placed the number of guns ranging from 600 to 1,000 a side. The losses of the battle on the Japanese side were given out authoritatively from Tokio at 17,539 officers and men killed and wounded. Of these Kuroki's army, on the right, lost 4,866; Nodzu's army, in the center, 4,992, and Oku's, on the left, 7,681. Total number of officers killed, 136, wounded 464. Information of Russian casualties was less definite, but supposed safe estimates placed the total at 16,000.

This battle, while the greatest of the war, thus far, did not have the decisiveness necessary to make it a turning point in the existing struggle. It is true the Russians, under Kuropatkin, retreated and gave Oyama possession of Liao-Yang; but the retreat was part of the contemplated tactics of the one, and the possession was only part of the achievement hoped for by the other.

Turning again to the scenes around Port Arthur, we find the conflict there continued to rage with unabated fury. The Japanese made attack after attack with a vigor and persistence that evinced an unwavering determination to reduce the fort; while the besieged rallied to the defense with an undaunted bravery or dashed out on their foes in sorties of violence that attested their resolve to fight to the bitter end. Port Arthur is one of the most strongly fortified forts in the world, both by nature and art — a veritable Gibraltar. It is nestled within an enclosure of hills, some of them 500 feet high, resembling an amphitheater, on the tops of which the Russians have erected ramparts of defense, enabling those behind the works to keep at bay an enemy many times their own number. Nothing short of the matchless courage and daring possessed by the Japs and the vital cause that fired their fortitude could have induced an army to persist in assaults against such an impregnable stronghold.

It was estimated by London authorities that the Russian garrison under General Stoessel — excluding non-effectives — amounted to 28,000 men in June, 24,000 in July and 17,000 in September. The Japanese forces under General Nogi were estimated from 80,000 to 100,000 men.

From the meager reports of the almost constant warfare around the fort, it was learned that on August 27, during a violent thunderstorm, the Japanese vigorously attacked the flank positions but were met by a raking fire from behind the fortifications that repelled them. They were also repulsed September 1, in another attempt to

storm a portion of the fortress; but on September 12, they took one of the most important forts on the slope of Golden Hill. This opened another vantage position for attacking the city and added another link to the proposed Japanese circuit within gun shot around the besieged. Another series of attacks began September 19 and continued for four days, the fighting being of an extremely severe character. It was reported that the Japanese had captured nine minor forts, part of them lying close in to Etse-shan and Antszshan and part south of Wolf Hill. These latter controlled the water works of Port Arthur and gave the Japanese a new point from which to make attacks either upon Antszshan to the west or upon the strong Keewan forts to the east. Following the report of these victories were accounts from St. Petersburg of the retaking, by sorties from the forts, of the positions gained and terrible slaughter of the Japanese. In one instance it was reported that in a Russian sortie on a Jap position held by 4,000 men all the latter were killed but one non-commissioned officer and eleven men. The Russian estimate of Japanese losses for four days fighting was put at 20,000. During the series of attacks the Russians attempted to recapture Itzeshan by a detachment from the garrison but were repulsed with heavy loss. On September 24–25, the Japanese made repeated and daring attempts to capture a high hill at Port Arthur and being in an exposed position the Russian machines swept them down in masses, but more troops followed and with nothing daunting, leaped over the dead bodies of their comrades and faced the galling fire from the forts until they enticed the Russians to make a sortie: and when the latter came out from under their shelters, the Japanese turned their machine guns upon them with terrible havoc. Next morning the hillside was strewn with mangled Russian and Japanese bodies.

While the wavering fortunes of war were swinging between Russ and Jap around Port Arthur, on sea and land, portions of the armies in the north were coming together in skirmish sallies, rear attacks, routs and repulses, as the forces were marshaling for another great battle. A notable change in the general tactics of the Russian army was made, October 2, when General Kuropatkin decided to assume the offensive.

The scene of the impending conflict lay between Liao-Yang and Mukden and in the vicinity of the rivers Hun, Taitse, Schili and Shakhe, the general course of the first being south, the second south, then west and the two latter west: the last three emptying into the Hun. In compliance with Kuropatkin's orders, the Russians began to make occasional forward movements. His eastern advance guard was in the vicinity of Bensihu and on October 8th crossed Taitse River. Rentsiaputze, southeast of Mukden, and Shakhe, on the Mandarin road were occupied on the 9th, and further advances were made on the 10th. That night, however, Oyama decided it was time to strike and early in the morning the great battle near Yentai mines was begun

A general engagement lasting nine days followed, resulting in heavy losses on both sides and closing on the 19th on account of heavy rains and impassable roads. Engagements took place on a line between fifty-five and sixty miles long, and the line of battle proper, where the fighting was severe and continuous was twenty-five or thirty miles long. The Hun River on the north and west and the Taitse on the east and south mark out the field in a general way. General Kuropatkin utilized every military resource available Russia had in the Far East. Estimates of his strength ranged from 200,000 to 250,000 men.

October 10th, Kuropatkin, in full force crossed the Hun River where it flows easterly, south of Mukden. The next day a larger force crossed the Schili and the fighting that day was very severe to the north of Yentai. General Nodzu took the offensive October 11th and began to force the Russians back. October 14th General Oku's forces, which came from the Liao River and crossed the Hun for that purpose, turned the fortunes of battle towards the Japanese. On October 17th, the Russians made some gains in the prolonged battle. The most notable was the occupation of Lone Tree Hill and the attempt of the Japanese to recapture it was a gallant and brilliant feat of arms. Victory fluctuated from side to side and on the cessation of the firing neither side could claim decisive and permanent gains. Losses on both sides were estimated from 40,000 to 65,000 men. This engagement was called the battle of Shakhe, or Sha, River, and in some respects was one of the most remarkable battles of modern history. Its particular feature was the long-continued test of endurance on both sides. Men fought without sleep, even without rest, day after day.

For several weeks following the exhausting battles on the Shakhe, the forces on both sides refrained from active operations for the purpose of recuperating their losses, although each of the commanders, Marshal Oyama and General Kuropatkin, made frequent feints with a view of finding his adversary's weaker points. At times the two armies were drawn up so close to one another that the outposts were said to engage in petty trade, and have contests in wrestling and boxing matches. Winter weather was prevalent through November at the scene of conflict, but food, clothing and other supplies were sufficient, and on both banks of the river, trenches and bomb-proof retreats had been dug while each of the vast armies was waiting and watching for a favorable opportunity to attack the other. Both sides received reinforcements and supplies for future emergencies; the Japanese hopefully looking forward to the fall of Port Arthur, when they would receive the accession of General Nogi's forces to augment their ranks for the next aggressive campaign, and the Russians utilizing the Trans-Siberian railway to its full capacity in hastening recruits and provisions to the base of operations.

The recall of Admiral Alexieff to St. Petersburg, about the middle of November, left General Kuropatkin in full command of the Czar's military

and civil subjects in the Far East. General Linevitch, who up to that time had been in command at Vladivostok, was given charge of the First Army, while the Second and Third, respectively, were to be placed under the commands of Generals Grippenberg and Baron Kaulbars. With this re-organization of the Russian forces and their complete equipment for vigorous action, the Czar expressed the belief that his gallant soldiers were about to inaugurate a campaign that would administer the crushing blow to Japan. But the Japanese, neither dismayed by their enemy's recuperative strength nor willing to yield a single point, were alert to every movement and ready for any emergency. They had planned from the first, among other things, to absolutely checkmate the tendency of Russian domination in Korea, limit Russian influence in Manchuria, capture and re-possess Port Arthur, and no obstacles or opposition could swerve them from their purpose. During the last part of the year 1904, no decisive engagements had taken place between these two armies, although frequent skirmishes, as straws show the direction of the wind, indicated a converging of battalions for a Titanic struggle in the vicinity of Mukden. In the meantime, attention was being riveted on the desperation surrounding the investment of Port Arthur.

The Fall of Port Arthur.

A coherent narrative of any one center of activity, in a great war, is often impossible, except by a partial recapitulation of events previously mentioned in a contemporary review of the whole field of operations. The momentous consequences hinging on the fate of Port Arthur justifies such a repetition, along with the elucidation of other facts. Among the prominent occurrences after the attack on the Russian ships off Port Arthur by Admiral Togo's torpedo fleet, February 8, 1904, were the naval exploits as previously detailed up to March 8, the arrival of the Russian Admiral Makaroff at Port Arthur, and his active naval warfare from March 9, to April 13, when he went down with his warships under the fire of the Japanese naval guns.

May 10.—Admiral Togo bombarded the city from behind hills to the westward, and May 26–27, Kinchow and Nanshan Hill were captured, cutting off Port Arthur from the Russians. May 30, Japanese took possession of Dalny. June 14–16, General Stackelberg, advancing to the relief of Port Arthur, was driven back by General Oku, at the battles of Wafangkau and Telissu. June 23–24, sortie of Russian squadron failed. July 10, Japanese torpedo boat attack repulsed. Japanese occupy Kinsan heights. July 22, Fourth Japanese army landed at Port Dalny. July 26–28, fierce combats on land and sea resulted in the Japanese taking Wolf Hill. August 10, dash of the Russian fleet and fight with Togo's ships; vessels of the former damaged and scattered. August 14, cruiser *Rurik* was sunk in Korea Straits by Admiral Kamimura's squadron and fierce fighting at Port Arthur continued. The next day, Sushiyan, Long Mountain and White Wolf Hill were captured, completing the Japanese envelopment of the fortress. August 16, General Nogi suspended operations and made official demand of General Stoessel to surrender, but on the following day the latter sent back his refusal and fighting was resumed. August 18, the Japanese captured several Pigeon Bay positions. August 21–22, Panlung Mountain, and on August 27, Russians attacked entire Japanese line and were driven back.

After the capture of Wolf Hill by the Japanese the latter part of July, an eminence within two miles of the inner fortifications of the city, and from which the heavy siege guns could bombard the city, fire into the harbor and disperse the Russian fleet, it was not thought Port Arthur could remain more than a month longer in the hands of its brave defenders. But General Stoessel, commander of the beleaguered forces, evidently did not share this opinion. He knew that, although the Japanese had won a number of advantageous positions, despite galling fires and powerful fortifications, that they would have to overcome a still greater number of formidable obstacles before they could wrest him from his stronghold. For every outpost yet taken there were half a dozen others still more forbidding and dangerous of approach. With every pass between mountains guarded with batteries and field guns; with forts surrounded by intrenchments and electrified barbed wire, contact with the latter being extremely dangerous, if not fatal; with deep and wide moats, for trapping the venturesome enemy and along these occasional caponieres constructed, from which hiding places sharpshooters could pick off assailants at leisure; with torpedoes under outposts and machine guns behind walls ready for instant action; with not one but a dozen or more lines of fortresses equipped with all the diabolical engines of death known to modern warfare, still to be met and captured, and, back of all these equipments of defense, with a band of men, brave as the bravest, ready to contest every inch of the way with invaders, there was plausible ground for General Stoessel's hope of final success. Such were some of the obstacles the Japanese had to meet and overcome before entering the Gibraltar of the Far East.

It was estimated from reports of the numerous conflicts, consequent upon storming the forts surrounding his objective point, that General Nogi lost 25,000 men, during the month of August. Undaunted by repulse and fearless of death, the Japs struck blow after blow, not alone with the stolid tenacity that knows only "to do and die," but with all the tact and strategy determination could inspire or ingenuity devise. Yet it was an unequal struggle with a concealed foe whose allies were underground mines, treacherous traps and live wires. The overland attacks were too costly in human lives, if other means could be devised to lessen the slaughter while accomplishing the end. President-of-the-Staff Kodama and General Nogi put their ingenuities to the test and the result was

a scheme to tunnel and trench passageways to the inner fortresses and incidentally undermine and blow up the monster forts. Engineers gave directions and a hundred men with pick and shovel —all that could work at one time— were detailed to begin. Operations had to be carried on in the darkness of night and with the utmost caution and quietness. Many fell victims to the enemy's bullets, but others were ready to fill their places and take turns with the fatigued, so that the full quota was always at work. For two months or more the work of tunneling the mountains and zigzagging the valleys with trenches proceeded with unabated vigor, while advanced positions on the ridges, far beyond the click of the pick, were being held and other conquests made with dogged persistence. Through these tunnels and intrenchments, army ingress to vantage positions was effected with comparative safety and hastened the final consummation in view.

On September 19–20, the Japanese made another general bombardment, and, along with other fortifications, took Forts Suishiyeng and Kuropatkin. A week or ten days later, the Russian fleet in the harbor was bombarded and the battleships *Poltava*, *Peresviet* and *Pobieda* were hit several times. During the latter half of October, beginning on the 16th, another fierce bombardment was carried on, during which the Japanese stormed and captured a fort on Rihlung Mountain and engaged the Russians on Shungshu Hill in a lively combat. On October 24, the Russians dynamited the Japanese in their trenches east of Keekwan Mountain. The Shungshu, Rihlung and Keekwan forts were bombarded on the 26–29, causing great destruction to the defenses. The Japanese having stormed Etse Mountain on the 5th of November, were repulsed the next day with heavy loss. On the 13th of the same month, the Russians, in a desperate nocturnal sortie, attacked the Japanese, with the result of heavy losses on both sides. November 22, a position on Etse Mountain was captured by the Japanese, and on the 26th they entered the interior works of the forts, Rihlung, Shungshu and Keekwan, but were driven out. Among the important positions around Port Arthur taken and held by the Japanese during the siege and series of battles of the fall months, the climax was reached in the capture of 203-Meter Hill the last day of November. This eminence dominates both the harbor and the city, and its occupation by the Japanese practically sealed the doom of Port Arthur. No battle had been fought with more fierceness and determination, and the loss of men to General Nogi was the greatest he had yet suffered in a like period of time, the estimate being 15,000 in four hours. To the casual observer it seemed like a victory dearly bought, owing to the difficulty of mounting guns on its rugged heights, but to the Japanese it was the priceless vantage ground they were determined to have at any cost. Once in their possession, they began to haul up their artillery with ropes; 800 men to a gun, it was said, was required to take them up the steep acclivities and mount them for action. They got them in positions, where, by a dexterous use of the hyposcope, they could fire into Port Arthur and shell the harbor. The Russian warships, under Admiral Wirenius, lay in the harbor, and, after forty-eight hours' bombardment, December 6–7, from 203-Meter Hill, the battleships *Pobieda*, *Retvizan*, *Peresviet* and *Poltava*, the cruisers *Bayan* and *Pallada*, and the gunboats *Giliak* and *Amur* were destroyed and sunk. One battleship was left afloat, the *Sevastopol*, but two Japanese torpedo boats ran it down several days later and disabled it, and thus completed the destruction of Russia's navy at Port Arthur.

A few gunboats and destroyers had escaped, and some hospital ships and transports were still in the harbor, but the fighting force was effectually wiped out. The Japanese torpedo boats, which disabled the *Sevastopol*, were afterwards lost, and the Japanese cruiser *Saiyen* was, on November 30, destroyed by a Russian mine, which sums up the Japanese naval loss during this period.

The garrison at Port Arthur, notwithstanding the Russian reverses, still held out, and fought desperately to forestall further invasion by the enemy. December 7, General Stoessel made a bold attempt to recapture 203-Meter Hill, and was said to have lost 3,000 men in the sortie, the attack ending in failure. But General Nogi's undertaking was not yet completed, and he fully realized, before capturing 203-Meter Hill, that with that in his grasp, there would be more battles to be fought and ramparts to be taken before the gates of the city would open to receive him. The tunneling and trenching that had enabled him to get parts of his army in positions of advantage, that otherwise would have been impossible without appalling loss of life, had a counterpart in the sapping of forts instead of the hazardous and sanguinary method of open attack. The undermining and blowing up of East Keewan fort illustrate the process of sapping. The Japanese had possession of a battery near where East Keekwan stood dominant, grim, demon-like, defiant, unapproachable. The engineers started straight down through the solid rock. It was a long and irksome task; for only a few men could work at a time, and then only when the trench from which they operated was protected by their comrades against onslaughts from the garrison. In spite of the incessant and vigorous firing kept up by the sentinels on guard, to keep down the garrison, the Russians would occasionally break forth in midnight attacks, or whenever they had hope of catching the sappers unaware, but the work went on for more than a month, when, hounded and harassed by day and night, a shaft was at length sunk 40 feet deep, and then a tunnel across under the level of the galleries of the fort until the right point was found for placing dynamite. Two such tunnels were dug, and enormous quantities of explosives were taken in and ingeniously disposed. It was the 18th of December; all was quiet in the deep

dug-out where men had hid, crawled, labored, struggled, suffered, and endured, to realize one supreme moment, to break another link in the chain of anchors holding Port Arthur. Silently the engineers withdrew from the termini of the tunnels, ascended the dark shaft, saw that wire connections were made and, giving assurance that all was ready, a button was touched, the earth shook; rocks, timbers, cannon, bodies, arms, legs, in one chaotic mass flew far into the air, and then settled back on a heap of ruins, over the foundation of the once impregnable fortification. Another fort fallen, another stronghold taken, another barrier removed from between the Japanese army and its goal.

Other forts still remained to bar the way of the invading forces, but the mines, the tunnels and the trenches, mute evidences of resolution as well as artifice, were being extended and, most important of all, the invincible Jap, the faithful, courageous boy of the island nation, glad to live and fight or fall and die for his native land, it was he who made Japan triumphant through all the trying ordeals of a fiercely-fought siege. From one tier of embattled heights to another, from mountain-locked fort to improvised barricade, from moat to parapet, the Japanese soldier was now everywhere in evidence, breaking through the outer cordons and hastening on to storm the innermost citadel. On December 24, the heights east of Houyangsnukou were captured and, following the taking of several minor positions, occurred the final fruitless struggle of the Russians to hold Rihlung fort on mountain of same name, December 28, the capture was made after months of fighting, sapping and mining. The Japanese had placed seven dynamite mines under the front wall, and through the breaches made by the explosions, a large body of Japanese troops charged under cover of a tremendous bombardment and captured the first line of light guns, and constructed defense works despite the enemy's fierce fire. The first charge was made at 10 A.M., and at 4 P.M., their occupation being practically assured, they charged and occupied the inner lines of heavy gun position, subsequently dislodging a remnant of the enemy's force and stubbornly holding the gorge fort, which they occupied until they captured the entire works.

Rihlung fort, situated on Rihlung Mountain, formed part of the inner circle of the chain of forts defending Port Arthur. Rihlung is situated about two miles from the outskirts of the city from which it bears due northeast and is a mile-and-a-half southeast of East Keekwan fort taken on December 18. The possession of these two forts made a most important breach in the fortifications of Port Arthur and cut off communication between the Golden Hill forts and the forts of the western section of the inner circle of fortifications. On December 31, Shungshu fort, another important stronghold, was taken by storm.

These sweeping conquests, following in the wake of the great victory of 203-Meter Hill and the destruction of the Russian fleet in the harbor, foretold the speedy and inevitable fall of Port Arthur. It was now the fifth day of an assault that had been kept up without ceasing within the fortifications of the doomed garrison. The Russians, in the last throes of desperation, fought like enraged tigers and the Japanese, stimulated by success and bent on administering a final effective blow, rushed like maddened demons into the jaws of death to wrest the last hope from their valiant foe. At 6 in the evening of December 31, an assault on the whole eastern side was renewed with terrific vehemence. A mine made an opening in the side of "H" Fort, and the Japanese infantry, piercing the covered way, rushed in. Fighting lasted all night, the Japanese pushing against the whole ridge simultaneously. The Russians resisted every point but were slowly driven back. The new year broke with the antagonists still locked in conflict, and dawn broke before the resistance had ceased. Then the Japanese had firmly stationed gun positions on Panlunshan and the fort. The city was now open to the Japanese at this point, for the remaining defenses were slight and temporary. At 9 o'clock in the morning, the first center left column attacked Wantai. Nogi's artillery was cleverly used to screen the advance, and by using its protection, the Japanese reached the fort, but so stubborn was the resistance that not until 3:35 o'clock in the afternoon did the Japanese fully occupy the position, fighting of the fiercest character having been maintained for over six hours without ceasing. Attacks on the forts to the southeast were carried on simultaneously and soon after midday, January 1, there came an explosion in Kinkishan fort. The Russians there immediately opened a heavy rifle fire, which soon ceased. The Japanese scouts advanced and found the enemy evacuating the position. The slacking of fire in the northern and western forts indicated that the Russian ammunition was failing. Wherever there was a garrison, a fort in the hands of the Russians or a squad of soldiers there was fighting — firing, bayonet charging, stone hurling, hand-to-hand combat; the garrison positions becoming more and more desperate and hopeless. Late in the afternoon the counsel of officers prevailed upon General Stoessel to surrender. Regretfully but inevitably he approached the crucial moment, but the decision to yield was made, and at 5 o'clock Sunday afternoon, January 1, 1905, Port Arthur passed from Russian into Japanese possession.

General Stoessel at once dispatched a Russian messenger, bearing a flag of truce into the first line of the Japanese position before Port Arthur, who handed a letter to the Mikado's officers, containing an offer to surrender, as follows:

"Judging by the general condition of the whole line of hostile positions held by you, I find further resistance at Port Arthur useless, and for the purpose of preventing needless sacrifice of lives, I propose to hold negotiations with reference to capitulation.

"Should you consent to the same, you will please appoint commissioners for discussing the order and conditions regarding capitulation, and also appoint a

place for such commissioners to meet the same appointed by me.

"I take this opportunity to convey to your excellency assurances of my respect. STOESSEL."

The Japanese acceptance was returned in the following words:

"I have the honor to reply to your proposal to hold negotiations regarding the conditions and order of capitulation. For this purpose I have appointed as commissioner Major-General Ijichi, chief of staff of our army. He will be accompanied by some staff officers and civil officials. They will meet your commissioners January 2, noon, at Shuishiying. The commissioners of both parties will be empowered to sign a convention for the capitulation without waiting for ratification, and cause the same to take immediate effect. Authorization for such plenary powers shall be signed by the highest officer of both the negotiating parties, and the same shall be exchanged by the respective commissioners. I avail myself of this opportunity to convey to your excellency assurances of my respect. NOGI."

As soon as word of Stoessel's surrender could be communicated to the firing lines, hostilities were suspended and the demons of an hour before, shooting, wounding, slaying, were transformed into veritable angels of mercy, helping, nourishing and relieving, regardless of friend or foe. General Nogi received the note from General Stoessel at nine o'clock of the same day it was written and immediately sent back his reply. The capitulation commissioners met January 2, according to appointment, and arranged terms of surrender. The terms stipulated that the Russian army and navy should be permitted to retain their swords and return to Russia on signing a parole not to take arms during the continuance of the war; that all Russian soldiers, marines and civil officers of the garrison and harbor be made prisoners; that all forts, batteries, vessels, munitions, etc., be transferred to the Japanese in the condition in which they existed at noon, January 3; and that for the benefit of the sick and wounded Russians, the sanitary corps and accountants belonging to the Russian army be required to serve under the Japanese sanitary corps for such time as may be deemed necessary. The terms were accepted and in a few days afterwards Japan took formal possession of the city and its belongings.

The losses sustained in the siege of Port Arthur will probably never be accurately written on account of the intricacies attending the operations, the number of attacks and repulses and the lack of reliable statistical reports. One correspondent claims that 75,000 men died in the struggle and that three times that number suffered from wounds. Oyama reported that the total loss of the Japanese during the five months' siege, beginning with August, was 50,000, and the Russian loss about half that number, these estimates including the killed and disabled. There were many losses not included in the sum totals, lost in battles and attacks, for there was almost constant firing and counter firing and shelling in which no reports were made of losses. It was estimated that the Japanese fired 2,000 tons of shells into Port Arthur, amounting in value to over $30,000,000. The Russians used about the same amount of ammunition in defending themselves. General Nogi's forces during the siege were variously reported, at different times, from 100,000 to 70,000 men. Some statistics regarding the Port Arthur forces under General Stoessel, made the army originally number 35,000. Of these, it was said, 11,000 had been killed, 16,000 wounded or sick and 8,000 remained in the forts, of whom 2,000 were unable to fight. After the surrender, it was said the prisoners numbered 878 officers and 23,491 men, which would indicate a larger fighting force in the Port Arthur garrison than had been given out. On this basis and other data, one correspondent estimated that General Stoessel had, at the beginning of the siege, an army of 75,000 men. The Russian estimate of Japan's expenditure of money to take the fortress was placed at $100,000,000. Russia's expenditure in defending it was probably not much less, and in addition to the actual outlay in maintaining the garrison and its supplies, connected with the loss of Port Arthur, was the loss of seven battleships and the other complement of a fleet worth something near $100,000,000. Russia also lost the fine modern city of Dalny upon which she had spent $125,000,000, and Japan possesses this rich prize of war. Russia lost and Japan gained one of the most elaborately constructed fortifications in the world, and likewise another modern city at Port Arthur, on which an outlay of $250,000,000 had been planned by the Russian Empire and on which $140,000,000 actually had been spent when Admiral Togo hurled his destroyers against the squadron in the harbor, February 8, 1904. Russia lost and Japan came into possession of the railroad, with its branches, from Port Arthur to Liao-Yang, another item running into millions in favor of Japan.

The memorable siege of Port Arthur may be said to have begun with the attack of the fleet by Admiral Togo, but the investment proper had different stages of intensity, and was most desperate during the last five months of the siege. History, however, will doubtless record it as one long, brave assault and valorous defense, of unparalleled human daring and sacrifice, from February 8, 1904, to January 1, 1905. In recording it as one of the momentous sieges of the world, facts will also demand that it be designated as one of the most heroic; for never before did indomitable warriors cross swords with greater fortitude and daring. Never before did men confront men with such mighty engines of destruction on one hand, such colossal and artfully contrived works of repulse on the other.

Sieges of the past have stamped their impressions on the records of time — Troy, Carthage, Antwerp, Sebastopol, Richmond, Paris and others. Deeds of heroism celebrated in immortal verse; maps of nations changed; epochs in history made. Greater things than these may follow the strife which has accentuated the tragic horrors of war, the magnificent valor of the soldier and the noble character of the victor in the siege and capture of Port Arthur.

A GENERAL LULL in activities followed the

capitulation proceedings, after the clash of arms that ushered in the New Year at Port Arthur had died away. This was true of both land and sea operations, and while the armies in Manchuria were watching each other with eagle eyes, the characteristic calm that follows a great storm for a time prevailed; although there was not an absolute cessation of hostilities. Some talk of peace was noised abroad and diplomats of leading nations believed the time opportune and expressed hope of such a consummation. Japan manifested a willingness to negotiate, if the initiative were taken, but Russia, humiliated by defeat, and still resting on the hope of final victory, gave but little encouragement to a conference in which terms — however generous they might be — would be dictated to her by a smaller, if not a weaker, nation.

During the greater part of January and into February there had been but few engagements of importance between the armies of Oyama and Kuropatkin, and less general activity than at any other period succeeding the battle of Liao-Yang. The Russians were increasing their forces and the imperial budget issued at St. Petersburg showed that $310,500,000 had been set aside to prosecute the war in 1905. General Nogi and his 100,000 veterans of Port Arthur had gone to the northern scene of conflict and by the middle of February, had re-enforced Marshal Oyama's army, thereafter to be known as the Fourth Japanese Army. The other three Japanese armies maintained the same relative positions in which they had fought their way from Hai-Cheng northward. In addition to these four large armies, a fifth army had been organized under the command of General Kawamura whose operations were then in the vicinity of Vladivostok. The Japanese had rushed up their heavy artillery to employ it against Kuropatkin's army, and a considerable increase had been noticed in the range of fire.

Referring to the leading occurrences in Manchuria during the mid-winter period, it was observed that the Russians did considerable bombarding on the Japanese lines but without striking any very effective blows or protracting an attack long enough to enlist a general engagement. While the Japanese were still celebrating the victory at Port Arthur the Russians turned their guns on them at favorable points; a significant reminder that the war was not over yet. January 8, General Mistchenko, with about 3,000 mounted Cossacks, crossed the Hun River and went south on a raid for the purpose of cutting off the Japanese lines of communication. He succeeded in capturing a few small transports and in cutting the railroad and telegraph lines in some places, but the damages done were soon repaired and in nearly every instance, when his troops encountered the Japanese forces, they were compelled to retreat. The casualties of the raiders were much greater than those inflicted upon the enemy. On January 29, the Russians bombarded the Japanese at Sandepas and suffered a defeat. February 1, there was some fighting along the Hun River, but without any decisive results. On the 8th, the Russians made a raid across the Taitse, attacking a division of the Japanese army, but returned before either side had a chance to score a success. On the 14th, the Russian cavalry, 9,000 strong, advanced to attack the Japanese army and attempted to cross the Hun River and move on Heikoutai. The Japanese mounted heavy field guns and opened fire on the Russian front, repulsing several attacks. The immense armies of Oyama and Kuropatkin were now fronting each other along the Shakhe and as the attacks became more frequent and vigorous it was evident a general engagement was imminent.

The Battle of Mukden.

While it is difficult to set a precise date for the beginning of the battle at Mukden, February 23 may be designated as the day on which the series of battles that had involved various sections of the forces assumed the proportions of a general engagement between the two great armies.

The generals engaged in this battle were, Japanese: Kuroki, Oku, Nodzu, Nogi and Kawamura; Russian: Linevitch, Kaulbars, Rennenkampf, Bilderling and Stakelberg. Both Russians and Japanese were within a few miles of Mukden, the sacred city of Manchus, which has an estimated population of 250,000. It lies in a plain bordered on the west and southwest by the Hun and Liao rivers. Before the general engagement began, the Russian and Japanese lines had formed a huge bow or crescent, the Japanese to the southward, extending over a hundred miles of plains and hills, from Chang-Tan eastward across the railway to Lone Tree (Putiloff) Hill. Almost all the strong positions were held by the Russians. On the 23rd of February the Japanese armies were attacking the Russian front nearly all along the line. Kuropatkin had massed a large force on the Russian left in an attempt to turn Kuroki's position, but had been outflanked and was compelled to retire from the Shakhe. On the 24th, the Japanese closed in on the Russian left flank and the Russian outposts were driven into the main positions.

The Japanese attack on Beresneff Hill against the Russian left flank, February 25, developed into an encounter of the most sanguinary nature. The Japanese pressing forward on a bayonet charge, were received with pyroxylin hand grenades, or were blown up by buried mines, and the Japanese machine guns, which took positions to support the advance, were silenced for a time and beaten back. The Japanese, however, recovering, pressed on with greater resolution, and the Russians finally yielded the hill in face of greatly superior numbers and a determined series of attacks which continued night and day.

Some of the leading features of the battle after the capture of Beresneff Hill, occurring on the three successive days, beginning February 27, were the hard fighting on the eastern flanks of the armies, a part of Kuroki's troops crossing the Shakhe River, a general battle going on along the whole one hundred miles of front occupied by the two

armies, and Kuropatkin's reply to General Kuroki's attack on the Russian left by a counter attack on the Japanese left. Up to March 2nd, the Japanese continued the attack against the Russian positions on the Shakhe, and on that day drove in both flanks and advanced on Lone Tree (Putiloff) Hill. The next day both wings of the Russian army crumpled toward Mukden; the Japanese pressed hard on the center, and Kuropatkin began to withdraw toward Tie-Ling, having already removed a large part of his stores from Mukden. The next day another step toward final victory was made by the Japanese breaking the left wing of the Russian forces, crumpling up their right and encircling them. This envelopment movement was a pronounced success, and on March 6 there was an attack along the entire Japanese line, and the battle raged in a great arc around Mukden. On the 8th of March Kuropatkin had abandoned his positions south of Mukden, and the Japanese were attacking the city from all sides. The next day fighting continued north and northwest of Mukden, and on March 10, Mukden fell into the hands of the Japanese.

Oyama reported that the Japanese enveloping movement had been entirely successful and that along with Mukden, Fu-Shun and immense quantities of stores, guns and ammunition were captured. The capture of Mukden virtually ended the great battle that had raged for full fifteen days, not counting the numerous attacks and repulses and bombardments for days preceding the general engagement.

The battle of Mukden may be set down as the greatest of the world's history in the number of men engaged, the extent of the battle line and the long duration of the fighting, and it may justly be rated, too, as one of the greatest in the importance of the issues at stake. Some writers compare it in rank and decisiveness with Waterloo, Austerlitz and Gravelotte. The Japanese attack had been pushed with a determination and a disregard for suffering and death that gave it a distinction even in this remarkable war. It was said of General Nogi's veterans, who won special honors in the engagement, that when they charged the center, they shouted in Russian: "Out of our way! We are from Port Arthur!" The victory over the Russians, who held out with all the traditional tenacity characterizing their career, is another compliment to the superb generalship of Oyama and his invincible army. The whole number of men engaged in the battle were in round numbers, Japanese, 500,000, and Russians, 325,000.

The Russian losses, officially reported for the battle, were 107,000 men. Japan's losses were about 42,000. The Russian prisoners Japan held at this time, including the captives taken at this battle, numbered 95,000.

The next day after the engagement, March 11, the Japanese continued a vigorous pursuit of the Russians. The former advanced north from the vicinity of the Pu River and, immediately after their departure, engaged with a large column of the latter retreating north. After a hand-to-hand battle, the Japanese captured the column. On the same day Kuropatkin reported that his retreat on Tie Pass had progressed so favorably as to put his armies out of danger, but that the Japanese were still hanging on his flanks and a continuous rear-guard action was being fought. Following up the retreating forces, Marshal Oyama planned to capture the entire Russian army, but Kuropatkin, exercising his usual strategic skill in tactical retreats, succeeded in eluding his wily foe. By March 20, the retreating Russian army had reached a point 27 miles north of Tie Pass, with the Japanese still in pursuit but not near enough to harass them.

On March 17, the Czar recalled Kuropatkin and put General Linevitch in his place as commander-in-chief of the Russian forces. General Kuropatkin then magnanimously volunteered his services in the field and was given command of the First Russian Army.

From March 21 to the end of the month, the Russians continued their retreat leisurely, progress of their march being considerably impeded by the ground thawing, making it difficult to move guns and transport wagons. During the month of April, active hostilities were but little in evidence. General Linevitch established headquarters in Harbin, concentrated some of his forces at Chang-Chun for the defense of Harbin, sent a detachment of 5,000 to guard Kirin, and entrenched a large army at Swantsanhei. Oyama moved a part of his armies against Vladivostok on the east and another detachment to Tsitsihar on the west. His activities in Manchuria, eastward of Harbin, toward the latter part of the month, gave rise to the belief that he was about to resume the offensive.

The Baltic Fleet.

There was a long cessation of naval engagements after the series of battles, on water, during the first half year of the war. During the interval of peace on sea, interest was centered in the next step Russia was taking to regain her lost prestige. In view of the non-effectiveness of her Pacific fleet, she hastened preparations to send the most formidable vessels of her Baltic fleet to the Pacific. Early in September, 1904, arrangements were made for the fleet to start from Kronstadt and, on the 11th of the month, it sailed out of port, but stopped at Reval, where it remained for a few weeks.

This Russian Baltic fleet, ordered to the Far East, consisted of three divisions. The first division under Admiral Rojestvensky, included the battleships *Sissoi*, *Veliky* and *Navarin*, the cruisers *Junstchug* and *Almaz*, six destroyers and eight transports. In the second division were the cruisers *Oleg*, *Izumrud*, *Kuban* and *Terek*, and the auxiliary cruisers *St. Petersburg* and *Smolensk*, which were renamed *Run* and *Dneiper*, with five destroyers. The third division was composed of the battleships *Kniaz*, *Suvaroff*,

Borodino, *Imperator Alexander III*, *Orel* and *Osliabia;* the cruisers *Admiral Nakhimoff*, *Dmitri Donskoi*, *Aurora* and *Svietlana*. The squadron as a whole was composed of so many different types that it lacked that homogeneity which tacticians of the modern school consider to be of prime importance to the effectiveness of a fleet. As an offset to this defect, it contained among its vessels four battleships which were considered, in some respects, the best in the world. They were the *Borodino*, *Orel*, *Imperator Alexander III*, and *Suvaroff*. Each carried four 12-inch and twelve 6-inch guns, besides a numerous battery of smaller rapid-fire pieces. The heavy guns were protected by 11 and 10 inches of armor, and the six turrets containing the twelve 6-inch guns in pairs, carried six inches of armor. Theoretically, these ships are unsinkable by gun fire at ordinary battle ranges.

The length of the journey undertaken by the Baltic fleet equals more than half the distance around the globe, being 12,270 nautical miles and 14,110 statute miles by the shortest possible route on water from Kronstadt in Finland Gulf to Port Arthur in the Yellow Sea. The general course taken was from Baltic Sea to North Sea, south to Strait of Gibraltar, across Mediterranean Sea, through Suez Canal to Red Sea, then Arabian Sea, Indian Ocean, Pacific Ocean, and Yellow Sea. The longer voyage, taken by a part of the fleet, was by way of Cape of Good Hope.

It was the 10th of October before the Russian Armada finally set out from Reval to Libau, from which point it was to start on its voyage to the Far East. After some more delays it at last steamed away and reached Skagen, Denmark, where it dropped anchor for a short stop, on October 20. The next day at midnight the squadron under Vice Admiral Rojestvensky, in passing through the North Sea, about 200 miles from the English coast, came within sight of some British steam fishing vessels, and mistaking the steam trawlers, as they afterwards alleged, for Japanese torpedo boats, the Russians opened fire upon them, and continued the bombardment for twenty minutes, during which time they sank the fisher *Crane*, badly injured the *Gull*, killed two men, and wounded a few others. After this incidental exploit, the squadron resumed its course southward. In compliance with the decision of an international commission, Russia paid England £65,000 as an indemnity for the offense.

Further progress of the voyage, until reaching Eastern waters, was without particular incident. It was well on in April before the fleet under command of Vice Admiral Rojestvensky in the China Sea, assumed an aggressive attitude. Following this period, up to the latter part of May, but little was known of Admiral Togo's movements or of Vice Admiral Rojestvensky's plans. On the morning of May 27, it was reported that the entire fighting strength of the Russian Baltic fleet was seen in the vicinity of Tsushima in the Korean Straits. It was on the Saturday afternoon of this date, May 27, 1905, that the two great ocean giants of Japan and Russia joined in the final struggle for national supremacy in the Battle of the Sea of Japan.

The Naval Battle of the Sea of Japan.

Between 5 and 6 o'clock in the morning of that eventful day, May 27, 1905, Admiral Togo's scouts discovered the Russian fleet, in two columns, near Quelpart Island, steaming northeast apparently toward Tsushima (Tsu Island), which divides the Korean Strait into the eastern and western channels. This information was at once sent to the admiral's flagship, the *Mikasa*, on which, with his fleet close at hand, he had, as it afterward became clear, been harboring near Masampo, on the southeastern coast of Korea and on the western waters of Korean Strait. On receiving word of the enemy's approach, he moved eastward across the northerly end of Tsushima. Here he awaited further information and, about midday, learning that the Russians were coming up the eastern channel, which lies between Tsushima and the Japan coast and is about thirty miles wide, he deployed his fleet partly across the mouth of this channel, between Tsushima and Ikishima, but sheering to the west so as to assume a parallel position with the Russians.

The Russians advanced into action in double column, their eight battleships, under the immediate command of Admiral Rojestvensky himself, on the side toward Japan, and their six cruisers on the left. In the rear were the coast-defense ship and destroyers with the transports and colliers in the center. The whole fleet was said to consist of thirty-six vessels as follows: eight battleships, three coast-defense ships, three armored cruisers, six protected cruisers, twelve torpedo boat destroyers, two hospital ships, a repair ship and a tank vessel.

The Japanese fleet was reported as consisting of four first-class battleships, one coast-defense vessel, eight armored cruisers, eleven protected cruisers, four scout cruisers, from twenty to twenty-five destroyers, about forty torpedo boats, six submarines and from twenty to thirty auxiliaries. Not counting the battleships on each side, the war craft of the Japanese far exceeded that of the Russians in variety and number.

Admiral Togo, with his vessels in systematic order, moved south in the channel, while Admiral Rojestvensky steamed steadily ahead until the fleets came within firing distance of each other at 2:13 P. M., when Rojestvensky's flagship, the *Kniaz Suvaroff*, at the head of the Russian line, opened fire, and Togo replied from the *Mikasa*, and soon the firing became general all along the line, fifty miles in extent. After the battle had fairly begun, Admiral Kataoka attacked the Russians from the front with a light cruiser squadron, then Admiral Kamimura, with the rest of the cruisers having let the Russians pass, swung upon them from the south. With remarkable unity of action among the various Japanese squadrons, seemingly as perfect in design and movement as clock work, Admirals Dewa and Uriu, from their

positions near Ikishuma, attacked them from the north, while the battleship squadron maneuvered by Admiral Togo opened a deadly fire upon the discomfited Baltic fleet from the west, pressing the battle-racked vessels towards the rough coast lines of Japan. Admiral Togo arranged his fleet for a long-range running fight, the naval tactics he had previously employed with signal success. As the fighting continued, the Japanese gradually enveloped the Russians on the north, west and south, and from the three sides a terrific bombardment broke upon the doomed fleet while the rocky shore on the fourth made safety in flight impossible. The fire of the Japanese was concentrated upon one Russian vessel after another with destructive force until, in turn, nearly every Russian ship went down or was captured. Aside from their superior marksmanship, the Japanese were favored by their position in the sea, being on the windward side and with the sun at their backs, while the Russians had the sun in their faces and fired against the wind from a rough sea, all of which contributed to render their resistance ineffectual. In two hours' time the telling blows from the Japanese had crippled and disorganized the Russian fleet. Their flagship, the *Kniaz Suvaroff*, settled by the head and finally sank, also the splendid battleships *Sissoi Veliky* and *Borodino* were sunk. The latter had her forward turret wrecked, her ammunition hoists shot away, 400 of her crew disabled and after being repeatedly hulled, received her death wound in the evening from the torpedo-boat flotilla. The *Osliabia*, *Navarin* and *Alexander III.* were destroyed and sunk. The Japanese kept up an incessant pursuit and under the pall of night their torpedo divisions dashed in upon the huddled and disorganized Russians and sank the coast-defense ship *Admiral Oushakoff*, the armored cruiser *Dmitri Donskoi* and the protected cruiser *Svietlana*. The battle and pursuit was renewed Sunday morning, the 28th, and the battleships *Nicholas I.* and *Orel* were captured, and soon after the *Admiral Seniavin* and the *Admiral Apraxine*, coast-defense vessels, shared a similar fate. *Vladimir Monomakh* and *Admiral Nakhimoff* which had been disabled by gun fire on Saturday were sunk near Tsushima by torpedoes on Sunday. Admiral Rojestvensky, when he saw his flagship doomed to succumb under Japanese fire, transferred his command from the *Kniaz Suvaroff* to the *Borodino*, where he was wounded, and from the latter was taken aboard the *Biedovy*, a destroyer, in whose hold he was found, wounded and bleeding, when she was captured by the Japanese near the Korean coast. Admiral Voelkersahm, in command of the Russian battleship squadron, was killed at the beginning of the fight in the conning tower of his flagship, the *Osliabia*. Admiral Nebogatoff, with his coast defenders and the battleships *Orel* and *Nikolai I.*, made a dash to the north but was overtaken by the Japanese, Sunday morning, off the Liancourt Islands, nearly two hundred miles north of Tsushima. One of his ships, the *Izumrud*, escaped, but ran on a reef the following Monday night, and her commander, Ferzen, landed his crew and blew her up. Nebogatoff surrendered, with *Nikolai I.*, the battleship *Orel* and the coast defenders *Seniavin* and *Apraxine*, to the Japanese under Uriu and the younger Togo. Admiral Enquist, who had command of the heavy cruiser division, made his escape and steamed south arriving at Manila, June 3, with his three cruisers, the *Aurora*, the *Jemchug*, and the *Oleg*. The cruiser *Almaz* and three destroyers eluded the vigilance of the Japanese and sought harborage at Vladivostok. Another Russian destroyer found its way into Shanghai harbor, June 4. The wreck of Russian vessels and the bodies of Russian sailors were strewn along the shores of Japan for three days. The pursuit and attacks of the Japanese upon the flying remnants of the squadrons were kept up continuously over Sunday and all through the night until late in Monday morning, the 29th, when Admiral Togo sent his message to the Mikado announcing the practical annihilation of the great Baltic fleet. The victory of the Japanese was decisive, complete, and gave them absolute mastery over their foes.

The Russian loss, aside from many minor casualties, included six battleships, three armored cruisers, one coast-defense vessel, two protected cruisers, six destroyers, and two special-service ships, one of which was the highly valued repair ship *Kamschatka*. Among the captures were the *Orel* and *Nikolai I.*, one destroyer and two coast-defense vessels. As to the Japanese their only vessels lost were three torpedo-boat destroyers. Their battleships and cruisers suffered no serious damage.

The disparity in the loss of vessels between the two naval fleets was no greater than that of the other casualties. The Russian loss of life was estimated at 7,000 and from 3,000 to 4,000 prisoners. The Japanese loss was authentically reported as 113 officers and men killed and 424 officers and men wounded.

Peace Negotiations.

After the great sea battle, the time seemed opportune to propose peace negotiations and stop the appalling destruction of human life. Enough had been done to test the comparative skill and strength of the contending forces; yet, Russia, relying upon her power of endurance and vastness of resources, was in no mood of mind to propose a cessation of strife that might carry with it an implication of total subjugation, while Japan was not inclined to make the proposition without positive assurance of its acceptance in a manner creditable to her motives and in recognition of the prestige she had gained in the war. Upon the opposite brinks of this dark chasm, the two belligerent Powers stood, each doubtfully awaiting the other to hazard the first step toward crossing. It soon became evident that from the attitudes each assumed that any proposition for peace negotiations from either side was hopeless and the only other alternative to a continuance of the war was the mediation of

some influential third Power, free from all kinds of entanglements or alliances on either side, to bring them together for consultation. The United States of America was the one nation capable of performing this service for humanity and President Roosevelt with commendable diplomacy, placed himself in communication with the governments of Japan and Russia and urged them, through their representatives, to open direct negotiations for peace. The President's note, which was identical in text to both nations, was presented to the Mikado, in Tokio, June 7, and on the same date was read to the Czar by Ambassador Meyer. Favorable responses having been received from both countries and the information, together with other correspondence, having been interchanged through the President, the next stage of the proceedings was settlement upon place of meeting. Japan refused to consider any locality in Europe and Russia objected to any place in the Far East, but the United States meeting with favor by both sides, Washington was chosen as the place for the conference. To avoid the excessive heat of August weather in the capital city, the location finally settled upon was Portsmouth, on the coast of New Hampshire. The peace plenipotentiaries, Count Sergius Witte and Baron Rosen, representing Russia, and Baron Komura and Minister Takahira, representing Japan, met at Portsmouth, August 9, 1905, and remained in session until the 29th of the same month when negotiations were concluded by agreement on terms of peace.

The terms agreed upon by Russia and Japan provided for the recognition of Japan's preponderating influence in Korea, but Japan to observe its territorial integrity and preserve the "open door" policy. Mutual obligations were signed to evacuate Manchuria, to restore Chinese sovereignty, and for the "open door" principle. Russia surrendered to Japan its Liaotung leases, including Port Arthur and Dalny. Railway from Quanchontze to Port Arthur and Newchwang was surrendered to China, with limitation of the privileges obtained in 1896 by Mr. Rothstein and Prince Uhktomsky. Agreement was made to divide Sakhalin on the 50th degree of north latitude, Russia to have the northern part and Japan the southern half, with fishing rights on the Siberian coast. The demands withdrawn by Japan were remuneration for cost of war (indemnity), surrender to Japan of interned war ships, the limiting of Russia's naval power in the East, and Japan's claim on northern half of Sakhalin Islands.

The terms of peace having been agreed upon, the conferees adjourned to meet again for the signing of the treaty. This final meeting was held September 5, 1905, and ended the labors of the Portsmouth Conference. The armistice which had been agreed upon several days before was given immediate effect and the plenipotentiaries took their departure from Portsmouth.

The treaty, as finally executed, demanded less of Russia, and more from Japan than public sentiment conceded to be just to the victor. Yet, while it might be contended that Japan was too gracious to Russia for the latter's deserts and too self-sacrificing to be just to her own people, time will doubtless vindicate the wisdom of her act and accord her high honor for rising to the occasion with such superb magnanimity and waiving her claim to an award — indemnity and territory which all the world deemed her justified in claiming — for the sake of peace; peace with an enemy she had vanquished in every important contest and whom she then held in her power and felt confident she could conquer and humiliate to the bitter end. The moral victory thus involved in Japan's concession for peace became the crowning laurel of her triumphs in war.

From the date of Japan's recall of her representatives at the court of St. Petersburg, February 6, 1904, to the conclusion of peace at Portsmouth, September 5, 1905, hostilities extended over a period of 578 days. Of more than a dozen hard-fought engagements, the siege of Port Arthur, and the battles of Liaoyang, Mukden and Sea of Japan will rank among the most memorable conflicts recorded on the pages of history. The estimated number of men sent by Russia to the front was 840,000 and that of Japan, 700,000. Supposedly authentic reports gave the total of Russians killed and wounded as 192,000, and of the Japanese, 154,000. Russians taken prisoners, 67,700; Japanese taken prisoners, 646. Russian ships lost, 49; Japanese ships lost, 10. Cost of war to Russia, $1,042,500,000; cost of war to Japan, $613,050,000. Japan won every important battle on land and sea during the war.

RUSSO-TURKISH WAR. See TURKEY, Vol. XXIII, pp. 692, 693.

RUSTAM. See PERSIA, Vol. XVIII, p. 570.

RUSTS, a common name given to various parasitic fungi, notably those of the order *Uredineæ*, which give a rusty appearance to the plants which they infest. Probably the best known is the wheat-rust, whose life-history is very complex. In different phases of its life-history it lives upon different hosts, or none at all. Normally appearing upon the leaves of the barberry, it produces spores, which germinate later in connection with wheat, producing the common red rust; while later, on the wheat (upon the stubble if the wheat is cut), there appear other spores, known as the black rust. The black rust spores give rise to still another phase of the plant, which does not live parasitically, and the spores of this, in turn, give rise to the form on the barberry. There are numerous forms of rusts infesting many plants, all with a more or less complex life-cycle.

RUTABAGA, the name given to a variety of turnip, otherwise known as the Swedish turnip, which differs from the ordinary form in having longer and yellowish roots. All the forms of turnip seem to have been derived from *Brassica campestris* of the Old World, a genus which also contains the mustards and cabbages.

RUTACÆ, a natural order of shrubs or trees, scattered over the temperate and warmer regions of the globe. Citrus is the most celebrated genus,

on account of its fruits (orange, lemon, lime, etc.). A volatile oil is obtained by distillation from the the flowers and epicarp, which, dissolved in alcohol, produce eau de cologne. W.R.B.

RUTGERS, HENRY, patriot and philanthropist; was born in New York city, on October 7, 1745, and was graduated from King's (now Columbia) College in 1766. He was an officer in the American army in the Revolution, served in the New York legislature for many years after 1784, and gave much real estate to the city for public purposes. He was a regent of the University of the State of New York from 1802 to 1826, and gave $5,000 to Queen's College, New Jersey, the name of which was changed to Rutgers. He died on February 17, 1830. W.F.J.

RUTGERS COLLEGE, an institution at New Brunswick, New Jersey, chartered in 1766 as Queen's

MAIN BUILDING, RUTGERS COLLEGE.

College, primarily for the education of candidates for the ministry of the Reformed Dutch Church, of which, by the charter, the president is required to be a communicant. The early history of the college was marked by constant struggles, and for a time its exercises were suspended, but in 1825, after receiving a benefaction from Henry Rutgers of New York, it was reopened under its present name. In 1863 a scientific department, under the name of Rutgers Scientific School, was organized. In 1904, there were 35 instructors, 260 students, and 51,000 volumes in the library.

RUTHERFORD, New Jersey, a borough of Bergen County, seven miles by steam and electric trolley lines north of Jersey City. It is a picturesque residential resort on the hills between the Hackensack and Passaic rivers, and has some factories. Population, 1900, 4,411. C.L.S.

RUTHERFORD COLLEGE, the seat of Rutherford College, in northwestern North Carolina. It is a co-educational, non-sectarian institution, organized in 1853, and having, in 1900, 9 instructors, 150 students, and a library containing 6,000 volumes.

RUTHERFORDTON, a village and the capital of Rutherford County, western North Carolina, 30 miles S.S.W. of Morgantown, on the Ohio River, and on the Charleston and the Seaboard Air Line railroads; has large factories of leather and harness, four churches and a courthouse. Population 1900, 880.

RUTHERFURD, LEWIS MORRIS, astronomer, was born at Morrisania, N. Y., on November 25, 1816, a great-nephew of Lord Stirling and a descendant of Lewis Morris. He was graduated from Williams College in 1834, studied law with William H. Seward, and was associated in practice with John Jay and Hamilton Fish. He left the bar, however, for astronomical studies, and particularly for astronomical photography. To this end he built in New York what was then the finest and most completely equipped private observatory in America, made an equatorial telescope, and invented a device for using it for photographic purposes. He invented also an apparatus for measuring the position, angle and distance from a central star of any star shown on a photographic plate, an object glass for photographing by means of chemical rather than visual rays, and a device for adapting an ordinary lens for photographic use. In his work he had at first little encouragement from other astronomers, but he was really the founder of that photographic astronomy which is now recognized to be of prime importance. In 1865 he placed some of the results of his labors in the hands of Professor Gould, who laid them before the National Academy of Sciences, and their value and significance were soon recognized by that body. To such labors Mr. Rutherfurd devoted most of his life. When his health failed he gave his instruments and collections of stellar photographs to Columbia College, of which he was a trustee. He died on May 30, 1892. W.F.J.

RUTILE. See TITANIUM, Vol. XXIII, p. 437.

RÜTIMEYER, LUDWIG, a Swiss naturalist; born at Biglen, Feb. 26, 1825; became an academic teacher at Berlin in 1854, and, in 1855, professor of zoölogy and comparative anatomy at Basel, where he died, Nov. 26, 1895. He wrote *Eocäne Säugetiere aus dem Gebiet des Schweizer Jura* (1862); *Ueber die Herkunft unserer Tierwelt* (1862); *Beiträge zur Natürlichen Geschichte der Wiederkäuer* (1865); *Die Grenzen der Tierwelt* (1868); *Ueber Thal- und Seebildung* (1869); *Ueber Pliocän und Eisperiode auf Beiden Seiten der Alpen* (1875); *Der Rigi* (1875); *Ueber die Art des Fortschritts in den Organischen Geschöpfen* (1876); *Studien zur Geschichte der Hirsch-Familie* (1882); *Die Bretagne* (1882); *Ueber einige Beziehungen Zwischen den Säugetieren Alter und Neuer Welt* (1888). G.A.S.

RUTLAND, a city of Vermont. The railroads entering the city are the Central Vermont, the Bennington and Rutland and the Delaware and Hudson. The city has a fine water-supply, gas and electric light plants, a number of fine churches, and public schools, a classical institute, military institute, several libraries, and convents, a United States

government building, one of the state penitentiaries, a house of correction, 5 national and 2 savings banks, and 2 trust companies. There are manufactories of dairy and cheese factory apparatus, machinery, sugar-evaporators, shirts, scales, sewer-pipe, engines and boilers, doors, sashes and blinds, monumental and cemetery work, and onyx decorative works. Population 1899, 11,760; 1900, 11,499. See also RUTLAND, Vol. XXI, p. 123.

RUTLAND (JOHN JAMES ROBERT MANNERS,) DUKE OF, (the seventh of the title), born at Belvoir Castle, Leicestershire, Dec. 13, 1818; educated at Eton, and Trinity College, Cambridge; was returned as a Conservative member of Parliament from Newark in 1841; was defeated in a contest for Liverpool in 1847, and for London in 1849, but was returned for Colchester in 1850, and represented that borough until 1857, when he was elected for North Leicestershire. While in Parliament he opposed the repeal of the Corn Laws; advocated cultivation of diplomatic relations with the Pope, a relaxation of the law of mortmain, the passing of the Ten Hours Factory Act; opposed Sir Robert Peel's free import measure in 1845–46, and from that time identified himself completely with the Conservatives; was First Commissioner of the Office of Works in all three of Lord Derby's cabinets; on the return of the Conservatives to power in 1874, was appointed Postmaster-General, holding the office until the Conservatives went out of power in 1880; was returned to Parliament for the Melton division of Leicestershire, 1885, when he resumed his former position in the conservative administration, and next year was appointed chancellor of the Duchy of Lancashire. He succeeded his brother in the peerage, March 2, 1888. *Revised by* R.C.A.

RUTLEDGE, EDWARD, an American public man; born in Charleston, S. C., Nov. 23, 1749. He received a liberal education; studied law at the Temple in London; and began practice in Charleston in 1773. He was a delegate from South Carolina to the Continental Congress, 1774–77; was appointed a member of the first board of war in June, 1776; later became captain of a company of volunteer infantry in the Revolutionary army; was taken prisoner when the British captured Charleston, and imprisoned at St. Augustine for a year; was later exchanged; and was governor of South Carolina from 1798 until Jan. 23, 1800, when he died at Charleston. E.E.T.

RUTLEDGE, JOHN, an American jurist; born in Charleston, S. C., in 1739. After studying law in London he began the practice of law in Charleston in 1761. He was a delegate to the Provincial Congress in 1765, and to the Continental Congress, 1774–77 and 1782–83; was president of South Carolina, 1776–78, and governor, 1779–82; State chancellor, 1784; member of the State Convention to ratify the Federal Constitution; received the Electoral vote of South Carolina for Vice-President in 1789; and was associate justice of the United States Supreme Court, 1789–91. He was elected chief justice of South Carolina in 1790, and resigned in 1795, in which year he was nominated for chief justice of the United States Supreme Court, but on account of his mental failing the Senate refused to confirm the nomination. He died in Charleston, S. C., July 23, 1800. E.E.T.

RUTULI. See ÆNEAS, Vol. I, p. 165; and also LATIUM, Vol. XIV, pp. 344, 345.

RUVO DI PUGLIA, Italy, a city in the province of Bari, Apulia, 20 miles west of Bari. It has an interesting 12th century cathedral, and is a trading center. Population, 23,373. C.L.S.

RYAN, ABRAM JOSEPH, clergyman and poet, best known as "Father Ryan," was born of Irish parentage at Norfolk, Va., on August 15, 1839, and was educated for the Roman Catholic priesthood. An ardent Confederate, he entered the Southern army in the Civil War as a chaplain, and also served as chaplain of a plague-stricken prison in New Orleans. After the war he was at Biloxi, Miss., at Knoxville, Tenn., at Augusta, Ga., where he edited *The Banner of the South*, and at Mobile, Ala., where he was some years pastor of a church. Finally he went to the Franciscan monastery of St. Boniface, at Louisville, Ky., and died there on April 22, 1886. He is chiefly remembered as the author of some stirring Southern war songs, and as perhaps the best poet the Confederate cause inspired. His best poem of that class is *The Conquered Banner*, written on Lee's surrender. W.F.J.

RYAN, PATRICK JOHN, an American prelate; born in Thurles, Ireland, Feb. 20, 1831. He graduated at Carlow College in 1852; was ordained sub-deacon in the Roman Catholic Church; and shortly after came to the United States. He became professor of English literature at Carondelet Theological Seminary, St. Louis; was ordained deacon there, and priest in 1853; and served at the cathedral, where he became rector in 1856. During the Civil war he acted as chaplain of the Gratiot Street Military Prison and Hospital, St. Louis; and while rector of Annunciation Church delivered Lenten lectures in English at Rome in 1868, on invitation of Pope Pius IX. In 1872 he was consecrated titular bishop of Tricomia in Palestine *in partibus infidelium*, and made coadjutor bishop of St. Louis; was promoted to archbishop in 1883, and transferred to the see of Philadelphia, June 8, 1884. He has written *What Catholics Do Not Believe; The Causes of Modern Religious Skepticism;* etc. E.E.T.

ARCHBISHOP RYAN.

RYDBERG, ABRAHAM VICTOR, a Swedish author; born in Jönköping, Smaland, Dec. 18, 1829; educated at Vexio and the University of Lund. He became literary editor of a daily paper at Gothenburg in 1855. In 1870 he was elected to the Swedish Parliament from Gothenburg; in 1876 inaugu-

rated the annual philosophical and historical conferences; in 1877 was elected to the Swedish Academy, and in 1882 was named professor of the history of civilization by the New Academy of Stockholm. Rydberg published a number of romances, which have been translated into English, as *The Freebooter of the Baltic; The Last Athenian; Adventures of Little Vigg; Roman Legends;* etc. He also published several extremely rationalistic works on religious and Bible subjects, as *Doctrine of the Bible on Christ; Jehovah Worship among the Hebrews; Pre-existence of Man*, and *Eschatology* (1880). His *Poems* were published (1882), his investigation in *German Mythology* (1886). Died Sept., 1895.

RYDQVIST, JOHAN ERIK (1800–78), a Swedish philologist. See SCANDINAVIAN LANGUAGES, Vol. XXI, p. 388.

RYE, the common name of species of *Secale*, a genus of grasses allied to wheat and barley. One species (*S. cereale*) is a well-known grain. It has, when in fruit, a roundish-quadrangular spike, with a tough rachis. Its cultivation does not extend so far north as that of barley, but it grows in regions too cold for wheat and on soils too poor and sandy for any other grain. Its ripening also can be more confidently reckoned upon in cold regions than that of any other grain. But rye succeeds best, and is most productive, in a climate where wheat ripens. It is extensively cultivated in the Middle Atlantic and Northeastern states, in Ohio and Michigan and other Western states. Rye grows best on a rich sandy loam; but it will flourish on light soils not adapted to other white crops. The soil should be prepared for rye in the same manner as for wheat. There is but one species of rye used as grain, but this is divided into two varieties, known as spring and winter rye. Winter rye is sown late in August or early in September, from one to two bushels of seed per acre being used, according to the quality of the soil. Except for harrowing and rolling in the spring, no after-cultivation is necessary.

RYE-GRASS. See AGRICULTURE, Vol. I, p. 333.

RYE HOUSE PLOT, in English history, an alleged conspiracy organized in 1683 at the Rye House, Hertfordshire, to assassinate Charles II and his brother, the Duke of York, in the interests of a Protestant succession. See also MONMOUTH, Vol. XVI, p. 783.

RYE IN THE UNITED STATES. See AGRICULTURE, in these Supplements. In 1900, the acreage in rye in all the States of the Union was 2,054,292 acres, with a total production of about 25,568,600 bushels, valued at $12,300,000. The average yield to the acre was 15.1 bushels, or in value about 51c to the bushel.

RYLE, JOHN CHARLES, an English bishop; born in Macclesfield, May 10, 1816; educated at Eton and Christ Church, Oxford, and ordained in the English Church in 1841, when he became curate of Exbury. In 1844 he was made rector of Helmingham, and in 1861 he became vicar of Stradbroke. He soon became widely known as the writer of pithy, forcible tracts of decided evangelical sentiment. In 1880 Lord Beaconsfield called him to be bishop of the newly created diocese of Liverpool. Ryle published *Expository Thoughts on the Gospels* (6 vols.); *Plain Speaking; Christian Leaders a Hundred Years Ago; Bishops and Clergy of Other Days* (1869); and *Church Reform Papers* (1870); and a large number of tracts, many of which have been reprinted in French, German, Dutch, Italian, Russian, Hindustani and Chinese. He died June 10, 1900.

SAALE RIVER—SACHAU

SAALE RIVER. See ELBE, Vol. VII, p. 717.

SAARDAM. Same as ZAANDAM. See Vol. XXIV, p. 799.

SABA, a small island of the Lesser Antilles, in the West Indies. It is high and rocky; the inhabitants are of Scotch descent, but the island belongs to the Dutch. It is a dependency of Curaçao. Area, 5 sq. miles; population 1900, 2,779.

SABADELL, Spain, a manufacturing town in the province of Barcelona, 12 miles by rail north of Barcelona, on the Llobregat. Its industrial importance is of ancient date, it having long been noted for its production and export of paper, woolens, cottons, muslins, and other textiles. Population, 22,908. C.L.S.

SABADILLA OR CEBADILLA. See VERATRUM, Vol. XXIV, p. 177.

SABÆANS. See YEMEN, Vol. XXIV, pp. 775–778.

SABAKA OR SHABAK, a conqueror of EGYPT. See EGYPT, Vol. VII, p. 643.

SABANILLA, Colombia, a town and harbor of the department of Bolivar, on the Caribbean Sea, 10 miles by rail west of Barranquilla, at the mouth of the Magdalena, of which it is the seaport, with a large trade. Pop., 2,000. C.L.S.

SABATIER, PAUL, a French evangelist; born Aug. 3, 1858, at St. Michel de Chabrillanoux, Cevennes. After studying theology in Paris from 1880 to 1885, he preached at Strasburg until 1889, when, to escape compulsory German naturalization, he retired to St. Cierge-la-Serre, in the Cevennes, and carried on evangelization among the peasants. In addition to a number of sermons, he published a *Life of St. Francis of Assisi*, an English translation of which appeared in 1894.

SABBATHAI LEWI OR ZEBI. See JEWS, Vol. XIII, p. 691.

SABBATICAL YEAR. See SABBATH, Vol. XXI, p. 135.

SABELLIAN DIALECT. See ROMANCE LANGUAGES, Vol. XX, p. 678.

SABINE RIVER AND PASS. The river rises in Hunt County, Texas, and flows southeast to the western boundary of Louisiana, thence southward, forming the boundary between Texas and Louisiana, until it enters the Gulf of Mexico through SABINE PASS, which is the mouth of Sabine River. The pass has a muddy bar with shoal water and a narrow channel; dredging has been undertaken to improve it. There is a brick lighthouse on Brand Point with a flashing dioptric light of the third order. The Southern Pacific railroad passes here.

SABISM. See SABIANS, Vol. XXI, p. 136.

SABLE. See MARTEN, Vol. XV, p. 584.

SABLE, CAPE, the most southern point of the peninsula of Florida, lat. 25° 6′ N., long. 81° 9′ W. The site of Fort Poinsett.

SABLE, CAPE, Nova Scotia, the southernmost point of the province, on Cape Sable Island, to which it gives its name, derived from the French *sable*-sand. The island is administratively attached to Shelburne County and is occupied chiefly by fishermen. Population, 1901, 2,150. C.L.S.

SACALINE. See POLYGONUM, in these Supplements.

SACCHARINE. See CHEMISTRY, in these Supplements.

SACCHAROMETER. See BREWING, Vol. IV, p. 237.

SACCHAROMYCES. See FERMENTATION, Vol. IX, p. 84.

SAC CITY, a city and the capital of Sac County, central northwestern Iowa, 42 miles W. of Fort Dodge, on the Chicago and North-Western railroad, and on the north fork of the Racoon River. It is in a dairying and stock-raising district, and has a flour-mill, foundries, a machine-shop and a lightning-rod factory. Population 1890, 1,249; 1900, 2,079.

SACCOMYIDÆ, a family of small rodents which resemble mice. Many species have long, kangaroo-like hind limbs and a long tail. They are remarkable for their large cheek-pouches, formed by an infolding of the skin of the head. This characteristic has given the popular name pocket-mice. The members of the genus *Dipodornys* are sometimes called kangaroo-rats (q.v., in these Supplements). The *Saccomyidæ* are inhabitants of western North America.

SACCOPHERYNGIDÆ, a family composed of several species of deep-sea fishes, which are believed to have affinities with the eels. Like many other deep-sea fishes, the body is very soft and delicate, and in consequence their anatomy is not well known. They have many peculiarities which are of interest to anatomists. These fishes have been classed in an order called *Lyomeri*, which name, signifying looseness, refers to the many anatomical features which are anomalous among fishes.

SACCULINA. See CRUSTACEA, Vol. VI, p. 572.

SACHAU, EDUARD, a German Orientalist; born at Neumünster, July 20, 1845. After having studied classical and Oriental languages, he became, in 1872, ordinary professor of Semitic languages at Vienna, and, in 1876, professor of Oriental languages at Berlin, and director, and, in 1898, president of the Oriental Seminary, member of the academy, and, in 1900, of the council for German Colonies. Among his works are *Reise in Syrien und Mesopotamien* (1883); *Altaramäische Innschrift auf der Statue des Königs Panammu von 'Sam-al* (1893); *Katalog der*

Persischen Handschriften der Bodleyana (1889); *Verzeichniss der Syrischen Handschriften; Am Euphrat und Tigris.* G.A.S.

SACHER-MASOCH, Leopold von, an Austrian author; born in Lemberg, Galicia, Jan. 27, 1835; studied at Prague and Gratz and was for a time teacher at the latter university, but soon gave himself up entirely to literature. With M. R. Armand he founded a review, which displayed sympathy for France, entitled *Auf der Höhe*, and in January, 1883, was made a chevalier of the Legion of Honor. Besides two historical works, *Der Aufstand in Gent unter König Karl V* (1857) and *Ungarns Untergang und Maria von Oesterreich* (1861), he published numerous novels, the best known of them being the series known as *Cain's Inheritance.* Died in Lindheim, Hesse, March 9, 1895.

SACHS, Bernhard, physician; was born in Baltimore, Maryland, in 1858, and studied at Harvard, Berlin, Vienna, and London, and was graduated in medicine from the University of Strasburg in 1882. He has since been settled in professional practice in New York city, paying especial attention to nervous and mental diseases. He is the author of *Mental and Nervous Diseases of Children*, and other works. W.F.J.

SACHS, Julius, a German plant-physiologist; born at Breslau, Oct. 2, 1832, studied at Prague; became, in 1861, professor at the Academy of Agriculture of Poppelsdorf; in 1867, professor of botany at Freiburg, and, in 1868, at Würzburg, where he died, May 29, 1897. His works treat on the condition of nourishment in plants, on the functional assimilation of chlorophyl, on the motion of assimilated matter in plant tissues, on the influence of heat and light upon the growth of plants. Among them are *Vorlesungen über Pflanzen-Physiologie* (1882); *Geschichte der Botanik vom 16th Jahrhundert bis 1860* (1875). His *Gesammelte Vorlesungen über Pflanzen-Physiologie* appeared at Leipsic in two volumes (1892–93). G.A.S.

SACHSE, Julius Friedrich, journalist and author; was born in Philadelphia, Penn., on November 22, 1842, and became a journalist in that city. He has written a number of historical works on the early colonists of Pennsylvania, especially the Germans, and the German Pietists, Sectarians, Dunkers, the Ephrata Cloister and others. W.F.J.

SAC INDIANS. See *Sacs*, under Indians, Vol. XII, p. 870.

SACKBUT. See Trombone, Vol. XXIII, p. 623.

SACKETT'S HARBOR, a village and port of entry in Jefferson County, New York, on the south shore of Black River Bay, 8 miles E. of Lake Ontario and 170 miles N.W. of Albany, having a navy-yard, barracks, mills, etc. It is the best harbor on the lake for ship-building. The *Oneida*, the first United States war vessel ever launched on Lake Ontario, was built at Sackett's Harbor in 1809. In the War of 1812 it was an important port, where the frigate *Superior*, of 66 guns, was built in 80 days, and the *Madison* in 45 days, from timber standing in the forest. Population 1890, 787; 1900, 1,266.

SACKVILLE, New Brunswick, a seaport town of Westmoreland County, at the head of Cumberland Basin in the Bay of Fundy, and a junction of the Intercolonial and the New Brunswick & Prince Edward Island railroads, 100 miles northeast of St. John. It is an educational center with some manufactures. Pop., 1900, 1,875. C.L.S.

SACKVILLE, Lord George, better known in history as Lord George Germain, soldier; was born in England on January 26, 1716, a son of the Duke of Dorset. He entered the British army, and seems to have been at times a brave but untrustworthy soldier. He distinguished himself and was wounded at Fontenoy, in 1745; but at Minden, in 1759, where he commanded the cavalry, he failed to charge when ordered, and was court-martialed and dismissed from the service. He was colonial secretary in 1775–82, and was one of the evil geniuses of the British Government, seconding Lord North in his most fatuous policies. He inherited some estates in 1770 which required him to take the surname of Germain, and in 1782 was created Viscount Sackville. He was at one time, though probably incorrectly, suspected of the authorship of the letters of Junius (see Junius, Vol. XIII, p. 785). He died on August 26, 1785. W.F.J.

SACKVILLE, Lionel Sackville West, Baron, an English diplomatist; born July 19, 1827, at Bourn Hall, Cambridgeshire. He was educated at home; was assistant précis writer to the Earl of Aberdeen, Secretary of State for Foreign Affairs in 1845; entered the diplomatic service in 1847; served as attaché to her Majesty's legations in Lisbon, Naples, Stuttgart and Berlin, till 1858; as secretary of legation in Turin, Madrid and Berlin; and secretary of embassy in Paris till 1872; was appointed envoy extraordinary and minister plenipotentiary to the Argentine Republic (1873); transferred to Madrid (1878); and to the United States (1881). He negotiated, in conjunction with Sir James Hudson, the commercial treaty with Sardinia (1863); represented her Majesty's government and that of Denmark at the conferences of Madrid on the affairs of Morocco (1880); was minister plenipotentiary at the conference in Washington on the affairs of Samoa (1887); and negotiated, in conjunction with Mr. Joseph Chamberlain and Sir Charles Tupper, the fisheries treaty of Washington (1888). He received his passports from the United States government in 1889, and was recalled to England, owing to an injudicious letter written to a Mr. Osgoodby, who had sent him a letter of enquiry in the false name of Murchison. In his reply he stated that the election of a Democratic President would be received with favor in England. In 1895 he made himself ridiculous by the publication of an attempt at self-exculpation and an account of a bogus plot against his life.

SACKVILLE, Thomas. See Dorset, Earl, Vol. VII, pp. 322, 323.

SACO, Maine, a city of York County, near the falls of the Saco River, 15 miles southwest of Portland on two divisions of the Boston and Maine railroad, and the junction for the branch

line to Ocean Park and Old Orchard Beach, favorite summer resorts, 4 miles west on the Atlantic. The town has good schools and some manufactures. See SACO, Vol. XXI, p. 140. Population, 1890, 6,075; 1900, 6,122. C.L.S.

SACO, JOSÉ ANTONIO, author and statesman; was born at Bayamo, Cuba, in May, 1797. He was for many years a Cuban deputy in the Spanish Cortes, but was also several times exiled for political causes. He gave much attention to the question of slavery, and wrote a number of works, among them a *History of Slavery from the Earliest Times* and a *Comparison between Cuba and the British Colonies*. He died in Spain in September, 1879. W.F.J.

SACO RIVER. See MAINE, Vol. XV, p. 302.

SACRAMENTO, the capital of the state of California. It is on the Southern Pacific railroad. The United States reports for 1900 show the following in regard to the mechanical and manufacturing industries of Sacramento: Number of establishments reporting, 279; aggregate capital, $7,492,313; average number of employees, 4,582; average total wages, $3,210,028; total value of products, $11,785,621. The Crocker Art Gallery and the California State Bank are among the finest recent buildings. Sacramento has 22 churches, of which 6 are Methodist Episcopal, 4 Baptist, 3 Congregational, 2 Presbyterian, 2 Lutheran, 1 Protestant Episcopal, 1 Roman Catholic, 1 Unitarian, 1 Christian and 1 Jewish. The city has 1 high-school, 6 primary and 3 grammar-schools, 1 ungraded school and 1 night school. The school census for 1900 reports 120 teachers and 7,500 pupils. It has, besides, 6 private schools, 1 free public library and 1 state library; the latter is in the capitol building, and contains 100,000 volumes. Sacramento has a Protestant Orphan Asylum, City Dispensary, the Southern Pacific Hospital, Marguerite Home for Old Women, Woman's Christian Temperance Union Mission, the Children's Day Home, city and county jail. Population 1890, 26,386; 1900, 29,282. See also SACRAMENTO, Vol. XXI, p. 140.

SACRAMENTO RIVER. See CALIFORNIA, Vol. IV, p. 617.

SACRED HEART, LADIES OF THE, a Roman Catholic order of nuns, founded in France in 1800, by Joseph Varin, a Jesuit priest, and Madalene Josephine Barat, who became first superior-general of the congregation. Pope Leo XII gave the order his approval in 1826. Its rules and system of education are based upon those of the Jesuits, and its mother-house is located in Paris. The congregation was introduced into the United States in 1818, the first settlement being made by Philippine Duchesne, at Florissant, Missouri. From this point they spread through all parts of the United States.

SACRED HEARTS OF JESUS AND MARY, a Roman Catholic brotherhood founded at Lyons, France, in 1821, by André Coindre. The order was established in the United States at Mobile, Alabama, in 1847. Since that time the community has spread rapidly, its work being very largely educational.

SACRUM. See ANATOMY, Vol. I, p. 720.

SADDLE. See HORSE, Vol. XII, p. 202; and also SADDLERY, Vol. XXI, p. 150.

SADOWA, BATTLE OF. See KÖNIGGRÄTZ, Vol. XIV, p. 139.

SAFED, one of the holy cities of the modern Jews in Palestine, situated on a hill, 2,700 feet above the Mediterranean, 6 miles N.W. of the Sea of Galilee and 13 miles N.W. of Tiberias. The town was destroyed by an earthquake in 1837, which killed about four thousand Jews. Again, in 1859, the town was damaged and many lives were lost. A castle of the Christians, built during the Crusades, was destroyed by the sultan of Damascus in 1220, and, having been rebuilt by the Templars, was again destroyed in 1266. Safed is the seat of a noted Jewish school. Population, Jews, 12,000; Moslems, 5,000; and Christians, 200.

SAFE-DEPOSIT COMPANIES, corporations for the safe keeping of valuable personal property, as money, bullion, stocks, bonds, jewelry, plate, etc. Such companies are in operation in many of the large cities of the United States. Among the earliest of such companies in the United States are the Safe-Deposit Company, chartered in New York in 1861, and the Fidelity Safe-Deposit Company, established by Nathaniel B. Browne at Philadelphia in 1867. These companies are now to be found in all large cities in the United States, and they are authorized to act as trustees of all kinds of property in most states of the Union. In the state of New York they are organized under a general law enacted in 1872. This law authorizes the formation of stock companies for the purpose of taking and receiving upon deposit as bailees, for safe-keeping and storage, all kinds of valuable goods and papers, and guaranteeing their safety on such terms as may be agreed upon between them and their patrons. It also authorizes them to construct and let out safes, vaults and other receptacles necessary for their business purposes. The affairs of these companies are managed by trustees elected annually by the stockholders, the latter being jointly and severally liable for all debts equal to the par value of their stock. These corporations are under the supervision of the bank superintendent. They have to make semi-annual reports to the latter, and are subjected to annual examinations by him. On Jan. 1, 1888, the combined capital of the safe-deposit companies in the state of New York amounted to three millions of dollars. In most of the other states of the Union such companies are created by special legislative enactments, but their business is carried on after the same general plan as the business of the New York companies.

In all of these establishments strong fire-proof vaults are built. These are constructed of steel and iron plates welded together and surrounded with masonry. Their interiors are fitted up with tiers of safes and deposit-boxes of sizes suitable for all requirements. The whole is under the surveillance of armed watchmen both day and night. Minute personal descriptions of their patrons are entered into books kept for the purpose of identifying them. Private passwords are also given to the patrons and entered upon the books. On renting a safe the

holder is furnished with the only key or keys that will fit its lock, no others being the same. Also see SAFES, Vol. XXI, p. 153.

SAFETY APPLIANCES FOR MINES. Where a level of a mine meets the perpendicular shaft it is customary to place what is known as a chair, or landing-dog, which may be thrown out to support a mine-cage when it is stopped opposite the level. It was formerly the custom, in order that the engineer of the hoisting-apparatus might know the position of the different chairs, to connect them with the engine-room by means of wires and bell-cranks, operating pointers on dials. This method was not wholly satisfactory, affording opportunity for a variety of accidents, and it has been superseded in many mines within recent years by an electrical-chair indicator of simple construction, that secures greatly increased safety. It also expedites the work, as engineers do not have to slow down to feel for the chairs. Any form of annunciator or semaphore may be employed with this electrical indicator, but a system of red and white disks is usually preferred. When a chair is in a normal position, leaving the shaft clear, the circuit is closed and a white disk is displayed before the engineer, but if a chair is thrown into the shaft the circuit is opened and a red disk flashes out, eclipsing the white disk in front of the engineer. The method is so simple that an error is hardly possible, and in case of any accident to the wires, breaking the circuit, or if they should be willfully cut, the red danger-signal is promptly brought before the engineer.

Workmen have sometimes been injured by allowing long tools to project from a car in going up or down a shaft. To prevent such accidents a safety tool-car has been introduced, which overcomes the difficulty in a simple manner. The sides and ends of the car are made to slope inwardly from the bottom, so as to turn all unprotected points and handles toward the center of the shaft. These safety tool-cars are also conveniently arranged with hand-holes for propelling and links for attachment to the cages.

A safety device for mine-cages, which insures absolute support for the cages should the hoisting-rope break, has been largely introduced. At the sides of the shaft are placed a series of stout projecting stops. Thrust-pieces from the sides of the cage are arranged to be pushed into these by the action of the hoisting-rope in breaking, should such accident occur. A stout spring is set in the top of the cage, being held up and back by the strain of the hoisting-rope. The instant this strain is removed, as by breaking of the rope, the spring acts and forces the thrust-pieces against the stops on the side of the shaft, stopping the descent of the cage.

C. H. COCHRANE.

SAFETY-LAMP. See COAL, Vol. VI, p. 68.

SAFETY-VALVE. See STEAM-ENGINE, Vol. XXII, p. 519.

SAFFI. See SAFI, in these Supplements.

SAFFORD, TRUMAN HENRY, an American astronomer and mathematician; born in Royalston, Vt., Jan. 6, 1836. He graduated from Harvard College in 1854. He studied astronomy for several years and in 1863 was made assistant observer at the Cambridge Observatory. In 1865 he was appointed a director at the Dearborn Observatory and professor of astronomy in the University of Chicago. In 1873 he was astronomer of the United States surveys in the West under Captain Wheeler. In 1876 he was appointed professor of astronomy at Williams College and in 1899 built a meridian observatory there. He published a star catalogue and a catalogue of right ascensions of close polar stars. He also predicted the position of the companion of Sirius. His books include *Mathematical Teaching and Its Modern Methods*. He is a fellow of the Royal Astronomical Society of England, American Academy of Arts and Sciences and the American Association of Advanced Science. Died in 1901.

SAFFRANINE, $C^{18}H^{14}N^4$ or $C^{18}H^{16}N^4O$, a red dye prepared by oxidizing a mixture of certain aniline bases and belonging to the group of phenazine dyes. A number of derivatives are known, and are used to dye silk and wool various shades of red or scarlet.

SAFI OR SAFFI, a seaport of Morocco, Africa, 120 miles W.N.W. of the city of Morocco. It is surrounded by walls, ditches and a ruined citadel, and is built at the bottom of a ravine. The place was held by the Portuguese for many years up to 1648, when they abandoned it. The shrine of the Seven Sleepers here is visited by both Moslems and Jews. Safi at one time had a large trade with Europe, but has declined much since the rise of Mogador. Population, 9,000.

SAGA. See EDDA, Vol. VII, pp. 563–565; and also, SNORRO STURLUSON, Vol. XXII, p. 212.

SAGAR OR SAUGOR, India, an island of the Sundarbans in the delta of the Ganges, at the Hugli outlet, 60 miles southwest of Calcutta. It is a holy bathing resort for Hindu pilgrims, who flock thither in great numbers. The island is low-lying, covered with swamps and jungle infested by tigers, and other animals. C.L.S.

SAGASTA, PRAXEDES MATEO, statesman; was born at Torrecilla, Spain, on July 21, 1827, and became a civil engineer. In 1854 he entered politics as a deputy in the Cortes from Zamora. He took part in the revolt of 1856 and had to flee to France, but returned, was professor of engineering at Madrid, founded *La Iberia*, a Liberal paper, and resumed his place in the Cortes. Again, in 1866, he was a revolutionist and had to flee, but in 1868 became minister of the interior in the provisional government. He was president of the Cortes in 1871, and in the next few years was minister of the interior, foreign minister and prime minister. In 1881–83 he was again prime minister, a third time in 1885–90, a fourth time in 1892–95, a fifth time in 1897–99, and for the sixth and last time in 1901. He was a man of great ability and of sterling integrity, who rendered invaluable services to his country. He saved it from anarchy after the death of Alfonso XII, and strove valiantly but in vain to settle the Cuban troubles without war with the United States. He

was a consistent Liberal, and commanded more confidence than almost any of his contemporaries. He died on January 5, 1903. W.F.J.

SAGE, HENRY WILLIAMS, an American capitalist and philanthropist; born in Middletown, Conn., Jan. 31, 1814. In 1827 he moved to Ithaca, N. Y., and in 1832 entered business there. He was largely interested in the lumber business in Canada and Michigan, and became one of the largest landholders in the latter State. From 1857 to 1880 he lived in Brooklyn, N. Y. He was actively interested in the founding of Cornell University, and in 1873 built a hall for women, known as Sage College. In 1874 he was elected president of the board of trustees, and gave numerous other large gifts to that institution amounting to over $1,000,000. He died in Ithaca, Sept. 18, 1897. E.E.T.

SAGE, RUSSELL, an American capitalist; born in Verona Township, Oneida County, N. Y., Aug. 4, 1816. He was brought up on a farm; attended school during winters; and began business life as errand-boy in his brother's grocery store in Troy, N. Y.; later becoming clerk and salesman in the same occupation. He was in business as a retail grocer, 1837–39, and as a wholesale grocer, 1837–57. He was an alderman in 1847, and, later, treasurer of Rensselaer County, and sat in the national House of Representatives, as a Whig, from 1853 to 1857. He became interested in railways and telegraphs, removed to New York in 1863, and engaged in money-lending and stock-exchange transactions. In 1891 he escaped assassination by a bomb, by interposing the person of a bystander between himself and the danger. He died in 1906.

RUSSELL SAGE.

SAGE–BRUSH, the common name given to the numerous species of *Artemisia*, of the family *Compositæ*, natives of the plains and western mountains of North America. They are low shrubs or herbs, bitter-aromatic, with alternate leaves and small heads of yellowish or whitish flowers.

SAG HARBOR, New York, a village and port of entry on long Island, in Suffolk County, 100 miles east of New York city. It is on an inlet of the southern shore of Gardiner's Bay, and is the terminus of a division of the Long Island railroad. The village was incorporated in 1803 and was originally an important whale fishing port. It is a summer resort and has an active shipping trade, passengers and transit, during the season, with Connecticut and New York ports. Its industrial establishments include one of the largest watch-case factories in the world, silver works, and other manufactures. Sag Harbor is the seat of the Roman Catholic Convent of the Sacred Heart of St. Mary's. Population, 1890, 2,640; 1900, 1,969. C.L.S.

SAGINAW, Michigan, the seat of Saginaw County, a city at the head of steamer navigation on the Saginaw River, 23 miles from its mouth in Saginaw Bay on Lake Huron, and 98 miles by rail northwest of Detroit on the Cincinnati, Saginaw & Mackinaw main line, and on five divisions of the Pere Marquette system. In 1890 Saginaw and East Saginaw on opposite banks of the river were consolidated as one city (see EAST SAGINAW, Vol. VII, p. 533, and SAGINAW, Vol. XXI, p. 156). The city has been largely rebuilt and has many fine public buildings, erected since a destructive fire in 1893 destroyed the best quarter. Its industrial and commercial importance is great; it is the center of a large beet-sugar producing region and has extensive manufacturing establishments. Population, 1890, 46,322; 1900, 42,345. C.L.S.

SAGINAW RIVER, Michigan, 32 miles long, is formed by the Union of the Cass River from the east, the Flint and Shiawassee rivers from the south, and the Tittibawasse from the northwest. It flows northeast into Saginaw Bay, a deep indentation of Lake Huron, on the western shore, and is an important outlet for the lumber and other industries of the Michigan Peninsula. It is navigable by small steamers for 24 miles. SAGINAW BAY, 60 miles long and 30 miles wide, is much frequented for its valuable fisheries. C.L.S.

SAGUENAY RIVER. See QUEBEC, Vol. XX, p. 171.

SAHARA OR GREAT DESERT. See SAHARA, Vol. XXI, p. 157, and AFRICA, in these Supplements.

SAÏD PACHA. See EGYPT, Vol. VII, p. 663.

SAIL–FISH, the popular name of fishes of the genus *Histiophorus*, characterized by a large dorsal fin, which by its resemblance to a sail has suggested the name. The greatly modified ventral fins are composed of several long slender rays. The sail-fishes, also known as banner-fishes, are found in warm seas, especially the Indo-Pacific. They are very active fishes, like their near relatives, the sword-fishes.

SAINT AFFRIQUE, a town in the southern part of France in the department of Aveyron, 18 miles S. of Millau and 41 miles N. W. of Montpellier, on the South railroad. It manufactures cloths, serges and wines. Population 4,492.

ST. ALBANS, Vermont, the seat of Franklin County, since 1890 chartered as a city (see ST. ALBANS, Vol. XXI, p. 165). Besides its railway, canning, and celebrated dairy industries, it manufactures furniture, agricultural implements, and radiators. Population, 1890, 7,771; 1900, 6,239. C.L.S.

ST. ANDREW, ORDER OF. See ANDREW, in these Supplements.

ST. ANDREWS, a seaport town of New Brunswick, Canada, 60 miles S.W. of St. Johns. It is a summer and bathing resort, and has a tidal harbor 35 feet deep. Population, 2,500.

ST. AUGUSTINE, a town of Florida. The majority of the population are Roman Catholics, though the other religious denominations are well repre-

sented. The Memorial Presbyterian Church is a famous structure. There are good schools and colleges, and there is an institution for the education of the deaf and blind. Cigar-making is the only manufacturing industry. Population, 1900, 4,272. See also St. Augustine, Vol. XXI, p. 167.

ST. BARTHOLOMEW'S DAY MASSACRE. See France, Vol. IX, p. 495.

ST. BERNARD DOGS. See Dogs, Vol. VII, pp. 283, 284.

ST. BERNARD, The Great, Switzerland, a mountain of the Pennine Alps in the canton of Valais on the Italian frontier. It rises to a height of 10,113 feet, and is famous for its pass from Aosta to Martigny between the Valais and the valley of St. Remy. At the highest point of the pass 7,860 feet above sea-level and 6 miles from St. Remy, near a little lake, is the hospice and convent founded in 962 by St. Bernard of Menton, on the site of a Roman temple dedicated to Jupiter, after whom the mountain was anciently called *Mons Jovis*. The hospice is maintained by voluntary subscriptions, and twelve monks of the Augustinian order live there all the year round, during the winter months daily patrolling the pass with their celebrated dogs to assist travelers, who are entertained gratuitously. Before the construction of the Alpine railway tunnels 20,000 persons were lodged at the hospice annually. The pass was the route for invading armies from Roman times. C.L.S.

ST. BERNARD, The Little, France, a mountain of the Graian Alps, in the department of Savoie near the Moutiers; height, 8,334 feet. A pass connects the valleys of the Isère and Dora and in a small valley at a height of 6,306 feet is the hospice of the Little St. Bernard, a branch of the Great St. Bernard (see above). C.L.S.

ST. BONIFACE, Canada, a town of Manitoba, opposite Winnipeg, on the Red River, and connected by several bridges. It is an important Roman Catholic center with a cathedral and diocesan establishment, and numerous good schools. It also has manufacturing interests and shares in the commerce and railway transportation facilities of its larger neighbor. Population, 1891, 1,553; 1901, 2,019. C.L.S.

ST. BRENDAN or BRANDAN. See Celtic Literature, Vol. V, pp. 264, 282, 283.

ST. CATHARINES, a city of Ontario, Canada. Population, 1901, 9,946. See St. Catharines, Vol. XXI, p. 168.

ST. CÉSAIRE, Canada, the seat of Rouville County, southern Quebec, on the Yamaska River and terminus of a branch line of the Central Vermont railroad, 30 miles east southeast of Montreal. The French Roman Catholic College of the Ste. Croix and other higher educational establishments are situated here. Population, 1901, 865. C.L.S.

ST. CHARLES, Illinois, a city and railroad junction in Kane County, on the Fox River, and on the Chicago, Great Western and the Chicago & Northwestern railroads, 38 miles west of Chicago. It is in a farming and dairying region exporting cattle and allied products, and manufacturing hardware, machinery, etc. Population, 1890, 1,690; 1900, 2,675. C.L.S.

ST. CHARLES, a city of Missouri. Population, 1900, 7,982. See St. Charles, Vol. XXI, p. 168.

ST. CLAIR, Michigan, a city and summer resort of St. Clair County on the St. Clair River, midway between Lake Huron and Lake St. Clair, and 12 miles by rail south of Port Huron, on the Detroit & Port Huron Shore Line. It is opposite Courtright, a town and railway junction of Lambton County, Ontario, Canada, with which it communicates by ferry. It has shipbuilding yards, milling and other industries. Population, 1890, 2,353; 1900, 2,543. C.L.S.

ST. CLAIR, Pennsylvania, a coal-mining borough of Schuylkill County, on divisions of the Pennsylvania and the Reynoldsville & Falls Creek railroads, 3 miles north of Pottsville. See St. Clair, Vol. XXI, p. 168. Population, 1890, 3,680; 1900, 4,638. C.L.S.

ST. CLAIR, lake and river. See St. Lawrence, Vol. XXI, p. 188.

SAINT CLAIR, Arthur, an American soldier; born in Thurso, Scotland, in 1734. In 1757 he became an ensign in the 60th Foot, and came to America in 1758; served under Amherst at Louisburg; was made a lieutenant in 1759; and distinguished himself at Quebec under Wolfe. He resigned his commission in 1762, and in 1764 settled in the Ligonier valley, Pa. He became colonel of militia in 1775; colonel of the 2d Pennsylvania regiment, Jan. 3, 1776; joined Sullivan in Canada and was in the disaster at Three Rivers; became brigadier-general, Aug. 9, 1776, and major-general, Feb. 19, 1777. In November, 1776, he joined Washington, and was appointed to organize the New Jersey militia. He was engaged in the battle of Princeton, and later became adjutant-general of the army. He was driven from Fort Ticonderoga in 1777, but was honorably acquitted of charges. He sat on the court martial that condemned André, and participated in the surrender of Cornwallis at Yorktown. In 1791, being general-in-chief of the army, he suffered a severe defeat by Indians of the Wabash, and in 1792 he resigned his commission. He died in poverty in Greensburg, Pa., Aug. 13, 1818. E.E.T.

ST. CLAIRSVILLE, a village and the capital of Belmont County, eastern Ohio, 10 miles W. of Wheeling, West Virginia, on the St. Clairsville division of the Baltimore and Ohio railroad and on the St. Clairsville and Northern railroad. Coal and limestone occur abundantly in this district. Population 1890, 1,191; 1900, 1,210.

ST. CLOUD, Minnesota, the seat of Stearns County, a city on the Mississippi River, and an important junction of four divisions of the Great Northern railroad, and one of the Northern Pacific system, 65 miles northwest of Minneapolis. Among its institutions are a state normal school, state reformatory, and St. Raphael's Roman Catholic Hospital. Granite quarrying, lumber-

ing, and several factories utilize the water power supplied by the river. Population, 1890, 7,686; 1900, 8,663. C.L.S.

ST. CROIX RIVER. See NEW BRUNSWICK, Vol. XVII, p. 382.

ST. CROIX RIVER, Wisconsin, a tributary of the Mississippi, flowing from Upper St. Croix Lake in Douglas County, on the south side of the ridge overlooking Lake Superior. Fed also by numerous small streams from the same ridge, it has a winding west by south and southeastern course of 150 miles, a little above its junction with the Mississippi at Prescott, expanding into the Lower St. Croix Lake. It is navigable for over 50 miles. C.L.S.

SAINT CUTHBERT'S BEADS. See *Crinoidea*, under ECHINODERMATA, Vol. VII, p. 552.

ST. DENIS REUNION. See REUNION, Vol. XX, pp. 505–507.

ST. DIZIER, France, a town in the department of Haute-Marne, on the Marne River, 13 miles by rail S.W. of Barle-Duc. It is a metal-manufacturing, and historic center. Population, 10,082. C.L.S.

STE. ANNE DE BEAUPRÉ, Canada, a village and pilgrimage resort of Montmorency County, Quebec, on the north bank of the St. Lawrence River, at the confluence of the Ste. Anne River, 20 miles by rail northeast of Quebec city. The ancient seventeenth century church, and a handsome modern basilica, containing relics of Ste. Anne, and valuable paintings, are notable buildings. Ste. Anne's Falls, and other scenic attractions also make Ste. Anne a frequented summer resort. Population, 1901, 360. C.L.S.

STE. GENEVIEVE, Missouri, the seat of Ste. Genevieve County, a city on the Mississippi River, and terminus of the Chester, Perryville and Ste. Genevieve railroad, 60 miles southeast of St. Louis. It shares in the steamer transit facilities of the river and has flouring mills, foundries, and manufactures of agricultural implements, bricks, lime, etc. Population, 1900, 1,707. C.L.S.

ST. ELIAS, a mountain in the northwest of North America on the boundary line between the United States and Canada, in lat. 60° 17′ 34.4″ N., and long. 140° 55′ 19.6″ W. Its height as determined by the United States Coast and Geodetic Survey is 18,100 feet. It is not volcanic, nor is it, as was long reputed, the highest peak in North America, being surpassed by Mt. McKinley in Alaska, Mt. Orizaba in Mexico, and Mt. Logan in Canada, 26 miles N.E. of St. Elias. It was ascended on July 30, 1897, by Prince Louis Amadeus, of Savoy, and party.

ST. FRANCIS RIVER, Quebec, a southern affluent of the St. Lawrence River, flowing south from Lake St. Francis, in Beauce County to Lennox in Sherbrooke County, where it turns and follows a northwesterly course to its junction with the St. Lawrence at Pierreville Mills on Lake St. Peter. It is 120 miles long, is unnavigable, owing to its rapids, but yields abundant power for mills along its course. C.L.S.

ST. FRANCIS RIVER, rises in Saint François County, Missouri, and flowing south forms the boundary between Butler and Stoddard counties, entering Arkansas just above St. Francis city in Clay County. Below St. Francis it forms the wide expansions of Sunk Lands and other large bayous or lagoons extending some distance southward. It receives the waters of Big Lake and Little River from the east and finally enters the Mississippi a little distance above Helena in Phillips County In flood time the river is navigable for nearly 200 miles. C.L.S.

ST. FRANCIS XAVIER, THE COLLEGE OF. This college is located in New York city, and conducted by the fathers of the Society of Jesus, and intended for day scholars only; was founded in October, 1847, and in January, 1861, was endowed by the regents of the University of the State of New York with full collegiate powers and privileges. The course of studies comprises two distinct departments: the graduate school and the college proper. The college course is a liberal training in languages, science, history, ethics, Christian doctrine and oratory. There were in 1904, 30 instructors and 750 students. W.R.B.

ST. GALL MONASTERY. See ABBEY, Vol. I, pp. 18, 19.

SAINT GAUDENS, AUGUSTUS, an American sculptor; born in Dublin, Ireland, March 1, 1848. He came to the United States in infancy; learned the trade of cameo-cutter; studied drawing at Cooper Institute in 1861; was a student at the National Academy of Design, 1865–66; and at the École des Beaux Arts, Paris, 1867–70. He lived in Rome, 1870–72, producing there his first figure, *Hiawatha*, in 1871; and settled in New York in 1872. Among his works are: *The Adoration of the Cross* (in St. Thomas's Church, New York); *The Puritan; Diana* (on the tower of Madison Square Garden, New York); statues of Abraham Lincoln and of John Logan, Chicago; of Admiral Farragut and Peter Cooper, New York; of Col. R. G. Shaw, Boston; the monument to Gen. Sherman, New York; and numerous other statues, busts, etc. He is a corresponding member of the Institute of France; and an officer of the Legion of Honor. He received a medal of honor in Paris, 1900, and a special medal of honor at Buffalo, 1901. He died August 3, 1907. E.E.T.

AUG. ST. GAUDENS.

SAINT GAUDENS, LOUIS, an American sculptor; born in New York, Jan. 8, 1854. He studied at the École des Beaux Arts, 1879–80, assisted his brother Augustus (see above) in numerous works, and has produced a *Faun*, etc. E.E.T.

SAINT GEORGE, a town, the capital of Washington County, southwestern Utah, on the Virgin River, about 230 miles S.W. of Salt Lake City; is the chief trade-center in the rich valley of the

Virgin River. Its principal industries are a tannery and a broom factory. Pop., 1900, 1,600.

ST. GEORGE'S. See BERMUDA ISLANDS, Vol. III, p. 518.

ST. GEORGE'S. See GRENADA, Vol. XI, p. 164.

ST. GEORGE'S CHANNEL, the passage on the western coast of Great Britain from 50 to 95 miles wide, separating Ireland. It connects the Irish Sea with the Atlantic and extends N. to S. 100 miles along the coast of Wales from Anglesey and Holyhead to St. David's Head, and along the Irish coast from Dublin to Wexford. C.L.S.

ST. GOTTHARD TUNNEL. See TUNNELING, Vol. XXIII, p. 664.

SAINT HELENA, California, a town in Napa County, situated in a valley between two ridges of the Coast Range, on the South Vallejo and Calistoga division of the Southern Pacific railroad, 60 miles northeast of San Francisco. It is a pleasant summer and winter resort in a vine and olive-growing region producing wine and oil, and having some mining and manufacturing industries. Population, 1900, 1,582. C.L.S.

ST. HELIER. See JERSEY, Vol. XIII, p. 646.

ST. HYACINTHE, a city and the capital of St. Hyacinthe County, south-central Quebec, Canada, on the left bank of the navigable Yamaska River, and on the Grand Trunk railroad, 32 miles E.N.E. of Montreal. Is in the center of a rich agricultural and lumber district; has lumber-mills and manufactories of woolen goods, leather, woodenware, iron castings; has many fine buildings, including the bishop's palace and the main building of a Catholic college. Population, 1891, 7,016; 1901, 9,210.

ST. IGNACE, a city and the capital of Mackinac County, southeastern part of the upper peninsula of Michigan, on the Straits of Mackinac, and on the Duluth, South Shore and Atlantic railroad, of which it is the terminus; opposite Mackinaw City, and 45 miles N. of Petoskey. Has a fine harbor, making it a terminal port for several lines of steamers and a port of call for others. Principal industries are iron-mining, manufacturing, shipping of lumber and fish. In its early days St. Ignace was the seat of a Jesuit mission, and contains a church built by Jacques Marquette, the oldest in northern Michigan. Population, 1890, 2,704; 1900, 2,271.

ST. JEROME, Canada, the seat of Terrebonne County, a town in southwestern Quebec, north of the St. Lawrence River, on the Rivière du Nord and at a junction of divisions of the Great Northern and the Canadian Pacific railroads, 28 miles northwest of Montreal. Lumber, flour, and woolen mills are supplied with abundant power from the river which has a rapid descent of 300 feet in four miles above the town. Population, 1891, 2,868; 1901, 3,619. C.L.S.

SAINT JOHN, JOHN PIERCE, an American public man; born in Brookville, Ind., Feb. 25, 1833. He received a frontier education, and joined the Union army from Illinois, serving as captain and lieutenant-colonel. He settled in Kansas; was elected to the Kansas Senate in 1872; and was governor of the state, 1879–83. In 1884 he was nominated for President on the ticket of the Prohibitionist party but was defeated, and has since then actively supported the free coinage of silver and woman suffrage, opposed the war against the Filipinos, and supported the doctrines of William J. Bryan. E.E.T.

ST. JOHN, PERCY BOLINGBROKE, traveler and author, son of James Augustus St. John (q. v., Vol. XXI, p. 182); was born at Plymouth, England, on March 4, 1821. He became a traveling companion of his father in the East, and also visited North America, spending some time in the United States, Texas and Mexico, and serving in the Texan army during the brief existence of that republic. He settled in Paris in 1847 as an English newspaper correspondent and man of letters, and wrote many volumes and innumerable articles for magazines and reviews. Among his books were a *Young Naturalist's Book of Birds* (1844); *Three Days of the French Revolution* (1848); *The Book of the War* (1853); *Arctic Crusoe* (1854); *The Snow Ship* (1865); *As Good as Gold* (1875), and *A Daughter of the Sea* (1884). He died on March 15, 1889. W.F.J.

ST. JOHN LAKE, Canada, in Chicoutimi County, northern Quebec, is 28 miles long with a maximum width of 25 miles and an area of 360 square miles; its chief feeders are the Peribonka, Mistassini, Chamouchouan, and the Metabetchouan; its outlet is the Saguenay River (see QUEBEC, Vol. XX, p. 165). From Quebec, 125 miles to the south, the Quebec and Lake St. John railroad reaches Roberval and other villages and angling resorts on its shores. C.L.S.

ST. JOHN RIVER. See NEW BRUNSWICK, Vol. XVII, p. 382.

ST. JOHNS. See ANTIGUA, Vol. II, p. 113.

ST. JOHNS, a town and the capital of St. Johns County, southern Quebec, Canada, 23 miles S.E. of Montreal, on the Richelieu River, and at the junction of the Vermont Central, the Grand Trunk and the Canadian Pacific railroads. Besides the manufacture of earthenware goods, which is the leading industry, it has foundries, tanneries, saw, grist and planing mills, etc., and carries on a large trade in lumber, grain and farm produce. Population, 1891, 4,722; 1901, 4,030.

SAINT JOHN'S, Michigan, the seat of Clinton County, a village of Bingham township on a division of the Detroit, Grand Haven & Milwaukee railroad, 60 miles east of Grand Rapids. It is the market center of an extensive farming and fruit-growing region; and its manufacturing industries include a notable output of tables, while gasoline engines and farming implements also are manufactured. Population, 1900, 3,388. C.L.S.

ST. JOHNSBURY, Vermont, the seat of Caledonia County, a town and village on the Passumpsic River, 8 miles above its confluence with the Connecticut River, and 37 miles northeast of Montpelier on divisions of the Boston & Maine, and the St. Johnsbury & Lake Champlain railroads. Its healthful climate and diversified scenic attractions make it a favorite summer resort.

It has long been noted as the seat of the Fairbank's scale industries and of the educational institutions founded by the firm. (See ST. JOHNSBURY, Vol, XXI, p. 185.) Hardware, lumber, furniture, crackers and minor articles also are manufactured. Population, 1900, of town, 7,010, including village, 5,666. C.L.S.

ST. JOHN'S COLLEGE, founded at Annapolis, Maryland, in 1789, being a development of King William's School, which was established in 1696. The college is non-sectarian, and in addition to the usual courses in languages and science, there are departments in mental and moral science, political economy, history, law, mechanical engineering, military science and tactics. The total income (1904) amounts to $45,000. There are 13 instructors and 200 students. W.R.B.

ST. JOHN'S RIVER, a stream rising in Brevard County, eastern Florida, and for a course of nearly 350 miles flows in a northerly direction through the same state, emptying into the Atlantic Ocean in Duval County, about 15 miles N.E. of Jacksonville. Steamboats of large size navigate the river as far as Enterprise. For two-thirds of its course it is nowhere less than a mile in width, and for 100 miles from its mouth resembles a lagoon more than a river. It is fed by springs and the overflow of swamps, and passes through a level region abounding in orange groves.

ST. JOHN'S UNIVERSITY, a Roman Catholic institution of learning located at Collegeville, Minnesota. Founded in 1857 by the Very Reverend Demetrius Maronga, its first president. It was empowered to confer university degrees in 1869, and in 1878 received Pontifical authority to confer the doctor's degree in theology, philosophy and canon law. The cost of tuition is $50 per annum, and living expenses $150. Extra fees, $25. Total income (1904), $28,000. There are 30 instructors and 300 students. W.R.B.

ST. JOHNSVILLE, New York, a town and village of Montgomery County, in the Mohawk Valley on the Erie canal, and on divisions of the West Shore and the New York Central & Hudson River railroads, 64 miles northwest of Albany. It has agricultural industries, knitting mills, and piano factories. Population, 1900, of town, 2,674, including village, 1,873. C.L.S.

ST. JOHNSWORT FAMILY, the common name given to the family *Hypericaceæ*, distinguished by its opposite and entire leaves, which bear transparent and sometimes blackish dots, its numerous stamens often in clusters, and a many-seeded pod. The largest genus is *Hypericum*, represented in our flora by numerous species.

SAINT JOSEPH, a post village of Berrien County, southwestern Michigan, at the mouth of the Saint Joseph, on Lake Michigan, and on the Chicago and West Michigan and the Vandalia Line railroads, 22 miles N. of Niles and 60 miles by water N.E. of Chicago. It is engaged in the production of lumber, machinery and flour, and in shipping fruit. Population 1900, 5,155.

ST. JOSEPH, a city and the capital of Buchanan County, northwestern Missouri. (For article giving its history until 1880, see ST. JOSEPH, Vol. XXI, p. 185.) In 1900 it had 440 manufacturing establishments, employing 7,991 persons. The leading industries include manufactories of men's clothing, and slaughtering and meat-packing (wholesale), the value of the latter yield, in 1900, being over $19,000,000. Among the notable buildings erected since 1880 are the United States government building, the union depot and free public library building. In addition to being a manufacturing city of note, St. Joseph is also an important shipping-center of cattle and hogs and grain, including corn, oats and wheat. The period from 1880 to 1890 was marked by a large increase in population, the number of inhabitants of the city increasing from 32,431 in the former year to 52,324 in the latter. The corporate limits in 1895 included seven square miles, and extended two and a half miles back from the river. Pop. 1900, 102,979.

ST. LAWRENCE CANAL. See CANAL, in these Supplements.

ST. LAWRENCE UNIVERSITY, an educational institution located at Canton, New York. It was founded in 1856 by the Universalists, and formerly comprised three departments—the academy, the college, and the theological seminary. The academy has been dropped, and the other two, while under the same board of trustees, are entirely independent of each other, both in educational and financial affairs. Besides a campus of 27 acres with buildings and equipments, the college has an endowment fund of about $190,000, and the seminary about $166,000. Both departments are open to women, and in 1907 had 542 students, 24 instructors in the college and 10 in the seminary, 35,000 volumes in the library, and a total income of $22,200.

ST. LOUIS, Michigan, a city of Gratiot County, prior to 1890 a village, on the Pine River, and on the Saginaw and Elmdale division of the Pere Marquette railroad, 8 miles north of the county seat Ithaca, and 34 miles west of Saginaw. It is the seat of Yerington's College and has medicinal mineral springs which have given it a reputation as a health resort. The manufacturing industries are those of a farming region and include lumber mills, foundry and machine shops, salt works and chemical works. Population, 1890, 1,322; 1900, 1,403. C.L.S.

ST. LOUIS, a city of eastern Missouri. (For general article, see ST. LOUIS, Vol. XXI, pp. 192–195.) In 1890 there were in St. Louis 336.58 miles of improved streets, 76.44 miles of paved alleys, 311.09 miles of public and district sewers. The sewer system is most extensive, surface-drainage being unknown in the city. The largest sewer, known as the Mill Creek, following the line of a natural drain, is 20 feet wide and 15 feet high. Local transit is carried on by cable and electric lines, which operate 250 miles of track, and electricity and gas furnish the means of lighting the city. The public parks in 1890 covered an area of 3,200 acres, and among the buildings of note erected since 1880 may be mentioned the new

City Hall, cost $2,000,000, and the Union Railway station, one of the finest railroad depots in the world, having a train-shed covering 30 tracks, and costing, with the ground, $6,500,000. The churches of the city include representatives of the leading denominations and number about 230, some of the more important ones being the Roman Catholic Cathedral, Christ Church (Protestant Episcopal), Grand Avenue Presbyterian Church, Church of the Messiah (Unitarian), First Presbyterian and the Pilgrim Congregational churches. The school census of 1901–02 showed over 75,000 pupils enrolled, and buildings valued at $3,500,000; $91,214 was spent (1902) on the public library. Besides the public schools the city has numerous private and parochial schools

UNION DEPOT, ST. LOUIS.

of primary and grammar grade, besides being the seat of a large number of institutions for higher education and professional training, among them Washington University (q.v., in these Supplements), St. Louis University (Roman Catholic), Christian Brothers' College (Roman Catholic), Concordia Theological Seminary (Lutheran), Beaumont Hospital Medical College, St. Louis College of Pharmacy, St. Louis Training School for Nurses, St. Louis Law School, St. Louis School of Fine Arts, and several institutions for deaf-mutes and the blind. In 1901 there were 35 libraries of 1,000 volumes and over, having a total of 394,636 bound volumes, of which the Free Public Library contained 90,000 volumes, the Mercantile, 88,300; the St. Louis University, 30,000; the St. Louis Law School, 18,138; and the St. Louis Academy of Science, 16,000. There were in 1899, 12 daily and 61 weekly papers, besides a large number of fortnightly, monthly, bimonthly and quarterly periodicals.

The census returns for 1900 show that the city had in that year 6,732 manufacturing establishments, with a combined capital of $162,179,331, paying $49,185,696 to 92,450 persons, and $115,458,275 for materials from which were turned out products valued at $233,629,733. The leading industries were: Tobacco, chewing, smoking, and snuff; capital, $6,757,781, products, $24,411,307; slaughtering and meat packing, $2,512,805, products, $12,267,532; foundry and machine shops, $9,582,677, products, $11,628,140; men's clothing, $4,426,968, products, $8,755,697; women's clothing, $990,456, products, $2,987,446; coffee and spice, $2,271,298, products, $4,765,564; carriages and wagons, $2,466,202, products, $4,033,799; steam railroad cars, $2,880,982, products, $4,974,662; street railroad cars, $2,740,655, products, $2,406,836; chemicals, $1,969,875, products, $1,804,090; confectionery, $1,248,547, products, $2,997,685; publishing houses, $7,053,523, products, $9,816,455; flouring and grist-mills, $1,386,107, products, $4,004,062; furniture, $2,759,567, products, $3,268,765. The civic receipts for 1902 amounted to $9,261,218, and the expenditures to $8,470,478. These sums include the water works revenue and expenditure. The total bonded debt of the city is $18,916,278. Its assessed valuation of real estate property in 1902 amounted to $329,659,090, while the value of personal property was $60,294,640. The tax levy for the year was $1.30 on the $100 valuation. Owing to its transportation facilities by rail and water, St. Louis is an important shipping center. The receipts of freight amounted in 1899 to 15,133,448 tons, and the shipments to 8,350,128 tons.

St. Louis is an interior port which may be entered by foreign goods without appraisement at the original port of reception, and had imports for the fiscal year ending June 30, 1893, valued at $3,305,351. St. Louis has five bridges, three across the Missouri River and two across the Mississippi River, these latter being the Illinois and St. Louis or Eads bridge, and the Merchants' bridge, completed Dec. 31, 1889, at a cost of $3,000,000. On the afternoon of May 27, 1896, one of the fiercest cyclones ever known in the West brought disaster upon the city of St. Louis. The storm swept through the heart of the city, wrecking many buildings; crossed the river, demolishing warehouse property and shipping and wrecking the upper works of the Eads bridge, and passed over East St. Louis, doing a vast amount of damage. The fatalities for the two cities were estimated at 388; the injured in St. Louis about 1,000, and a property loss for the latter city of from $22,000,000 to $50,000,000. Population 1880, 350,522; 1890, according to United States census, 451,770; according to the 12th census (1900), 575,238.

ST. LOUIS, a river. See ST. LAWRENCE, Vol. XXI, pp. 186, 187.

ST. LOUIS UNIVERSITY, an educational institution for men at St. Louis, Missouri; established

ST. LOUIS UNIVERSITY BUILDING.

in 1829, and maintained by the Roman Catholic Church. In 1907 there were 840 students in

attendance, 164 instructors, and a library of 55,000 volumes. The larger portion of the student body is enrolled in the preparatory department. Inclusive of the year 1904, the graduates from the foundation of the institution numbered 1,219.

ST. MARGUERITE ISLANDS. See LERINS, in these Supplements.

ST. MARTINSVILLE, Louisiana, the administrative seat of St. Martin Parish, a village on the Bayou Teche at the head of steamboat navigation from the Gulf of Mexico, and on a division of the Southern Pacific Company railroad, 178 miles west of New Orleans. It is an agricultural and manufacturing center exporting cotton, sugar-cane, corn, rice and other products. Population, 1890, 1,814; 1900, 1,926. C.L.S.

ST. MARY'S, Ohio, a township and village of Auglaize County on the St. Mary's River, the Miami and Erie canal, two divisions of the Lake Erie & Western system, and the main line of the Columbus & Northwestern railroad, 105 miles west-northwest of Columbus. Near the village is the Grand Reservoir with a superficial area of 17,000 acres, and the main feeder of the Wabash River. The industries are connected with the natural gas and oil wells, and the agriculture of the neighborhood, and there are manufactures of machinery, woolens, strawboard, linseed oil, etc. Population, 1900, of village, 5,359. C.L.S.

ST. MARYS, a village and port of entry, the capital of Camden County, southeastern Georgia, about 32 miles S. of Brunswick, on the St Marys River, at its confluence with Cumberland Sound. It has a fine harbor, admitting large vessels. The principal industry is in the sawing of lumber. Population 1890, 575; 1900, 520

ST. MARYS, a village of Pottawatomie County, northeastern Kansas, near the Kansas River, on the Union Pacific railroad. It has flour and lumber mills, and is the seat of St. Marys College, a Roman Catholic institution of learning for the education of young men. In the reports for 1904 it had 30 instructors, 310 students, a library of 15,063 volumes and a yearly income from tuition of $18,600. Population, 1890, 1,174; 1900, 1,390.

ST. MARYS, a village of Marion County, north central Kentucky, about 5 miles W. of Lebanon and 50 miles S.S.E. of Louisville, on the Lebanon branch of the Louisville and Nashville railroad. It is in a county whose surface is hilly and in parts heavily wooded, abounding in limestone, and producing corn, oats, wheat and cattle. The village is the seat of St. Mary's College, a Roman Catholic institution for the education of young men, which in 1904 had 10 instructors, 130 students, and a library of 4,700 volumes. Population, St. Mary district, 1900, 1,300.

ST. MARYS, Ontario, a town and railway junction of Perth County, in the southwest of the province, on the Thames River, and on two divisions of the Grand Trunk railroad, 22 miles north of London, and 70 miles southeast of Goderich on Lake Huron. The river furnishes abundant power for oatmeal, flour, flax and woolen mills, and valuable limestone is quarried in the neighborhood and exported. Population, 1891, 3,416; 1901, 3,384. C.L.S.

ST MARYS RIVER. See ST. LAWRENCE, Vol. XXI, p. 187; and CANALS, in these Supplements.

ST. MAURICE RIVER. See QUEBEC, Vol. XX, p. 171.

ST. MICHAEL, a post village of Talbot County, eastern Maryland, 22 miles by water S.E. of Annapolis, on a navigable inlet of Chesapeake Bay, and on the Baltimore, Chesapeake and Atlantic railroad. It has a brickyard, sawmill, ship-building industries, and many vessels engaged in the fish and oyster trade. Population 1890, 1,329; 1900, 1,043.

ST. MICHAELS, a station on an island of the same name, in Norton Sound, off the west coast of Alaska, about 60 miles N. of the Aphoon mouth of the Yukon river. It is the principal commercial headquarters for the Yukon and Arctic regions.

ST. MICHAELS. See AZORES, Vol. III, p. 148.

ST. PARIS, a post village in Champaign County, western central Ohio, 11 miles W. of Urbana, and about 50 miles W.N.W. of Columbus, on the Ohio Southern and the Pittsburg, Cincinnati, Chicago and St. Louis railroads. It is situated in an agricultural region, and has a distillery, carriage shops and planing-mills. Population 1900, 1,222.

ST. PAUL, a city, the capital of the state of Minnesota and of the County of Ramsey. (For general article, see ST. PAUL, Vol. XXI, pp. 197, 198.) Built originally upon a series of steep terraces, St. Paul was in earlier years confined by its topography almost entirely to the first and second benches, or terraces, ascending from the river. By 1888, however, the city had spread over the wide and commodious plateaus lying east, west and north of the surrounding bluffs, and now embraces 35,482 acres. Its business center is still confined chiefly to the lower terraces, while the high plateaus that rise above them on every side are the favorite residence districts of the city. In the older portions of the city the streets are too narrow for comfort or beauty, but in the newer the thoroughfares are ample in width and laid out according to modern ideas of usefulness and sightliness. On the western bluff, known as St. Anthony's Hill, are many streets paved with asphaltum and boulevarded, which are singularly handsome and attractive, and chief of these is Summit Avenue, which for a mile or more skirts the brow of the hill overlooking the picturesque Mississippi, and is lined on both sides with handsome residences.

Among the many handsome public buildings are the State capitol; the courthouse and city-hall, completed in 1890 at a cost of little more than one million dollars; the market-house, the Chamber of Commerce building, the United States custom-house, and a union depot. St. Paul's civic transportation facilities are excellent, and the system, many parts of which are continuous with the lines from Minneapolis, has 153 miles of electric and cable street-railway in operation.

The city's assessed valuation in 1901 was: Real estate, $71,067,159; personal property, $15,890,170; the tax levy per $100 being $2.69. The bonded debt (1902) was $8,598,152. St. Paul has a low death rate, being only about 9.60 per 1,000. The city has over thirty public parks or squares, ranging in size from Como Park, with 276 acres of lawn and lake, Phalen Park, Indian mounds, and Shadow Falls Parks, to small breathing-places occupying less than an acre. The civic budget for the year 1902 amounted to $2,779,723, about one-fourth of which ($692,100) was devoted to education. There are efficient fire and police departments, maintained at a combined annual cost of $400,000. The city owns its own water works, acquired in 1882 at a cost of $510,000, or, including subsequent expenditures to date (1902), of over $4,000,000; the annual revenue for which amounts to $342,407.

Eight large bridges cross the Mississippi River at St. Paul. Of the eight now in use, five are for foot-passengers, teams and street-cars, and three for railways. One bridge is a novelty in architecture of this kind, in that, in a length of a little more than half a mile, it has a grade of 100 feet, the southern end being to that extent higher than the northern. The Mississippi has been partially diked on the western bank, and government appropriations are available for a system of levees which will protect many acres of ground from any danger of overflow.

St. Paul is the center of a large railway system, 28 lines radiating therefrom in all directions. There are 14 lines eastward and four to the Pacific Coast, with terminals at San Francisco, Portland, Tacoma, Seattle and Vancouver. During the summer months, the season of greatest travel, about three hundred passenger trains arrive and depart daily from the union depot. These railway transportation facilities, besides the location of the city at the head of navigation on the Mississippi, has made St. Paul an important receiving and distributing point for a vast region, and has brought to it a trade whose volume is constantly increasing.

The churches of the city number about 180, among them being representatives of all the leading denominations. The public schools, which in 1901 numbered 54, including a large manual-training school and several kindergartens, had an enrollment of 25,000 pupils and expended during the year $651,500. The parochial and private schools had an enrollment of 8,000.

The institutions for higher education include Hamline University and Macalester College (both of which, see in these Supplements), St. Paul's Seminary, and St Thomas's Seminary, both Roman Catholic; and Concordia College (German Lutheran). There are numerous benevolent institutions, including homes, relief societies, social settlements and hospitals; and several libraries, among them the Minnesota Historical Society, 25,000 volumes; the Public, 40,000 volumes, and the State Law, 24,700 volumes.

According to the returns for 1900 reports were received from 1,591 manufacturing establishments, having a combined capital investment of $28,208,389, paying $7,669,805 to 17,593 workers and $19,464,570 for materials, from which products were turned out to the value of $38,541,030. Among the most important industries are slaughtering and meat-packing, printing and publishing, the manufacture of foundry and machine-shop products, fur-goods, lumber products, malt liquors, brick and stone.

The growth of St. Paul, like that of its sister city, Minneapolis, has been remarkably rapid. The population, in 1900, numbered 163,065.

ST. PAUL, a post village and the capital of Howard County, southeastern central Nebraska, 22 miles by rail N.N.W. of Grand Island, on the Middle Loup River, and on the Burlington and Missouri River and the Union Pacific railroads. It is surrounded by a farming and stock-raising region, and has large flour-mills. Population 1890, 1,263; 1900, 1,475.

SAINT PETER, an important manufacturing city, the capital of Nicollet County, southern Minnesota, on the west bank of the Minnesota River, 75 miles S.W. of St. Paul, and on the Chicago and Northwestern and the Chicago, St. Paul, Minneapolis and Omaha railways. It is surrounded by timber and prairie land, and has a number of manufactories, including grist-mills, a foundry and a furniture factory. A state insane asylum, erected at a cost of $500,000, is located here. It is the seat of Gustavus Adolphus College, a Lutheran institution organized in 1879 for the education of both men and women. In 1901, it had 21 instructors, 351 students, and a library of 10,000 volumes. Population 1890, 3,671; 1900, 4,302.

ST. PIERRE, a town, on the French island of Martinique, forming one of the Lesser Antilles group of the West India Islands. The island is of volcanic formation, dominated by Mont Pelee, situated near the northern end of the island, some four miles above the town of St. Pierre (pop. between 25 and 30,000). At 8 A. M. on May 8, 1902, Mont Pelee, which had been quiescent for over fifty years, burst forth in a terribly devastating eruption, which, in the brief space of twenty minutes, overwhelmed the town of St. Pierre with torrents of fire and lava, sunk the shipping in the harbor, and calamitously cut off all escape for the town's appalled inhabitants, the whole city and region being at once rendered desolate. The heartrending occurrence evoked the world's sympathies and commiseration and aid on behalf of the islanders. Pop. (1901), 26,011.

ST. REGIS FALLS AND LAKES. St. Regis Falls is a post village of Franklin County, northeastern New York, on the St. Regis River, and on the Northern New York railroad. It has excellent water-power, by means of which lumber-mills are run. Population 1900, 879. At the head of the St. Regis River, in the Adirondacks, are the ST. REGIS LAKES, upper and lower. They are situated in a region noted for its beautiful scenery and much frequented as a summer-resort. Neither of the lakes is large, but they are con-

nected with a network of neighboring lakes, so that one may travel through this region by boat many miles. Near the lower lake is St. Regis Mountain, having an elevation of 1,265 feet above the lake, which itself is 1,623 feet above the sea-level.

ST. ROQUE, CAPE. See ATLANTIC, Vol. III, p. 18.

SAINT-SAËNS, CHARLES CAMILLE, musician; was born in Paris on October 9, 1835, and was educated at the Conservatoire and under Halévy and others. He became organist of the Church of St. Merri in 1853 and of the Madeleine in 1858. He has written numerous operas, sacred dramas, and other musical works, including *La Princesse Jaune* (1872); *Le Timbale Argent* (1877); *Samson et Delilah* (1877); *Étienne Marcel* (1879); *Henry VIII* (1883); *Ascanio* (1890); *Phryne* (1893); *Chœurs d'Antigone* (1893); *Javotte* (1896); *Dejanire* (1898); *Les Barbares* (1901); *Parysatis* (1902); *Helene* (1903), and various others. He has also written many pieces for the organ, piano and orchestra, and is well known as a musical critic. W.F.J.

SAINTSBURY, GEORGE EDWARD BATEMAN, an English literary critic, was born at Southampton, Oct. 23, 1845, and educated at King's College School, London, and Merton College, Oxford. He graduated at the latter in 1868, and for the next ten years was engaged in educational work, filling masterships in Manchester, Guernsey and Elgin, and making a specialty in French and English literature. The subject of French literature he has particularly illuminated for English readers, while he has enriched many eras of English letters by the publication of critical works, full of lucid vigor and learning. His published works embrace a *Primer* (1880), and a *Short History of French Literature* (1882); *Specimens of French Literature, from Villon to Hugo* (1883); an edition of Corneille's *Horace* (1885) for schools; *Dryden*, in the English Men of Letters series; *Marlborough*, in the English Worthies; a *History of Elizabethan Literature* (1887); *Essays in English Literature* [1780–1860] (1891); *Essays on French Novelists* (1890); *Specimens of English Prose Style, from Malory to Macaulay* (1885); *Handbook of Nineteenth Century Literature* (1895); *The Flourishing of Romance and the Rise of Allegory* (1896); and *A Short History of English Literature* (1898). He is also the editor of a volume of *Political Verse* (1890); and a selection of *Seventeenth Century Lyrics* (1891). He contributed forty literary sketches to this ENCYCLOPÆDIA, most of them concerned with French biography, of which CORNEILLE (Vol. VI, pp. 370–373), MONTESQUIEU (Vol. XVI, pp. 808–811), and RABELAIS (Vol. XX, pp. 201–205) are characteristic specimens.

ST. STEPHEN, a town and port of entry in Charlotte County, southwestern New Brunswick, Canada, 116 miles by rail W. of St. John, on the St. Croix river, opposite Calais, Maine, and on the Canadian Pacific and Shore Line railroads. It is the center of a lumbering district, and besides carrying on a large business in shipping lumber, it has a cotton-mill and other manufactures. Population 1891, 2,680; 1901, 2,840.

ST. THOMAS, a town and the capital of Elgin County, southwestern Ontario, Canada, 17 miles S. of London, on the Grand Trunk, the Michigan Central and the London and Port Stanley railways. It is situated in a region devoted to grain and fruit-raising, and is the seat of numerous industries, including saw, grist and flax mills, foundries, tanneries, a block-and-tackle factory, farm-implement works, breweries and others. There are also extensive car-shops of the Michigan Central railroad, employing about five hundred men. Population 1891, 10,366; 1901, 11,485.

ST. UBES. See SETUBAL, Vol. XXI, p. 730.

ST. VINCENT, West Indies, one of the British Windward Islands, in the Lesser Antilles, 22 miles south of St. Lucia, and 90 miles west of Barbados. It is 16 miles long, with a maximum width of 10 miles, and an area of 130 square miles. The interior is mountainous, rising in the volcanic summits of La Souffrière, and the grand Bonhomme, to a height of over 3,500 feet. In the productive belt of low coast land and the fertile valleys, sugar-cane is largely cultivated, and an active export trade is carried on in sugar, molasses, rum, arrowroot, cocoa, and dye woods. Kingstown, the capital, with Georgetown and Caliaqua, are the chief towns. St. Vincent has belonged to England since 1763 when France relinquished its neutral rights. It suffered from eruptions of La Souffrière in 1812 and in 1902, the latter being contemporaneous with the great disaster at St. Pierre (q. v.), Martinique. Population, 1900, 44,633 (mostly colored). C.L.S.

ST. VINCENT, CAPE, the extreme southwest point of Portugal, province of Algarve, in lat. 37° 1′ 15″ N. Noted for the naval battle which occurred off it in 1797 between the English and Spanish fleets. See NELSON, Vol. XVII, p. 331.

SAIVISM. See LAMAISM, Vol. XIV, p. 229.

SAKKARAH. See PYRAMID, Vol. XX, pp. 128, 129.

SALA, GEORGE AUGUSTUS HENRY, journalist; was born in London, of Italian ancestry, on November 24, 1828, and at first studied art. In 1860 he founded the magazine *Temple Bar*, and began a connection with the *Illustrated London News* which lasted for twenty-six years. He was a correspondent of the London *Daily Telegraph* in the American Civil War, in Italy with Garibaldi, in the Franco-German War of 1870, in the Russo-Turkish War of 1877, and in Australia in 1885. He wrote *A Journey Due North* (1859); *Dutch Pictures* (1861); *A Trip to Barbary* (1865); *From Waterloo to the Peninsula* (1866); *Rome and Venice* (1869); *Paris Herself Again* (1879); *America Revisited* (1882); *A Journey Due South* (1885); *Things I Have Seen* (1894), and other works of travel and several novels. He died on December 8, 1895. W.F.J.

SALADIN. See EGYPT, Vol. VII, pp. 653–654.

SALADO RIO, a stream rising in the Andes, in the province of Salta, northwestern Argentine Republic, South America. It flows northeasterly

through the mountains, but on entering the plains turns southeasterly, and after a course of one thousand miles joins the Paraná in the province of Santa Fé. During a part of its course it flows through saline marshes, which impregnate its waters with salt. The river is shallow and unsuited for navigation.

SALAMANCA, New York, a town and village of Cattaraugus County, on the Alleghany River and on the Erie railroad, the Buffalo, Rochester & Pittsburg and the Pennsylvania systems, 61 miles south of Buffalo. Part of the Allegany Indian Reservation with 100 inhabitants is in the town limits which also includes West Salamanca, a village of 483 inhabitants. Good water power promotes the operations of saw and planing mills and an active lumber trade, and other industrial establishments include the car and repair shops of the Erie Company, machine shops, tanneries, etc. Population, 1900, of village, 4,251. C.L.S.

SALAMANDRIDA. See AMPHIBIA, Vol. I, p. 676.

SALANGA OR JUNK CEYLON. See MALAY PENINSULA, Vol. XV, p. 323.

SALAVERRY. See PERU, Vol. XVIII, p. 689.

SALDANHA, OLIVEIRA, a Portuguese chief. See PORTUGAL, Vol. XIX, pp. 568–569.

SALE, GEORGE (1690–1736). See MOHAMMEDANISM, Vol. XVI, p. 628.

SALEM, Illinois, the seat of Marion County, a city on divisions of the Baltimore & Ohio Southwestern, the Chicago & Eastern Illinois and the Illinois Southern railroads, 70 miles east of St. Louis, Mo. It is in a farming and fruit-growing region, and the manufacture of dairy products, the canning of fruits, coal mining and the manufacture of steel bridges are thriving industries. Population, 1890, 1,493; 1900, 1,642. C.L.S.

SALEM, Indiana, the seat of Washington County, a town 93 miles south of Indianapolis, and 40 miles northwest of Louisville, Ky., on the Blue River and on a division of the Chicago, Indianapolis & Louisville railroad. It is the market town of a farming region and has flour and lumber mills, furniture, hub and spoke factories, and stone quarries. Population, 1890, 1,975; 1900, 1,995. C.L.S.

SALEM, a city and the capital of Essex County, northeastern Massachusetts, on the Boston and Maine railroad. The city has a large coasting-trade, and is the landing-place for immense quantities of coal intended for shipment into the interior. The census returns for 1900 showed 37 industries, reporting 446 establishments, having an invested capital of $7,450,935 and a product for the year valued at $12,257,449. Among these the chief are foundries and machine-shops, manufactories of leather, boots and shoes, cotton, white lead, jute, cars and cordage. The city has numerous churches, public, private and parochial schools, seven national banks with combined capital of $2,000,000, two savings banks with deposits aggregating $12,000,000, gas and electric lights, a public library of 35,000 volumes, two daily and three weekly newspapers and a monthly periodical. Population, 1890, 30,801; 1900, 35,956. See also SALEM, Vol. XXI, pp. 220–221.

SALEM, Missouri, the seat of Dent County, a city of Spring Creek township and the terminus of the Cuba & Salem branch line of the St. Louis & San Francisco railroad, 98 miles southwest of St. Louis. It has flour and lumber mills and carries on an active trade in the output of farming, live-stock, and coal-mining interests. Population, 1890, 1,315; 1900, 1,481. C.L.S.

SALEM, New Jersey, the seat of Salem County, a city on Salem Creek 3½ miles from its outlet in the Delaware River, 14 miles southeast of Wilmington, Delaware, and 38 miles southwest of Philadelphia, Pennsylvania, both on the opposite bank of the river and with which Salem has regular steam communication. The city is the terminus of the Elmer and Salem division of the West Jersey & Seashore railroad, and is a busy agricultural and stock-raising center with considerable manufacturing interests, including iron foundries, machinery, glass and oil-cloth works, hosiery mills and tomato-canning factories. See also SALEM, Vol. XXI, p. 221. Population, 1890, 5,516; 1900, 5,811. C.L.S.

SALEM, New York, a town and village of Washington County, 56 miles northeast of Albany, on a division of the Delaware & Hudson railroad. The village is beautifully situated in the valley of White Creek and is a favorite summer resort. Among its educational institutions is Washington Academy founded in 1791. It has agricultural industries and slate quarries. Population, 1900, of village, 1,391. C.L.S.

SALEM, North Carolina, a city of Winston township, Forsyth County, adjoining Winston city, the county seat, the two being usually called WINSTON SALEM. Salem is a well built city of Moravian origin founded in 1766 on a branch of the Yadkin River, and sharing in the railway facilities of Winston which is on two divisions of the Southern railroad and on a division of the Norfolk & Western system, 110 miles west northwest of Raleigh. Salem is the seat of a celebrated Moravian college for women established in 1802. The local industries include the manufacture of textiles, paper, and tobacco. See WINSTON, Vol. XXIX, p. 570. Population of Salem, 1890, 2,711; 1900, 3,642. C.L.S.

SALEM, the largest city of Columbiana County, eastern Ohio, on the Pittsburg, Fort Wayne and Chicago and the Salem railroads, 13 miles E. of Alliance and about 70 miles W. of Pittsburg, Pennsylvania. It is situated in a rich farming country, yielding grain, cattle and wool. Coal is also produced. The city has large manufactories of engines, pumps, wire nails, stoves, organs and labels. Population, 1890, 5,780; 1900, 7,582.

SALEM, Oregon, the capital of the state and the seat of Marion County, a city on the east bank of the Willamette River and on the Portland and Redding (Cal.) division of the Southern Pacific Company railroad, 53 miles south of Portland Passenger and freight steamers ply on the river, con

necting intermediate towns and villages with Portland, and with Astoria at the mouth of the Columbia, and giving navigable communication with Pacific ocean steamer lines. Salem is a noted educational center of the region and among its institutions of learning are the Willamette Methodist University, a co-educational establishment founded in 1843, and the Institute of the Society of Friends, dating from 1892. Asylums for the deaf, dumb, blind, and insane, a penitentiary, and state reform school are also situated here. Salem is the commercial center for the productive agricultural industries of the Willamette valley, and its manufacturing establishments include flouring mills, foundries, breweries, and canneries. See also SALEM, Vol. XXI, p. 221. Population, 1890, 4,515; 1900, 4,258. C.L.S.

SALEM, Virginia, the seat of Roanoke County, a town on the Roanoke River, and on the Norfolk and Bristol division of the Norfolk & Western railroad, 60 miles west of Lynchburg, and 178 miles west of Richmond. Salem is an attractive summer resort on account of its scenic neighborhood and medicinal springs; among its educational institutions is Roanoke College (see page 599 in this volume). It is in a farming and tobacco-growing region, and manufactures machinery, tobacco, cigars, cigarettes, barrel staves and headings, textiles and bricks. Population, 1890, 3,279; 1900, 3,412. C.L.S.

SALE OF INTOXICATING LIQUORS, LAWS REGULATING. See LIQUOR LAWS, in these Supplements.

SALERATUS, a name formerly given to acid potassium carbonate (bicarbonate of potash), and now almost exclusively used for the corresponding sodium salt, extensively used in baking-powders and in medicine.

SALIANS. See FRANKS, Vol. IX, p. 636.

SALICACEÆ. See WILLOW, Vol. XXIV, p. 620.

SALFORD, England, a town of Lancashire, connected with Manchester on the east by several bridges across the Irwell River. It is an independent parish, county and parliamentary borough, although its manufacturing industries and commerce practically form part of Manchester, and share in the railway transport facilities, and in the seaborne advantages of the great ship-canal of its more important neighbor. The largest docks of the ship-canal are on the Salford side of the river; the cotton and other factories bear a fair proportion to the total of the combined establishments of the two towns; Salford cattle market is an important trading center of ancient date; and also notable is Peel Park with the museum and technical schools. (See MANCHESTER, Vols. XV and XXVIII, pp. 467 and 11, also CANAL, Vol. XXVI, p. 45.) Population, 1901, of parish, 105,335; of county borough, 220,957. C.L.S.

SALIDA, Colorado, a city of Chaffee County on the Arkansas River, and on the Denver and Grand Junction division of the Denver & Rio Grande railroad, at the junction of the Monarch and Otto branch lines, 90 miles west of Pueblo. It is an agricultural and silver-mining town, and among its institutions are an academy and an hospital of the Denver & Rio Grande railroad, which has large construction and repair shops here. The Poncha Hot Springs is visited by health seekers. Pop., 1900, 3,722. C.L.S.

SALIENTIA, a name given by certain authors to the order of amphibians which contains the toads and frogs. The term is synonymous with *Anura*, this name being the one commonly applied to the tailless amphibians. It is also equivalent to *Batrachia* in the restricted sense of that term. The name is not often used by recent authors. The name has also been applied to an order of mammals containing the kangaroos and similar forms.

SALINA, Kansas, the seat of Saline County, a city and important railway junction 186 miles west of Kansas City, on Smoky Hill River and on divisions of the Atchison, Topeka & Santa Fé, the Chicago, Rock Island & Pacific, and the Missouri Pacific railroads, and on three divisions of the Union Pacific system. The city is well built and is a winter resort; among its many educational institutions is the Kansas Wesleyan (Methodist Episcopal) University, a co-educational seat of learning established in 1886; its teaching staff comprises 26 instructors and it has an average annual attendance of over 600 students; the Salina Normal University is also situated here. The Smoky Hill River furnishes abundant power for numerous manufacturing establishments which include flouring and lumber mills, baking powder, ice, brine, gypsum, cement and brick works. Population, 1890, 6,149; 1900, 6,074. C.L.S.

SALINAS, California, the seat of Monterey County, a city at the junction of the Pajaro Valley Consolidated railway with the Southern Pacific Company system, 18 miles east of Monterey on the Pacific. Its industries are connected with sugar beet, fruit, stock and wool raising. Population, 1900. 3,722. C.L.S.

SALINEVILLE, a post village of Columbiana County, eastern Ohio, on the Cleveland and Pittsburg railroad, 30 miles S.S.E. of Alliance and about 70 miles W.N.W. of Pittsburg, Pennsylvania. In addition to coal-mining, which is the principal industry, there are flour-mills, potteries, and brick-works. The surrounding country is given largely to agriculture. Population, 1890, 2,369; 1900, 2,353.

SALINOMETER. See HYDROMETER, Vol. XII, p. 573.

SALISBURY, Connecticut, a town of Litchfield County, 64 miles west northwest of Hartford on the Hartford and State Line division of the Central New England railroad. It is picturesquely situated on the Housatonic River near the Great Falls which have a perpendicular drop of 60 feet, affording great water power for numerous manufacturing industries, including flouring, lumber, and wool mills. Near the town are valuable deposits of hematite iron ore which furnish the raw material for blast furnaces, foundries, machine shops and cutleries. Salisbury first set-

tled in 1720, was incorporated in 1741. Population, 1891, 3,420; 1900, 3,489. C.L.S.

SALISBURY, a post village and the capital of Wicomico County, southeastern Maryland, on the navigable Wicomico River, and on the New York, Philadelphia and Norfolk and the Baltimore, Chesapeake and Atlantic railroads, 32 miles N.N.E. of Crisfield. The surrounding district produces grain, fruit and lumber, of which large quantities are exported. The village has an academy, planing-mills and flour-mills. Pop., 1900, 4,277.

SALISBURY, North Carolina, the seat of Rowan County, a city and railway junction of three divisions of the Southern railroad on a branch of the Yadken River, 118 miles west of Raleigh. It is an educational center for colored people, among its institutions being Livingstone College founded in 1879 by the African Methodist Episcopal Church, and a state normal school, also for colored students. In an extensive granite-quarrying, iron-mining, and farming region, its commerce and industries are varied, the factories including the construction and repair shops of the Southern Railroad Company, cotton mills, foundries, etc. Population, 1900, 6,277. C.L.S.

SALISBURY, MARQUIS OF, ROBERT ARTHUR TALBOT GASCOYNE-CECIL, statesman; descendant of the illustrious Burghleys and Cecils of Tudor and Stuart days; was born at Hatfield House, England, on February 3, 1830, and was graduated from Eton in 1847, and from Christ Church, Oxford, in 1849. He was then only Lord Robert Cecil, second son of the Marquis of Salisbury, with "small expectations," so he went to Australia to seek, but did not find, a fortune in the gold mines. Returning home he was made a fellow of All Souls', Oxford, in 1853, and in the same year entered Parliament as a Conservative from Stamford. He made himself a force in the House of Commons, opposing the abolition of church rates in 1858, and supporting Disraeli's reform bill in 1859. He paid especial attention to church, educational, and foreign affairs, and was a particularly studious, sarcastic and effective speaker. He was at this time also a frequent contributor to leading reviews, and even to the editorial page of a London newspaper. In 1865 his elder brother died, and he thus became Viscount Cranborne and heir to the peerage. In that year he vigorously opposed Mr. Gladstone's reform bill, and the next year became Indian secretary in Lord Derby's cabinet, but revolted against the Derby-Disraeli reform bill, and resigned from the cabinet in order to fight against it. The death of his father in 1868 translated him to the House of Lords, where he became one of the Conservative leaders, especially in opposition to the disestablishment of the Irish Church. He was chancellor of the University of Oxford in 1869, supported the Peace Preservation bill, but opposed the Irish Land Act in 1870, and was much concerned with the bill for abolishing religious tests in the universities. He became Indian secretary again in 1874, but soon quarreled with Disraeli, who described him as "a great master of gibes and flouts and jeers," and whom Salisbury in turn distrusted and perhaps despised. He was envoy to the Constantinople Conference of 1876–77, disobeyed and quarreled with Lord Derby, and the next year succeeded Derby as foreign secretary. He was the colleague of Beaconsfield (Disraeli) in the Berlin Conference of 1878. In 1881 he became leader of the Conservative party, then in opposition. When the Gladstone government went out in 1885 he became prime minister and foreign secretary for a short time, and resumed them in 1886, when the new Gladstone government was wrecked on Irish home rule. In 1892 the Liberals won, and he was retired to the Opposition, where he defeated Gladstone's home rule bill in the House of Lords. In the fall of 1895 he again became prime minister, at the head of the Conservative-Liberal Unionist coalition, and had a most eventful administration, dealing with the Armenian massacres and the whole Turkish question, the Venezuela dispute with the United States, the Jameson raid in the Transvaal, and the menacing interference of Germany, the reconquest of the Soudan, and the consequent jealousy of France, the Cretan insurrection, the Greco-Turkish War, and the international complications which it involved, and finally the war in South Africa with the Boer states. In all these and many other matters he showed himself a prudent and masterful statesman. He was essentially a student and an aristocrat. He seemed like one of his ancestors of Elizabethan days transplanted to the nineteenth century. He was an ardent student of science, especially of chemistry and electricity, and as president of the British Association in 1894 delivered a profound philosophic address, which stands among the modern classics of science. He died on August 22, 1903. W.F.J.

MARQUIS OF SALISBURY.

SALIVATION. See MERCURY, Vol. XVI, p. 39.

SALMON, a fish of the genus *Salmo;* is found in all the northern parts of America, Europe and Asia. The natural home of the salmon is about the mouths and estuaries of great rivers, and it cannot be stated as belonging exclusively to either the marine or the fresh-water fishes. Owing — as it is supposed — to the fact that the fish obeys a natural instinct to return, in the spawning-season, to its own birthplace, the salmon annually ascends in the summer to the head of the rivers, where the eggs are deposited in furrows which the female digs in the gravel. After remaining here for some weeks, the salmon, both

male and female, return to the sea. For an extended account of the spawning and the migrations of the salmon, and for the various species, see SALMONIDÆ, Vol. XXI, pp. 235, 236.

The strength of this migratory instinct is so great that scarcely any obstacle, such as rapid and waterfall, prevents the salmon from ascending in vast, almost countless shoals. Salmon have been seen to leap a vertical fall 16 feet in height; and when, at times, the fish falls short by one or two feet of leaping the entire distance, it is able to remain suspended in the falling water and to clear the balance of the space by a switch of its tail. Nothing is known of the life of the salmon in the open sea, but their growth while there is so rapid that they have been known to increase within a few months from a weight of 2 ounces to from 6 to 10 pounds. It has been known to reach over 100 pounds in weight, but the average is not higher than 15 to 25 pounds. In their migrations from the sea to the spawning-grounds the salmon are taken in incredible numbers. A writer, in describing these shoals of salmon in the Fraser River of British Columbia, says: "At certain times the river is almost choked with the salmon forcing their way to the upper waters. They are so numerous that it seems as though one could walk across on their backs."

On the Pacific Coast of America there are five species, which are collectively called "Pacific salmon"; and they form the genus *Oncorhynchus*. One of these, the hump-backed salmon, *O. gorbuscha*, weighs 3 to 6 pounds, and ranges from Alaska to the Sacramento River. Another, the dog-salmon, *O. lagocephalus*, ranges nearly as far south, and reaches 12 pounds in weight. Another, the silver salmon, *O. Kisutch*, attains to 8 pounds, but is of small economic value. The blue-back salmon, *O. lycaodon*, reaches a weight of 8 pounds, and is abundant in the Columbia and its tributaries. It comes from the sea with a beautiful bright-blue back and silvery sides; but the males, when they return toward the ocean, are of a red color, and are called "red-fish" by the river-men. This fish ranks second in value among the Pacific Coast salmon.

The first place is held by the quinnat or king-salmon, *O. quinnat*, the largest, most numerous and most important of the Pacific Coast salmon. It frequently reaches a weight of from 80 to 100 pounds, and enters in large numbers into the Sacramento River, but is far more abundant in the Columbia and the rivers still farther north. About thirty million pounds of salmon have been annually taken in the Columbia River alone. Extensive canneries have been erected along the Columbia and other Pacific Coast rivers, wherein the fish are preserved for shipment. The fish are first cleaned and washed, after which they are placed in vats of salted water, where they are allowed to remain long enough to thoroughly cleanse. Their tails, fins and heads are removed, and they are cut by machinery to the exact necessary size to fill the cans. The cans are filled with the raw fish, along with the brine; after which the cans are soldered up and lowered by machinery into steam-boilers at a temperature of 240°, where they are cooked for an hour. After removal a hole is punched in each can to allow gas to escape, after which it is quickly soldered again. The cans are then subjected to a second cooking, after which a spray of cold water is thrown over them. If the can is swollen it is rejected; if the sides hollow in as it cools, it shows that a vacuum exists and the can is perfect. Columbia salmon are exported to all parts of the world.

As the fish run up-stream they are taken in seine and pound nets, gill-nets, various trap-contrivances and fishing-wheels. (The seine-net is described under the head of *Trawl*, in the article on FISHERIES, Vol. IX, pp. 214–218.)

Pound-nets are arranged with a long, straight stretch of upright net for a leader, by which the fish are guided at length into a sort of pound or net inclosed on all sides, where they keep swimming around always in the same direction without being able to find the exit. The gill-net is a net with large meshes, which admit only the heads of fish of a certain size. In trying to pass through the meshes the fish are caught and held by the gills. Both these nets, as well as the fyke-net (somewhat similar to the pound-net), are set in the water by driven stakes. One of the most ingenious devices is the fishing-wheel. Only rivers with swift currents are available for its use, but in the Columbia and other Pacific Coast streams it is most effective. It consists of a large water-wheel of the under-shot pattern, provided with large wire scoop-nets which face down-stream. These wire baskets seize the fish as they come swimming up-stream; the revolving wheel lifts them from the water and tumbles them out upon an inclined chute, through which they slide into a receptacle. The total Pacific Coast salmon fisheries in 1889 reached 110,913,702 pounds, with a value of $3,458,006, of which California, Oregon and Washington provided nearly three fourths, and Alaska the balance. Besides this, the Fraser and other British Columbian streams furnish an enormous supply, which, taken altogether, threatens to extinguish the supply within a short time unless the United States Fish Commission shall succeed in replenishing the rivers through its strenuous efforts at restocking them by artificial means. For a description of the methods of artificial propagation of salmon and other fishes, see PISCICULTURE, Vol. XIX, pp. 135–138. For the *Game-Fishing* of salmon, see ANGLING, Vol. II, pp. 36–37.

SALMON, GEORGE, theologian and mathematician; was born in Dublin, Ireland, on September 25, 1819, and was graduated from Trinity College in 1839. He became a fellow of Trinity in 1841, regius professor of divinity in 1866, and provost in 1888, becoming also a fellow of the Royal Society and the recipient of many honorary degrees. His mathematical writings comprise *Analytic Geometry; Modern Higher Geometry; Conic Sections; The Higher Plane Curves*, and *Geometry*

of Three Dimensions. In theology he wrote *College Sermons* (1861); *The Reign of Law* (1873); *Non-Miraculous Christianity* (1881); *Gnosticism and Agnosticism* (1887); *An Introduction to the New Testament* (1888), and *The Infallibility of the Church* (1888). He died in January, 1904. W.F.J.

SALMONEUS, King of Elis. See GUNPOWDER, Vol. XI, p. 282.

SALMON-TROUT. See SALMONIDÆ, Vol. XXI, p. 232.

SALOL, a drug of comparatively recent introduction into the pharmacopeia. It is a compound, white, crystal (C^{13} H^{10} O^3), obtained from salicylic and carbolic acids in the proportion of six to four; is a substitute for salicyclic acid; acts internally as an antiseptic; used sometimes in rheumatism, cholera and fermentive troubles of the alimentary canal.

SALONA. See SPALATO, Vol. XXII, p. 380.

SALPAIDÆ. See TUNICATA, Vol. XXIII, p. 655.

SALSAFY, OYSTER-PLANT OR VEGETABLE OYSTER. See HORTICULTURE, Vol. XII, p. 300.

SALT. (For general article on salt, its manufacture, and various uses, see SALT, Vol. XXI, pp. 239–246.) In the United States there is almost an inexhaustible supply of salt, most of which is taken from salt springs, while many places on the coast offer facilities for its production. The product in 1900 was 15,187,819 barrels (280 lbs to 1 barrel). The bulk of this was from subterranean brines; and the remainder from lakes or natural deposits, and from seas or bays. Salt is produced in fifteen states, but about sixty-seven per cent of the whole product comes from Michigan and New York, as can be seen from the following table, which is compiled from the census of 1900:

UNITED STATES AND TERRITORIES.	AMOUNT OF SALT MANUFACTURED.	PERCENTAGE OF TOTAL PRODUCT.
	Barrels.	
United States	15,187,819	100.0
Michigan	5,206,510	34.3
New York	4,894,852	32.2
Kansas	1,645,350	10.8
Ohio	1,460,516	9.6
Utah	235,671	1.5
West Virginia	221,534	1.5
California	640,420	4.2
Texas	312,436	2.1
All others*	570,530	5.4

The reason that more salt is not produced in the United States is chiefly because of the great amount and cheapness of production of the article in England, and because large quantities are brought over in vessels as ballast. The principal expense in salt manufacture is the cost of fuel, and this furnishes one reason why Michigan takes first rank as a salt-producing state. For, aside from the excellent quality of the brine, they are able to secure cheap fuel by using saw-dust and other refuse from saw-mills, including the exhaust steam. The principal wells in this state are near Saginaw Bay.

*Illinois, Kentucky, Louisiana, Massachusetts, Nevada, Virginia, Pennsylvania, and Oklahoma.

In Nevada, salt is chiefly obtained from salt lakes, while in Arizona there is one lake which dries up each year and leaves a remarkably fine deposit of salt, which settlers haul away in wagons.

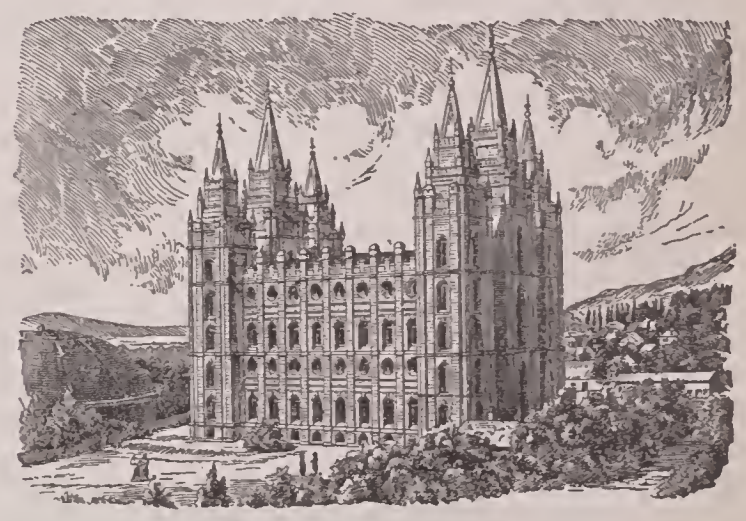
Salt wells average in depth from 1,000 to 1,900 feet.

Rock-salt is mined in four states, but the quantity produced is relatively unimportant, although it increased from 312,000 bushels in 1880 to 7,066,000 in 1890. The most important mine is on Avery's Island, in the Gulf of Mexico, where about one million bushels were produced in 1890.

SALT CREEK OR RIVER, a stream in northern Kentucky, noted for its tortuous, winding course. After flowing about 150 miles it joins the Ohio, 17 miles S.W. of Louisville. The derivation of the phrase "sent up Salt River" or "rowed up Salt River," as applied to a defeated political party, has been variously explained, one of the best explanations placing the origin of the phrase in 1832, when Henry Clay, candidate for President, having an engagement to speak in Louisville, Kentucky, hired a boatman, who turned out to be a Jacksonian Democrat, to row him up the Ohio River. The boatman, pretending to lose his way, rowed Clay up Salt River instead, so that the latter did not reach his destination till the next day—just in time to hear of his defeat.

SALT LAKE. See UTAH, Vol. XXIV, p. 25.

SALT LAKE CITY, a city of Utah. Salt Lake City in 1890 was the center of five railroads, the Great Salt Lake and Hot Springs, the Rio Grande Western, the Salt Lake and Los Angeles, the Union Pacific and the Utah Central. Since 1880 two notable buildings have been completed: the city and county building, completed in 1894 at a cost of $900,000, and the Great Temple, a massive structure of granite, 40 years in course of construction, estimated to have cost not far from $12,000,000, completed April 6, 1892, and formally dedicated just one year later, on the sixty-third anniversary of the organization of the Mormon church. The Temple is one of a group of buildings, including the assembly hall and tabernacle, occupying a tract of ten acres in the heart of the



MORMON TEMPLE, SALT LAKE CITY.

city, and the building from beginning to end was the work of Mormons. It has an extreme length of 186½ feet, a width of 99 feet, and with the towers covers an area of 21,850 square feet. The loftiest tower is 222 feet 6 inches high, 26 feet square at the base, and is surmounted by a statue, 12 feet in height, of the angel Maroni. The figure is of hammered copper, plated with gold leaf. The first and second floors of the building contain the ceremonial rooms of the Mormon church, and the upper floor contains an assembly-room with a seating capacity of about three thousand.

The growth of the city since 1880 has been rapid, and since that time the strength of the non-Mormons, or Gentiles, has steadily increased, until in 1890 they gained control of the municipal government. The city is the center of mining interests for Utah and the neighboring states, and is the trade and shipping-center of a region made rich in agricultural production by irrigation. The returns of 1900 showed 432 industries, capitalized at $4,048,906, and having a product valued at $6,109,409. Among these industries the chief are planing, paper, flour and woolen mills, foundries and machine-shops, tannery, breweries, sampling-mills and smelting-works. The city has gas and electric lights, is traversed by horse-car lines and electric street-railways, contains churches representing the leading denominations; has good public schools, several libraries, 4 daily, 3 semiweekly, 10 weekly, 2 semimonthly and 5 monthly periodicals. The assessed valuation of city property in 1899 was $65,000,000, and the tax-rate 6½ mills. Salt Lake City is the seat of the University of Utah (non-sectarian), a co-educational institution, supported by the state, and in 1893 granted by Congress the Fort Douglas reservation as a site for buildings. The university, which was founded in 1850, had in 1900–01 28 instructors, 643 students, and a library of 20,000 volumes. Population 1880, 20,768; 1890, 44,843; 1900, 53,531. See also SALT LAKE CITY, Vol. XXI, p. 247.

SALTO OR SALTO ORIENTAL, Uruguay, the capital of the department of Salto, a town and port at the foot of the rapids of the Uruguay River, and at the head of steamer navigation, opposite Concordia in the Argentine Republic, 260 miles by rail northwest of Montevideo, and 285 miles by river north of Buenos Ayres. It exports precious gems, and the farm and animal products of a fertile agricultural and stock-raising region. Population 14,000. C.L.S.

SALTONSTALL, GURDON, an American public man; born in Haverhill, Mass., March 27, 1666. He graduated at Harvard in 1684, and was ordained in New London in 1691. On the death of Gov. Fitz John Winthrop, he was elected to fill the unexpired term, and was subsequently annually elected governor for 16 years. He was influential in forming the Saybrook Platform, and in the establishment of Yale College at New Haven. He died in New London, Conn., Sept. 20, 1724. E.E.T.

SALTONSTALL, LEVERETT, an American public man; born in Haverhill, Mass., June 13, 1783. He graduated at Harvard College in 1802; studied law, and began practice at Salem in 1805. He was a member of the State Senate in 1831; mayor of Salem, 1836–38; a Presidential Elector in 1837; Representative in Congress from Massachusetts, from Dec. 5, 1838, to March 3, 1843. He died in Salem, May 8, 1845. E.E.T.

SALTONSTALL, RICHARD, an American jurist; born in Haverhill, Mass., June 14, 1703. He graduated at Harvard College in 1722, and represented Haverhill in the General Court in 1728. In 1736 he was appointed a judge of the Superior Court. He was chairman of the commission for settling the boundary line between Massachusetts and New Hampshire in 1737. He died Oct. 20, 1756. E.E.T.

SALTONSTALL, SIR RICHARD, an American pioneer; born in Halifax, England, in 1586. He came over with Gov. Winthrop in 1630, and was an Assistant in that year. He was instrumental in the settlement of Watertown, Mass., but became discouraged and returned to England in 1631. In 1651 he wrote a letter of reproof to Cotton and Wilson, for their tyranny in whipping and imprisoning in matters of conscience. He died in England about 1658. E.E.T.

SALT RANGE OR KALABAGH MOUNTAINS. See PUNJAB, Vol. XX, p. 113.

SALT RHEUM, a vague and popular term in the United States, applied to all non-febrile cutaneous affections except ringworm and itch, especially of the eczematous and herpetic forms. The term is not now used by physicians, nor is it found in modern medical dictionaries. See SKIN DISEASES, Vol. XXII, pp. 130, 131.

SALTS. See CHEMISTRY, Vol. V, pp. 421, 422.

SALTUS, EDGAR EVERTSON, an American author; born in New York, June 8, 1858. He was educated at St. Paul's School, Concord, N. H., at the Sorbonne, Paris, and in Heidelberg and Munich, Germany; and graduated at the Columbia College Law School in 1880. He has devoted himself entirely to literary work, is well known as a novelist, and is the author of *Balzac: A Study; The Philosophy of Disenchantment; The Anatomy of Negation; Mr. Incoul's Misadventure; The Truth About Tristram Varick; Eden; Mary Magdalen; Imperial Purple; A Transaction in Hearts; When Dreams Come True; The Pace That Kills.* E.E.T.

EDGAR E. SALTUS.

SALTUS, FRANCIS SALTUS, poet; was born in New York city on June 12, 1850, and was educated chiefly in Europe. He was a precocious scholar, and began publishing poems in 1873. He was a prolific writer of poems in all conceivable keys, from the most solemn and stately to the

most whimsical and rollicking. Under the pen-name of "Cupid Jones" he wrote much for the press. He published several volumes of poems, a monumental *Life of Donizetti*, monographs on Rossini, Bellini and other composers, numerous short stories and other works. He composed two operas, *Mary Stuart* and *Joan of Arc*, and several operettas, and hundreds of songs and minor pieces. He died on June 25, 1889. W.F.J.

SALVADOR, REPUBLIC OF. (For general article, see SALVADOR, Vol. XXI, p. 281.) The area of the republic is estimated at 7,225 English square miles, divided into 14 departments. The population according to a census of Mar., 1901, was 1,006,848, giving an average of 139 inhabitants to the square mile, being twenty times that of the average of the other states of Central America. Aboriginal and mixed races constitute the bulk of the population, among whom live about 20,000 whites, or descendants of Europeans. The capital is San Salvador, founded in 1528, with 59,540 inhabitants in 1901. The city has often been destroyed by earthquakes and volcanic eruptions, the last time on April 16, 1854, when it was overwhelmed by almost total ruin, in consequence of which most of the inhabitants erected new dwellings on a neighboring site, at present called Nueva San Salvador. The new capital again was partly destroyed in 1873 by a series of earthquakes and eruptions, and suffered again severely in 1879.

GOVERNMENT. The constitution proclaimed in 1864, and modified in 1880, 1883, and 1886, vests the legislative power in a Congress of 70 deputies, 42 of whom are proprietors. Election is for one year, and suffrage is universal. The executive power is in the hands of a President, whose tenure of office is limited to four years, and who is assisted by a ministry of four members. In 1895 the republics of Honduras, Nicaragua, and Salvador united to form the greater republic of Central America, to be known as the Republic of Central America when Guatemala and Costa Rica accepted the agreement. The governments signing did not renounce their autonomy and independence in internal affairs. In 1898 the attempt to give practical effect to the agreement failed, and the federation was dissolved.

EDUCATION AND JUSTICE. Education is free and obligatory. In 1893 there were in Salvador 585 primary schools, with 29,427 pupils; 18 higher schools (including two normal and one polytechnic school), with 1,293 pupils; and a national university with faculties of jurisprudence, medicine, natural sciences, and engineering, attended by 180 students. In the capital is a national library and museum, and in the republic 28 newspapers are published. Justice is administered by the supreme court of justice, by several subordinate courts, and by local justices.

INDUSTRY. The population are largely employed in agriculture, and produce chiefly coffee, indigo, sugar, and tobacco. But they also produce gold, silver, copper, iron, mercury, and coal. The following shows the state of commerce:

	1890.	1896.
Imports subject to duty	$2,405,202	$3,347,718
Exports	7,578,734	7,485,384

In 1896, 338 vessels entered the ports. In 1898 there were about 73 miles of railway. The republic has been a member of the Postal Union since 1879. In 1896 there were 121 telegraph stations and 18 telephone stations.

FINANCE. The revenue, largely from custom and excise duties, and expenditure are shown by the following table:

	1890.	1894.	1900.
Revenue	$4,151,457	$8,818,000	$6,293,462
Expenditure	5,442,315	8,369,000	6,794,874

The national debt, internal, was in 1896 placed at about $9,250,000. The foreign debt (1899) was 3½ million dollars. The country has been on a gold standard since Aug., 1897; and the unit piece is the dollar, worth about 72 cents in United States money. The metric system was introduced in 1885.

SALVATION. See PAUL, Vol. XVIII, pp. 435–437; and BUDDHISM, Vol. IV, pp. 383–384.

SALVATION ARMY, a religious missionary organization that began in 1865, in London. It was founded by William Booth (q.v., in these Supplements) and his wife, who started out from the Methodist New Connection to reclaim the neglected and degraded. They organized their work in the east end of London, and named it the "Christian Mission." He had found small encouragement for his evangelism in the churches, and the usual methods of revivals, committees, conferences and organizations seemed to fail of their purpose until the military idea was, to use his phrase, revealed to him. Working on the lines of Primitive Methodists, Booth gathered about him many earnest converts, drawing some of them from gin-palaces and the haunts of extreme depravity. The work made friends among the upper and middle classes, who became, in particular, supporters of Mrs. Booth. It was in 1878 that the mission was reorganized on its military model, and with Mr. Booth designated as general, it took the name of "Salvation Army." This expedient attracted immediate attention, and some applauded while others opposed. The army had to fight its way to peaceable recognition, for its street meetings, both in European and American cities, were broken up at times by the police and the leaders put in jail or fined; although nowhere was this sort of opposition protracted.

While the fatigue uniforms of the men, the blue blouses, poke-bonnets with red trimmings of the women, the street parades with banners and the sound of timbrels, drums and songs on the highways arrested passers-by and drew crowds to hear the preacher, there was a deeper significance in the military system. The absolute authority of the general and the required subordination of his officers and the rank and file of the army have

brought to it the efficiency of disciplined organization. Perhaps here, too, will be found the most serious menace to the perpetuity of the mission. How long the will of the commander-in-chief will be respected as to questions of faith, as well as to the control of the soldier's service, remains to be seen; but from the beginning all authority has been his.

In doctrine the army holds to the simplest tenets of evangelicism, and is more mystical than dogmatic. It holds that the work of Jesus is the sole and universal expiation of sin; that its virtue is appropriated by faith; that the Bible is a book of plenary inspiration needing no glasses, and having its best interpretation by simple and godly hearts; that sanctification may be fully received by the believer by faith, and consciously; that religion issues in a pure and self-denying life. Sacraments there are none, yet there is nothing to hinder a soldier of the army from seeking them elsewhere, although membership in churches is not encouraged—rather, the reverse, it is gently discouraged. Infants are publicly dedicated to God and the army; marriages are public contracts, solemnized, where the law of the land permits, "under the flag," each pledging the one not to hinder the other in the service of the army. Admission to the army comes with signing "the articles of war," which involves a profession of love to God and faith in Christ, and promises to live for God and the army and to obey all lawful orders. It is this solidarity of organization with its constantly stimulated *esprit de corps*, that makes safe a large degree of freedom in thought and spiritual life that the soldier enjoys, but everywhere loyalty, devotion to the service, enthusiasm, glad obedience are expected, and also obtained to a remarkable degree. Service is voluntary, and one may withdraw from it at pleasure. There is no pay regulation, and those who give all their time are guaranteed only enough for a frugal support.

In the army, sex is allowed to work no distinction of rank, duty or opportunity. "There is neither male nor female, for ye are all one in Christ Jesus." The women exhort, lead meetings, parade, explore slums, sell the *War Cry* on street or in rum-shops, hold rank from corporal to commander of a country—and the men can do no more. Neither is the least preference shown to them. Each does that that each can do best. All are to engage in working for the salvation of sinners, so long as there is one living unreclaimed.

The characteristic dress is not uniform, but has adaptations to the customs of a country. It is the same in Great Britain and the United States. In India it is a white garment, patterned there, as everywhere, after the costume of the common people.

Barracks is the name of the place where meetings are held, and it is no small part of parades and street demonstrations to induce people to follow to the barracks. These places are generally hired rooms in populous but obscure parts of the city, and in truth, thus far, most of the work of the army is done in cities, although it has horseback brigades for use in rural districts.

The society is intensely religious and evangelizing, and its distribution follows this conception. In its grand propaganda it divides the world into its military jurisdiction. Each country is mapped out into districts under the care of an officer, usually called a major. His subordinates are captains and lieutenants, in charge of cities and towns. Large divisions are of higher commanding grade.

The property of the society is entered on a deed-roll, under the control of the general of the army, though he is credited with never drawing his income from it. Indeed, the people who compose the army are generally humble people, though they have the same sympathy that was given in the middle ages to the Franciscans. The income is derived from sales of publications, from contributions made at barrack-meetings, from friends, from an annual day of abstinence, corresponding to Lent, and from what may come from associates of the army, who are organized into a subsidiary corps.

In 1880 the army opened its operations in France. The same year it sent six "Hallelujah Lasses" to Castle Garden, in New York, who went thence to Harry Hill's slum, on the East Side, under the direction of G. S. Riallton. This scheme was reinforced the next year by the expedition of Major T. E. Moore, who began his work in Philadelphia. In 1883 he secured an act of incorporation for the society, and thus prepared the way for a separation, under Ballington Booth, of an American branch, "The Volunteers," from the parent society. Moore was succeeded first by F. Smith, and in 1887 by Ballington Booth, who married Maud Charlesworth, and who was born about 1858, and had been a principal of a London training-school, an inspector of the army around the world. In 1896 he separated from the parent society, for reasons not yet made plain, to organize "The Volunteers." It is understood that he wished a greater freedom of movement, corresponding to the democratic organization of American society, more local self-control and a less social restriction to classes.

At the time of this first separation the Booth family, either by direct descent or by marriage, stood in the following relation to the army: "Commander and Mrs. Booth-Tucker succeeded to the oversight of the army in this country. Commander Booth-Tucker was formerly a magistrate in her Majesty's service in India, and is a man of considerable experience with the natives of that country. His wife, Emma Booth-Tucker, is the second daughter of General Booth, and is a woman possessed of some platform ability and considerable experience in army work. The rest of General Booth's family are: William Bramwell, the eldest son, who assists his father and is the chief executive in London; Herbert Howard, the third son, who is in command of Australia;

Catherine, the eldest daughter, in charge of the work in Belgium; Eva, the third daughter, in Canada; and the youngest daughter, Lucy, in France."

At the time of this separation from the old movement the disposition of forces was as follows in the United States: Five hundred and thirty-two corps, 2,011 officers, 17,269 soldiers, 3,262 recruits, 6 rescue homes, 25 training-garrisons, 3 food and shelter depots; *War Cry* (weekly organ), a combined circulation of 75,000 copies; *Conqueror* (monthly magazine), 15,000 copies. The army had found employment during the year for 9,803 persons.

The recruits for the army are from all conditions of life, and innumerable converts are not qualified to teach or exhort. For these there are over forty training-schools scattered through the jurisdiction. Other institutions, to promote emigration, to reform debased converts, thriftless from the slums, and to deal with the whole problem of outcasts, grew out of General Booth's book, *In Darkest England, and the Way Out* (1890). Large sums were intrusted to him to carry out his schemes, none of which have been sufficiently tried to enable one to form a judgment of their social value.

The army has spread its operations over Great Britain, France, Switzerland, Sweden, Canada, Australia, New Zealand, Tasmania, India, Ceylon, South Africa, Germany and the United States. Wherever it goes it conforms to the conditions that confront it, save in its evangel of salvation through Jesus Christ. It conforms in costume, in adjustments to suit the high and the lowly, in every way that will secure a hearing. It would be all things to all men in an apostolic sense, and it believes itself in possession of apostolic equipments and methods.

In 1904 there were 16,020 officers, composed of men and women whose lives were entirely given to the work; 7,585 corps or societies, operating in 49 countries and colonies in 34 languages. There were some 2,098,631 meetings held annually, outdoors and in. The number of periodicals printed or published was 58, with a combined circulation of over a million. The annual rental-roll was over $1,000,000. The amount of property owned by this organization exceeded $4,000,000, and the annual income was $3,645,000. The United States division of the Salvation Army had in 1900, 2,125 officers, 654 corps or societies, 16 slum posts, 6 rescue homes, 5 food and shelter depots. The organization also has in the United States, cavalry brigades, out-riders' circuits, maternity homes, labor bureaus, women's shelters, and an inquiry department, which looks up missing friends and relatives. They publish the *War Cry*, one edition in New York City and another on the Pacific Coast; a Swedish and also a German edition in New York City, with a combined circulation of 90,000; *The Young Soldier*, weekly circulation 35,000; and *The Conqueror*, monthly, 16,000.

The following is a statement in detail of the distribution of the Salvation Army in the world:

Countries.	Corps or Societies.	Officers.
United Kingdom	1,338	4,306
Australia	831	1,527
United States	730	2,577
France and Switzerland	219	435
Sweden	203	658
Canada	355	809
New Zealand	188	313
India	188	555
Holland	63	312
Denmark	72	257
Jamaica	42	83
Norway	65	253
Germany	21	64
Belgium	14	36
Finland	19	61
Argentine Republic	10	41
South Africa	55	187
Italy	8	28
Total (1900)	7,300	15,300

D. O. Kellogg.

SALVIA or SAGE, an herb. See Horticulture, Vol. XII, pp. 259, 273.

SALVINI, Tommaso, an Italian tragedian; born in Milan, in 1830. His father, being a professor of literature, gave him an excellent education. He was at first connected with the royal theater at Naples, and afterward played for six years with another troupe in several Italian theaters. For some time he played with Madame Ristori. His greatest success was at Florence, in 1865, on the 600th anniversary of Dante's birth, when he played the part of "Lancelotto" in the tragedy *Francesca di Rimini*, Madame Ristori playing "Francesca." Salvini played his rôle with such astonishing force as to attract marked attention to himself. The grateful city of Florence presented him with a statuette of Dante. In 1875 Salvini visited the United States, and again in 1881. His chief parts were Othello, Hamlet, Saul, and Orosmanes. His personation of Othello especially was received with great enthusiasm. The elements of his success are his splendid physique, noble bearing, perfect elocution, dramatic power and vehement passion. When in 1868 he performed at Madrid in *La Morte Civile*, the audience, carried away with the intense realism of the death he enacted before them, rushed upon the stage to see if the actor was yet alive. Salvini's last appearance in England was in 1884. He received the honor of knighthood from King Victor Emmanuel.—His son, Alexander Salvini, followed in his father's footsteps, and obtained measurable success in the *Three Guardsmen*, and other plays. He starred in the United States. He died Dec. 15, 1896.

TOMMASO SALVINI.

SAMANA BAY. See Hayti, XI. p. 485

SAMARIUM, a new element found in samarskite, the molecular weight of whose oxide is less than 117. It was first discovered by M. Delafontaine in 1878, but not verified until by M. Lecoq in 1881. It is regarded identical with the $\beta\beta$ described by Marignac.

SAMBRE, a river of France and Belgium, the principal affluent of the Meuse; navigable for barges the greater part of its course; rises in the French department Aisne; flows northeasterly between the valleys of the Scheldt and Oise, through the Belgian provinces of Hainault and Namur, and in the latter province joins the Meuse after pursuing a total course of 100 miles. The Sambre is connected by canals with the Senne and Scheldt in Belgium, and with the Oise in France; its basin produces large quantities of coal.

SAMOA. For general article on this group of 14 volcanic islands in the South Pacific, see NAVIGATORS' ISLANDS, Vol. XVII, p. 287. The total area of the group is about 1,700 square miles; population 1874, 34,265, 16,568 being in Upolu, 12,530 in Savaii, and 3,806 in Tutuila. Savaii and Upolu belong to Germany, and Tutuila, with its fine harbor, to the United States. Population 1906, 37,278. The natives are Polynesians, and there are about three hundred whites. Chief exports are cocoanuts, sugar, copra, cotton and coffee. The commerce of the German islands was in 1902 about $100,000; the German seat of government is Apia. The total imports of the islands in 1900 amounted to $524,000, the exports to $443,000.

At a Samoan conference at Berlin in 1889, of representatives of Great Britain, Germany and the United States, an act was signed (June 14th) guaranteeing the neutrality of the islands, in which the citizens of the three signatory powers have equal rights of residence, trade and personal protection. The three powers recognize the independence of the Samoan government and the right of the natives to elect their chief or king, and to choose their own form of government. A court is established, consisting of one judge, who shall be styled chief justice of Samoa. This court has jurisdiction in (1) all civil suits concerning real property; (2) all civil suits between natives and foreigners or between foreigners of different nationalities; (3) all crimes and offenses committed by natives against foreigners, or committed by such foreigners as are not subject to any consular jurisdiction.

All future alienation of lands is prohibited, with certain specified exceptions. The land commission under the treaty found the claims of foreigners amounted to more than 700,000 acres more than the island contained. In 1894 it allowed German claims to the extent of 75,000 acres, British 36,000, and American 21,000. Revenues arise from customs and taxes, paid chiefly by foreigners, no attempt being made to collect the small capitation-tax from natives. A local administration is provided for the municipal district of Apia.

As a result of the conference, the United States Congress appropriated $100,000 to establish a coaling station at the port of Pago-Pago, and a half million dollars to enable this country to carry out its treaty obligations with Samoa and to uphold and protect American rights in those islands. The American system of money was adopted, but English money is commonly used.

In consequence of the native troubles and the international jealousies, several warships assembled at Apia early in 1889. The United States was represented by the *Vandalia*, *Nipsic*, and *Trenton;* Germany by the *Eber*, *Olga*, and *Adler;* and Great Britain by the *Calliope*. On the night of the 15th of March a hurricane arose that was almost unprecedented in its fury. A chain of coral reefs, having but one opening through which vessels can pass, makes, with a horseshoe-shaped indentation of the shore, the harbor of Apia. Within the enclosed space, about a mile in circumference, were anchored the seven warships mentioned, together with several schooners, a large iron merchant-vessel, and smaller coasting craft. Forewarned by the falling barometer, the ships made preparations to encounter the coming storm, extra anchors being carried out, top-hamper sent down, and steam gotten up. The storm was, however, of such severity that the ordinary resources of seamanship availed little. Anchors dragged despite the utmost efforts of the screws to hold the ships up to their moorings, collisions were frequent, and the scenes of wreck and death were appalling. The *Eber* first struck the reef on the western side of the bay and turned bottom up, seventy-one of her crew being drowned, while five were saved by the islanders, who throughout the storm exhibited great bravery, forming living chains to rescue those who were tossing in the giant surf. The *Nipsic*, after colliding with the *Eber*, sinking a schooner, and being rammed by the *Olga*, was skilfully beached, all her crew but seven being saved by the Samoans. The *Adler*, drifting broadside on to the reef, was suddenly lifted by a tremendous wave, and flung bodily on her side upon the rocks. Twenty out of her crew of 130 were drowned, the rest finding shelter on the vessel, which made a lee for the survivors to secure a hold until rescued. The *Vandalia*, after having been in collision with the *Calliope*, was beached, but her crew were gradually washed away till forty-four had been drowned, the rest being saved by the *Trenton*, which drifted down to the wreck. The *Olga* collided with nearly every other vessel in the harbor, but was ultimately beached without the loss of a man. The *Trenton*, the American flagship, lost her rudder, and was flooded through her hawse-holes, the fires being extinguished and the ship rendered helpless. She drifted around for over seven hours, at one time keeping from the reef by the expedient of sending the crew into the mizzen rigging, thus forming a human sail and wearing off. About noon on the 16th the *Calliope* slowly forged her way past the *Trenton* and through the opening in the reef out to sea. As she passed the American flagship within speaking distance, the crew of the latter gave the British ship a tremendous cheer.—a token of applause for skilful seamanship

and of an amity between the two navies that has been manifested on other occasions. The loss on board the *Trenton* was only one man, but she was so strained and wrecked that she was abandoned. The merchant-vessels in the harbor—some fifteen in number—were sunk or stranded. The *Olga* and *Nipsic* were afterwards floated; the *Calliope* escaped both loss of life and serious injury.

Cocoa plantations were begun in 1892. More than half of the ships that enter and clear at the port of Apia are British, but on the other hand the imports carried in German vessels are of greater value than those carried in British or American. There is now regular steam communication with San Francisco, Auckland, and Sydney.

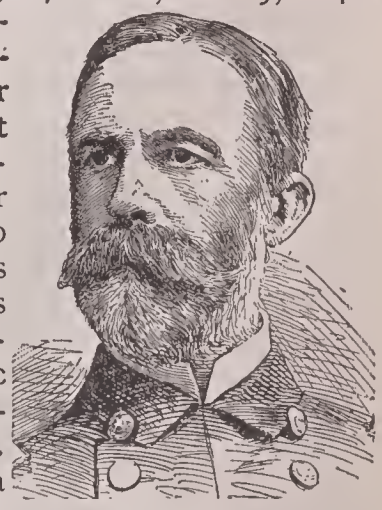
Sudden interest in this remote quarter of the globe has recently been excited by news of a renewed outbreak at Apia among the factions of the rival monarchs for the throne, incited by European intrigue. Robert Louis Stevenson's *Eight Years of Trouble in Samoa* tells us a little of the chronic disaffection among the Samoan tribes. The strife had its origin in the rivalry of two claimants for the Samoan crown, the partisans of both rejecting interference by the European residents and choosing Mataafa as their king. This native action was particularly resented by the German element on the chief island of the group, and to promote peace and security a tripartite treaty was negotiated April 19, 1890, under which government has since been maintained jointly by the United States, Germany, and Great Britain. The treaty prohibited the sale of arms and ammunition and the trade in liquor between foreigners and the natives. On Aug. 22, 1898, the ruling king, Malietoa, died, and the natives thrust Mataafa forward as his successor. For some reason, however, this potentate was deemed ineligible by the American chief justice, who, by the treaty, was empowered to decide questions of disputed succession, and Mataafa was supplanted by the deceased ruler's nephew, Malietoa Tanus. This deposition was naturally not agreeable to the natives, who clung to Mataafa, and were encouraged in their predilection by the German consul and his resident countrymen. In support of the native choice there was an ominous demonstration, and the American chief justice had to fly the scene, whereupon the German president of the Municipal Court of the international port of Apia usurped the post. To this action the British and American consuls objected, as being a violation of the treaty, and with the aid of a body of marines they regained possession of the court and expelled the German nominee and his adherents.

The career of Mataafa has been unusually checkered. He has been the trusted viceroy of an exiled king, then his avenger, defeating and driving out the usurper, Tamasese, who had been supported by German influence against the reigning Malietoa, and incidentally defeating and slaughtering a body of German marines who attempted his capture. Elected king by the principal chiefs, he proposed to surrender his position to the original sovereign, Malietoa, on his return from exile. The later, however, proposed to take the office of vice-king himself, leaving the popular chief to administer the native government. Germany refused to recognize Mataafa, so he withdrew to his own district of Malie, and there set up a local government, which, although conducted peaceably, ignored the arrangements made by the treaty Powers. The native kingship was afterwards abolished.

An adjustment of the international differences at length came about in 1899, as the result of the deliberations in Samoa of a commission appointed by the three interested Powers. The adjustment took the form of an amicable partition of the islands between Germany and the United States, England withdrawing, and receiving compensation from Germany for renouncing her own claims. The settlement, which took place Nov. 8, 1899, gave to Germany the two western Samoan islands, *viz.*, Savaii and Upolu, with its capital at Apia; while to the United States fell the island of Tutuila and the other adjacent members of the group. Great Britain was compensated by Germany ceding her the Tonga Islands, lying to the south of Samoa, including the Savage Island group, and also the islands of Choiseul and Isabelle, in the Solomon group. She also gained certain advantages in Africa. The Samoan treaty was signed at Washington, Dec. 2, 1899, by the representatives of the three interested Powers. Equality as to freedom of trade was reserved to all three nations in the islands.

SAMPSON, Ezra, an American clergyman; born in Middleborough, Mass., Feb. 12, 1749. He graduated at Yale College in 1773, and settled at Plympton, Mass., in 1775, in which year he became chaplain in the Revolutionary army. He settled at Hudson, N. Y., in 1797, and from 1801 to 1804 was one of the editors of the *Balance*, one of the first literary journals of the country. He was appointed judge of the Columbia Co. court (N. Y.) in 1814. Among his publications are *Beauties of the Bible* (1802); *Historical Directory* (1803); *The Sham Patriot Unmasked* (1803); *The Brief Remarker* (1820); etc. He died in New York, N. Y., Dec. 12, 1823. E.E.T.

SAMPSON, William Thomas, rear-admiral U.S. navy, was born near Palmyra, N. Y., Feb. 9, 1840. At the age of 17 he entered the U.S. Naval Academy at Annapolis, and four years later graduated first in his class. At the outbreak of the Civil War Sampson was old enough to obtain a command, and his first service in the navy was on board the frigate *Potomac*, of the South Atlantic squadron, where he remained one year as master. During his first year at sea his services were so acceptable to the superior officers that he was promoted second-lieutenant. While participating in the evolutions of the South Atlantic squadron he served on board the *John Adams* (1862–63), and the *Patapsco* (1864–65).



WILLIAM T. SAMPSON.

It was the fate of Lieutenant Sampson, then only twenty-five years of age, to be acting as executive officer on board the ironclad *Patapsco* of the blockading fleet before Charleston, S. C., when that vessel was blown up in Charleston harbor by a torpedo, and sank in fifteen seconds, on Jan. 15, 1865. In his report to the Secretary of the Navy, Commander Quackenbush said: "The cool intrepidity displayed by Lieutenant Sampson, my executive officer, deserves the highest praise." Sampson afterwards became known throughout the service for just such qualities as he displayed on board the *Patapsco*. In 1866, while serving on the *Colorado*, he was made lieutenant-commander. From 1868 to 1871 he was at the Naval Academy as instructor, and in 1872–73 he was cruising in Europe and elsewhere on the *Congress*. In 1874 he reached the grade of commander, in which capacity he served on the *Alert*, a third-rate vessel. Subsequently he was despatched to the Asiatic station in command of the *Swatara*. A turn of shore duty followed from 1876 to 1878 at the Naval Academy, and in 1882 he was stationed at the Naval Observatory, a position which he held till 1885. While stationed at the Naval Observatory he was sent as a delegate to the International Prime Meridian and Time Conference, held at Washington in 1884. He also acted as a member of the board on fortifications and other defences, which met at Washington in 1885. From 1886 to 1890 he was superintendent of the Naval Academy.

In March, 1889, Sampson attained the rank of captain, and in that year was delegate from the United States to the International Maritime Conference held at Washington. In 1890 he was ordered to the Pacific coast to take command of the new United States cruiser *San Francisco*, with which he remained till 1892. In Jan., 1893, he took charge of the Ordnance Bureau, ordnance matters and torpedo work having been for many years previously Captain Sampson's special duty. On June 15, 1897, he was appointed to the command of the *Iowa*, one of the most formidable of modern battleships. On Feb. 17, 1898, he was appointed president of the naval court of inquiry which investigated the cause of the explosion which destroyed the battleship *Maine*, and reported thereon March 21, 1898. On March 26 he was made acting rear-admiral, and was promoted to succeed Admiral Sicard as commander of the North Atlantic squadron, Rear-Admiral Sicard being retired from the command on account of ill-health. The North Atlantic squadron consisted of seventy of the principal ships of the United States navy, which had assembled off Key West in anticipation of war with Spain. The President, in thus authorizing Sampson to hoist the flag of a rear-admiral, practically made him the senior flag-officer of the entire fleet of the United States war vessels on the North Atlantic coast. Admiral Sampson thus suddenly became the most prominent man of the hour in the United States navy in the approaching struggle with Spain. On April 21 he was ordered to Cuba to blockade Havana; and when Cervera's Spanish squadron was known to be in western waters, Sampson proceeded to San Juan, Porto Rico, the forts of which he bombarded (May 12), so as to discover if the enemy's fleet were secreted in the harbor. Cervera had by this time taken refuge in the harbor of Santiago de Cuba, and there Sampson and his squadron, joined by Schley and his fleet, established a close blockade until Sunday, July 3, 1898, when Cervera and his ships sought to escape from the port by flight. This rash act had its disastrous sequel in the destruction of the whole of the Spanish squadron under Cervera's command. See CEVERA, Vol. XXVI, p. 101; UNITED STATES, Vol. XXIX, p. 390.

At the eventful moment of the attempted escape of the Spanish fleet from the harbor, Admiral Sampson was on the flag-ship *New York*, four miles east of her blockading station, and seven miles from the harbor. He was on his way to Siboney to consult with General Shafter, commander of the land forces in Cuba, in regard to the situation, as a more definite understanding between the proposed operations of the land and sea forces had been rendered necessary by the unexpectedly stubborn resistance of the Spanish garrison of Santiago. While he was thus absent, the Spanish squadron appeared in the channel to make a dash through the line of blockade. The commander of the second division, Commodore Schley, took up the chase and led the fleet to victory until the *New York*, with Admiral Sampson on board, came up, and the latter resumed command. The battle of Santiago speaks highly for the skill and care of Admiral Sampson in maintaining the efficiency of his fleet and in holding the officers and men under his charge in proper readiness for the work they were there to do. If the admiral cannot be called a showy and dashing officer, he undoubtedly possesses admirable qualifications for his important command. On the day of this battle, July 3, Sampson became commodore by the retirement of Rear-Admiral Kirkland; on Aug. 10 he was made rear-admiral; and on Aug. 16 was appointed one of the three commissioners to arrange the evacuation of Cuba. Later he resumed command of the fleet on the North Atlantic station.

The destruction of Cervera's fleet gave rise to some controversy as to the credit to be given for the victory, the friends of Commodore Schley urging his claims, while the friends of Admiral Sampson affirmed that the honor rested with him. Commodore Schley himself declared that "The victory was big enough for all." This reasonable verdict the nation as a whole applauded and shared. Admiral Sampson died May 7, 1902.

SAMSON, GEORGE WHITEFIELD, clergyman and educator; was born at Harvard, Massachusetts, on September 29, 1819, and was graduated from Brown University in 1839 and from Newton Theological Seminary in 1843. He served in the ministry of the Baptist Church until 1859, when he became the fifth president of Columbian University, Washington, D. C. He extended the scope of that institution by building and opening its law school in 1865, but in 1871 resigned the presidency and became the head of the Rutgers

Female College in New York city. That place he resigned in 1875, but resumed it in 1886. He wrote *The Spiritual Medium* (1852); *Physical Media in Spiritual Manifestations* (1868); *Outlines of the History of Ethics* (1860); *Elements of Art Criticism* (1867); *The Atonement* (1878); *Divine Law as to Wines* (1880); *English Revisers' Greek Text Shown to be Unauthorized* (1882); *Guide to Self-Education* (1886); *Guide to Bible Interpretation* (1887), and *Idols of Fashion and Culture* (1888). He died in August, 1896. W.F.J.

SAMSUN, Turkey in Asia, a seaport town in the vilayet of Trebizond on a deep bay indenting the southern shore of the Black Sea, 85 miles southeast of Sinope or Sinub with which it has steamer communication as also with neighboring ports, including Batum in Russian Caucasia. A wagon road extends into the interior beyond Amasia and Tokat to Sìvàs (q. v., Vol. XXII, p. 110), an important receiving and distributing center for Oriental and Occidental merchandise which passes through the port of Samsun. The inhabitants comprise Mohammedans, Greeks, and Armenians. Population, 12,000. C.L.S.

SAMUELSON, James, a British author; born in Hull, England, in 1829. He studied zoölogy in Königsberg University; was called to the bar in 1870, but never practiced; engaged in manufacturing enterprises, but left the management to his sons, and devoted most of his time to travel and writing; founded and was president of the Liverpool Science and Art Classes, and frequently acted as an intermediary in labor troubles, especially in the Dock Strikes of 1879. He wrote a scientific work, *Humble Creatures* (1860); *Roumania, Past and Present* (1882); *India, Past and Present* (1889); the social works, *The German Workingman* (1869) and *The History of Drink* (1879). He was editor of a quarterly review called *Subjects of the Days.*

SAMURAI. See Japan, Vol. XIII, pp. 589, 593.

SAN ANGELO, a town and the capital of Tom Green County, southwestern central Texas, on the Concha River and on the Gulf, Colorado and Santa Fé railroad, about 180 miles W.N.W. of Austin. The chief industries are ice-manufacturing and flour-milling. The surrounding country is devoted to the raising of cattle, sheep and horses; fruit is abundantly produced, and good building-stone is plentiful. Population 1890, 2,615; 1900, 2,700.

SAN ANTONIO, Texas. In 1890 San Antonio was the center for four railroads, the International and Great Northern, San Antonio and Aransas Pass, San Antonio and Gulf Shore and the Southern Pacific. In the line of manufactures it has cars and general shop construction works, foundries and machine-shops, factories for the production of doors, sash, blinds, cigars and tobacco, printing and publishing houses, and saddlery and harness shops, etc., all of which are in active operation, numbering, in 1900, 312 establishments, with an aggregate capital of $4,252,197. It has a system of water-works, many miles of paved streets, electric lights and a well equipped electric-railway service. Besides a fine system of public schools, there are a number of institutions under personal and denominational control. The notable buildings are a county courthouse costing nearly $1,000,000, a United States government building, several hospitals, and halls belonging to secret societies. The surrounding region is devoted to agriculture and grazing, and does a large business in cotton, wool, hides and live-stock. Population 1890, 37,673; 1900, 53,321.

Fort Sam Houston, a United States military post in the Department of Texas, is situated two miles N. of San Antonio, which is the post-office, telegraph and railroad station for the post. The fort is in a reservation covering 469.23 acres, and has accommodations for 34 officers, 3 troops of cavalry, 8 companies of infantry and one light battery. In 1895 it was garrisoned by two troops of cavalry, eight companies of infantry and a battery of artillery. For general article, see San Antonio, Vol. XXI, p. 267.

SAN ANTONIO RIVER, a stream formed by the union of Medina River and Leon Creek, in Bexar County, southeastern central Texas. After flowing southeasterly for about 175 miles, through the counties of Wilson, Karnes and Goliad, it enters the Gulf of Mexico, 130 miles S.W. of Galveston, by way of Espiritu Santo Bay.

SAN BERNARDINO, California, the seat of the southeastern county of the same name, a city at the foot of the northwestern slopes of the San Bernardino ridge of the Coast Range, and a junction of three branches of the Southern California and two divisions of the Southern Pacific Company railroads, 60 miles east of Los Angeles. The equable climate and the splendid neighboring mountain scenery make San Bernardino a frequented summer and winter health resort. It exports the products of a large metalliferous, farming, and fruit-raising region, and has large railroad workshops. Population, 1890, 4,012; 1900, 6,150. C.L.S.

SAN BLAS, Mexico, a seaport town on the Pacific Ocean in the territory of Tepic and the state of Jalisco, about 150 miles south of Mazatlan and the same distance west by north of Guadalajara, the state capital. The estuary of the Santiago River and a land locked bay afford a safe harbor for small coasting vessels, larger vessels anchoring in the outer roadstead to which the islands of Las Tres Marias form a natural breakwater. A small railway penetrates the interior to Huaristembe. Silver from the mountain mines is the most valuable article of export. Population, 5,000. C.L.S.

SAN BLAS, Cape, the extreme southern point of Calhoun County, northwestern Florida, about 125 miles S.E. of Pensacola, in lat. 29° 39′ 46″ N., and long. 85° 21′ 38″ W. It has a revolving light 98 feet in height.

SAN BLAS, Gulf or Bay of, a bay on the northern side of the Isthmus of Panama, in long. 79° W., where the isthmus has its narrowest point, being but 31 miles wide here, and takes the

name of San Blas. This neck of land has at times been suggested as a route for an inter-oceanic ship-canal, but surveys have shown the project to be impracticable, owing to the high mountains which would have to be crossed.

SAN BONIFACIO DE IBAGUÉ, a town and the capital of the department of Tolima, western central Colombia, 90 miles W. of Bogotá, on western affluents of the Magdalena River, on a plateau having an elevation of 4,300 feet. It has a healthful climate and is the center of a district producing tropical and semi-tropical fruits. There are, in the vicinity, warm springs, sulphur-deposits and silver-mines. The port of the town is Guataquisito, on the Magdalena River, to which a railroad is projected. Population about 13,000.

SANBORN, Franklin Benjamin, an American journalist; born in Hampton Falls, N. H., Dec. 15, 1831. He graduated at Harvard in 1855; has been a lecturer at Cornell University, at Smith and Wellesley colleges, and at the Concord School of Philosophy. He has been editor of the Boston *Commonwealth*, the *Springfield Republican*, and the *Journal of Social Science*, 1876–97. He was one of the founders of the American Social Science Association, and has written several biographical works and *A History of New Hampshire*, and has edited several State reports on charities, labor, etc. E.E.T.

SAN BUENAVENTURA, a city and the capital of Ventura County, Southern California, on the Pacific Ocean, and on the Southern Pacific railroad, about 60 miles W.N.W. of Los Angeles. It was the seat of an old Spanish mission, from which it derives its legal name, its post-office designation being Ventura. It is the center of a district engaged in agriculture and fruit-growing; has a fine harbor, and possesses hot springs, which, with the healthful climate, have made the place a popular resort for invalids. Population 1890, 3,869; 1900, 2,470.

SAN CARLOS or BARINAS, a town of Zamora, Venezuela, 120 miles W.S.W. of Caracas, near the Santo Domingo River. The town, which has been twice devastated, was founded in the sixteenth century, and is now noted for its large shipments of tobacco. Population, about 7,000.

SANCTIFICATION. See Paul, Vol. XVIII, p. 436.

SAND. See Geology, Vol. X, pp. 216, 217.

SAND, George. See Dudevant, Mme., Vol. VII, pp. 438–441.

SAND-BLAST. See Vol. XXI, p. 269.

SANDELWORT, a member of the sandalwood family. See Sandalwood, Vol. XXI, 268, 269.

SANDEMAN, Robert, and SANDEMANIANS. See Glas, John, Vol. X, pp. 567–568.

SANDERLING, a bird. See Sandpiper, Vol. XXI, p. 273.

SANDERS or RED SANDERSWOOD. See Sandalwood, Vol. XXI, p. 269.

SANDERS, Nicholas (1527–79), an English Roman Catholic clergyman; an Oxford graduate; religious refugee in Rome; papal nuncio at Madrid; organized an invasion of Ireland; author of a Latin treatise on the Anglican schism. See Ireland, Vol. XIII, p. 270.

SANDERSON, John, author and educator; was born near Carlisle, Pennsylvania, in 1783, and at first studied for the bar, but eventually became a teacher and author. He was for some years professor of Latin and Greek in the Philadelphia High School, and it was through his efforts that those languages were retained at Girard College. He contributed to the *Knickerbocker Magazine*, and wrote two volumes of biographies of the signers of the Declaration of Independence; a *Defence of Classical Literature as a Branch of Study in Girard College*, and *Sketches of Paris*. He died on April 5, 1844. W.F.J.

SANDERSON, Sir Percy, diplomat; was born in London on July 7, 1842, entered the Indian army and served with distinction until 1870. He then entered the consular service, and was stationed in Roumania for some years. From 1881 to 1886 he was *chargé d'affaires* at Bucharest. In 1882 he was a commissioner for the navigation of the Danube, and was on special service at the Danube Conference of 1883. He was knighted in 1899, and since 1894 has been British consul-general in New York. W.F.J.

SANDERSON, Sybil, famous American opera singer, born in Sacramento, Cal., 1869, died in Paris, May 16, 1903. She made her debut at The Hague in 1888 and had a highly successful career in Germany, France and the United States. In 1897, she married Antonio Terry, the Cuban millionaire.

SANDERSVILLE, a city and the capital of Washington County, eastern central Georgia, on the Augusta Southern and the Sandersville railroads, about 70 miles S.W. of Augusta and 64 miles N.N.E. of Macon. It is situated in a fertile district devoted to farming and the raising of cotton, the shipping-trade in the latter product being quite considerable. Population 1890, 1,760; 1900, 2,023.

SAND-FLIES or SIMULIUM. See Mosquito, Vol. XVI, p. 894.

SANDHOPPER or ORCHESTIA. See Crustacea, Vol. VI, p. 585.

SANDHURST. See Army, Vol. II, p. 512.

SAN DIEGO, California, the seat of a county of the same name, a seaport and city on a beautiful landlocked bay of the Pacific Ocean, 18 miles north of the Mexican boundary, 500 miles southeast of San Francisco and entered by six lines of railroad. The crescent shaped bay, 5 miles long and 1 mile wide, is, next to San Francisco, the best harbor in California. Its entrance is marked by Point Loma, a steep bluff 300 feet high, forming the extremity of a mesa-like plateau rising to a maximum height of 450 feet, and extending southward for six or seven miles. Point Loma dominates the low, slender peninsula and summer colony of Coronado Beach, with its enormous hotel, which a steam ferry across the bay connects with the town built along the shore and on the slopes that rise from the water. The bay discovered by Cabrillo in 1542 was surveyed and named by Sebastian Viscaino, in 1603; in 1769, two expeditions under Spanish religious auspices,

arrived here, and established the mission of San Diego, under the direction of Father Junipero Serra. Besides being one of the most frequented health and pleasure resorts on the Pacific coast, on account of its ocean climate, suburban and historic attractions, San Diego is the trade center of a large citrus-fruit, vine-growing, and honey-producing region. Its manufacturing interests include dried and salt fisheries, breweries, wine, ice and soap factories, iron and machine works, lumber and brick yards. Steamers connect with San Francisco and all important Pacific coast ports, and a periodical trans-oceanic line communicates with China, Japan, and Hawaii. Population, 1890, 16,159; 1900, 17,700. C.L.S.

SAN DIEGO, a town and the capital of Duval County, southeastern Texas, on the Mexican National railroad, about 55 miles W. of Corpus Christi. The staple products of the county are cattle and horses. The inhabitants are mostly Mexicans. Population about 900

SAND-LANCE OR SAND-LAUNCE. See SAND-EEL, Vol. XXI, p. 270.

SANDS, BENJAMIN FRANKLIN, an American naval officer; born in Baltimore, Md., Feb. 11, 1811. He entered the navy in 1828 and rose to rear-admiral in 1871. He was engaged in the suppression of the slave trade, 1848–50; served with the North Atlantic squadron in the Civil war, being senior officer at the blockade of Wilmington, commanding the division that blockaded the Texan coast, and taking Galveston. He was superintendent of the naval observatory at Washington, 1867–73; was retired, Feb., 1874. He died in Washington, D. C., June 30, 1883. E.E.T.

SAND-STAR OR OPHIURIDEA. See ECHINODERMATA, Vol. VII, pp. 544, 550.

SANDSTONE. See GEOLOGY, Vol. X, 212.

SANDUSKY, a city and the capital of Erie County, Ohio. Population 1890, 18,471; 1900, 19,664. See also SANDUSKY, Vol. XXI, p. 273.

SAND-WASP. See HYMENOPTERA, Vol. XII, p. 607.

SANDWICH, a manufacturing town of Dekalb County, northern Illinois, on the Chicago, Burlington and Quincy railroad, 18 miles W.S.W. of Aurora and 57 miles in the same direction from Chicago. It produces cheese, flour, windmills and agricultural machinery. Population, 1900, 2,520.

SANDWICH, Massachusetts, a seaport town of Barnstable County, on Sandwich Harbor, a southwestern inlet of Cape Cod Bay, and on a division of the New York, New Haven & Hartford railroad, 62 miles southeast of Boston. It occupies the site of the Indian Shawme and is a favorite summer resort, affording fine fishing. In an agricultural section producing special crops of cranberries, it also has glass and lamp making industries and manufactures silk braids, jewelry, etc. Population, 1890, 1,819; 1900, 1,448. C.L.S.

SANDWICH, a post village and the capital of Essex County, southwestern Ontario, Canada, on the Detroit River, nearly opposite Detroit, and about two miles S.W. of Windsor. It is one of the oldest settlements in this part of Canada. Colonization is said to have begun in 1700, when the place was known as Pointe de Montréal. A house of the Basilian Monks, and Assumption College, a Roman Catholic institution, are located here. The existence of mineral springs makes it a resort for invalids. It has a brewery and several mills. Population, 1891, 1,352; 1901, 1,450.

SANDWICH ISLES. See HAWAIIAN ISLANDS, Vol. XI, pp. 471–476; and in these Supplements.

SANDY HILL, New York, a village of Washington County, 53 miles north of Albany on the Delaware & Hudson railroad and canal, and on the east bank of the Hudson River at a bend where Baker's Falls 50 feet high and the rapids above, furnish power to paper and other mills. Population, 1900, 4,473. C.L.S.

SANDY HOOK, New Jersey, a narrow sandy strip of land projecting from the northeastern point of Monmouth County, and with its lighthouse a prominent landmark at the western entrance to the Lower Bay, 18 miles south of New York city. From half a mile to a mile wide, the low lying peninsula extends five miles north from Old Shrewsbury Inlet and the southern point of the Navesink Highlands, and is traversed by the Long Branch & Sea Shore railroad, connecting various summer resorts and the government ordnance testing grounds. C.L.S.

SANDYS, JOHN EDWIN, classical scholar; was born in England on May 19, 1844, and was educated at St. John's, Cambridge, where he was one of the most brilliant scholars. He has written and edited many works on the classics, including Demosthenes, Aristotle, Euripides and Cicero, a *History of Classical Scholarship*, and a *Dictionary of Classical Mythology, Religion, Literature, Art and Antiquities*. He has received honorary degrees from Cambridge and Dublin universities. W.F.J

SANDYS, SIR EDWIN, an English scholar and statesman; born about 1561. He was educated at Corpus Christi College, Oxford, under the learned Dr. Hooker. He then went on his travels and published the results of his observations in quarto, under the title of *Europæ Speculum*. He was knighted by James I, who employed him in many important missions. He left £1,500 to the University of Oxford for the endowment of a metaphysical lectureship. He died in 1629. E.E.T.

SAN FELIPE DE ACONCAGUA. See ACONCAGUA, Vol. I, p. 92.

SAN FILIPPO D'ARGIRÒ, a town of southeastern Sicily, in the province of Catania, situated on the right bank of the Traina. A considerable quantity of saffron is grown in the vicinity. Population, 10,836.

SANFORD, Florida, a city and winter resort of Orange County, 125 miles south of Jacksonville, entered by six lines of railroads. On the St. Johns River at the expansion of Lake Monroe it also has steamboat connections with various river ports, and is the shipping center for a large

farming district in which great attention is devoted to lettuce, celery and fruit for northern markets. It has railway repair shops, fruit-preserving, and cigar factories. Sanford was settled in 1870. Population 1890, 2,016, 1,900, 1,450. C.L.S.

SAN FRANCISCO, a city of western California, destroyed by the earthquake of April 18, 1900. Among the notable buildings erected since 1880, in San Francisco were the new City Hall, the Crocker Building, the Chronicle Building, Academy of Sciences, Pioneer Hall, the Lick Public Baths and the Mills Building. The city was lighted by gas and electricity, and local transit is carried on by cable and electric street-railways. In 1890 there were 135 churches, divided among almost all the leading denominations. Some of the well-known church edifices included St. Mary's Cathedral (Roman Catholic), Grace Church (Protestant Episcopal), Trinity Cathedral (Protestant Episcopal), Sherith Israel Synagogue, and Calvary Presbyterian and the First Unitarian churches. The Chinese, also, had six large joss-houses. According to the school census of 1893 the number of children of school age (5 to 17 years) was 68,390, of which 44,349 were enrolled in public schools, and 8,973 in private or parochial schools. The value of public school property was estimated at $5,063,363, and expenditures of the year were $989.009. There were also numerious institutions for higher education and technical and professional training, some of the more important of those recently established being the Hastings College of Law, the Dental Department of the University of California, also the medical and pharmaceutical departments of the same university, a training school for nurses, and an industrial school. The Mechanics Institute, the Academy of Sciences and the Lick Mechanical Art School were all devoted to technical education. Among the numerous libraries were the Bancroft, having 45,000 volumes; the Bibliotheque de la Ligne Nationale Française, 13,000; the Free Public, 69,000; the Mechanics Institute, 57,900; the Mercantile Library Association, 62,000; the Odd Fellows, 42,500; the St. Ignatius College, 30,000; the San Francisco Law, 31,000; the Sutro, 200,000.

In the returns for 1900 there were reported 4,002 establishments, employing $80,103,367 in capital, paying $22,037,527 in wages to 41,978 persons, and $79,492,952 for materials, from which were turned out products valued at $133,069,416. According to capital employed, the principal industries were refining of sugar and molasses, breweries, manufactures of men's clothing, foundries and machine-shops, coffee and spices, boots and shoes, flour and grist mills, leather, canning of fruits and vegetables, printing and publishing, saddlery and harness, shipbuilding, slaughtering, and cigars and tobacco. The population, which, in 1880, was 233,959, was in 1900, 342,782.

SAN FRANCISCO EARTHQUAKE. The severest earthquake in the United States occurred on the Pacific Coast April 18, 1906. The sudden and terrifying rocking of the earth began at 5:13 A. M. and lasted three minutes. The seismograph at the Government Weather Bureau Office in Washington showed such violent agitation that the pen passed off the recording sheet. The delicate instrument denoted vibrations of considerable magnitude which continued for three hours with gradually diminishing force. The wave extended across and beyond the American Continent. The shock was followed immediately by a conflagration, which devastated a territory of four square miles, *i. e.*, the entire city with the exception of a factory district in the south and a few residence districts in the north and west. Only the sky scrapers escaped the general destruction. The flames that broke out with maddening fury did more damage than the earthquake, though the latter caused the main loss of life, estimated at about 400. The total destruction of property from both causes was estimated at $350,000,000. The loss of books of public libraries and institutions amounted to 597,000 volumes.

At Santa Rosa, sixty miles north of San Francisco, the shock followed by conflagration caused the destruction of the entire business part and the loss of about one hundred lives. At Palo Alto, the Leland Stanford Jr. University suffered great damage, while Salinas, Napa, San Jose, Hollister, Santa Cruz and other towns suffered severely.

SAN FRANCISCO, The New. The reconstruction of San Francisco from the ruins left by the earthquake of April 18, 1906, and the fire raging from April 18-20, borders on the miraculous. Modern San Francisco is a city of steel and concrete, more cosmopolitan than ever and more interesting than before. The value of property is estimated at more than $100,000,000 over property values before the great fire. The imports, of which San Francisco handles more than three-fourths of the Pacific Coast, amounted in 1906-07 to $54,094,570; the exports to $33,026,664. The bank clearings for the year ending April 18, 1908, were close to $2,000,000,000.

The fire of April 18-20, 1906, destroyed 512 blocks of buildings, valued at $105,000,000. According to the statistics published by the California Promotion Committee, buildings to the value of $102,186,000 have been erected during the last two years, 28,188, frame or low brick structures being replaced by 14,270 modern structures. They include 63 Class "A" fire-proof buildings, valued at $16,453,000; 95 re-enforced concrete, brick or stone, valued at $7,036,670; 1907 concrete, brick or stone, valued at $33,547,210; 8,817 frame buildings, valued at $37,139,694; alterations to the number of 4,198, valued at $8,010,900. The money for all this work was furnished by San Francisco capital with the exception of about $3,500,000. During the month of April, 1908, building permits to the amount of $2,786,686 were issued; and the record in municipal improvements of 1908-09 will surpass that of 1907, the citizens of San Francisco having voted in May, 1908, in favor of an $18,200,000 bond insurance for that purpose. In spite of this tremendous outlay of money, the percentage of the city's mortgaged indebtedness in relation to the value of real estate

is only seventeen. San Francisco has now a population of 480,000 and with the suburbs of 815,000. The latter include Oakland with 235,000; Berkeley with 36,000; and Alameda with 25,000 inhabitants.

SAN FRANCISCO MOUNTAINS, Arizona, an isolated ridge in Coconino County, rising 12,794 feet above ocean level.

SANGIR OR SANGI ISLANDS, Dutch East Indies, a chain of small islands with an aggregate area of 350 square miles, extending between the southern point of Mindanao Island in the Philippines and the northeastern end of Celebes. Population (estimated), 50,000.

SANGSTER, MARGARET ELIZABETH MUNSON, an American journalist; born in New Rochelle, New York, Feb. 22, 1838. She wrote for *Hearth and Home* (1871-73), *Christian at Work* (1873-79), *Harper's Young People* (1882), became editor of *Harper's Bazar* 1889. She published *Poems of the Household* (1883), *Home Fairies and Heart Flowers* (1887), *Hours for Girls; Splendid Times;* and *On the Road Home* (1894).

SANGUINARIA. See BLOODROOT, in these Supplements.

SANHEDRIM. See SYNERIUM, Vol. XXII.

SANITARY COMMISSION. At the outbreak of the Civil War the Army Medical Bureau found itself face to face with a task with which it was unable to cope, especially as legislation was lagging far behind the sudden growth of the army. Local organizations had sprung up everywhere, devoted to the welfare and comfort of the army, and it was through an endeavor to systematize these that the Sanitary Commission arose. Drs. Henry W. Bellows, Van Buren, Harsen and Harris held a conference with the government and urged the necessity of doing something to lessen the peril arising from bad sanitary condition. Finally, the Medical Bureau consented to the formation of a non-official association for such work, and on the 9th of June, 1869, the Secretary of War authorized Rev. Dr. Bellows, Prof. A. D. Boche, Walcott Gibbs, Drs. Jeffries Wyman, W. H. Van Buren and S. I. Howe, and three army officers, A. E. Shiras, G. W. Cullum and Dr. R. C. Wood, to act as such a board, and associate others with them at their discretion. Thus the Commission escaped officialism, and was able to throw itself upon the sympathies of the public. However, the Commission was in fact merely an advisory board which acted through the Medical Board, an institution hindered by obsolete traditions and regulations. But, early in 1862, measures were taken by Congress to secure a greater freedom of action for the Commission. In order to facilitate research and the distribution of stores in emergencies, a system of inspectors was appointed, to whom were given such duties as required contact with those in authority and the direction of operations in the camps. They were usually men of wide medical learning, were pledged for a certain time, and were subject to such drill and regulations regarding promotion as the service would allow. Dr. Henry G. Clark, with a corps of sixty of these inspectors, undertook to investigate the hospitals, with a view to gathering information which would lead to their improvement. Out of this grew the American pavilion hospitals adopted by the government.

At first the facilities for transportation of stores was limited, as the medical department was dependent upon the quartermaster for these. But the commission fitted out trains of horses and wagons, chartered and fitted up steamboats, at the expense of the government, and constructed hospital-cars for the care and transportation of sick and wounded soldiers.

They were constantly on the watch to prevent the introduction or development of disease. Their influence with the regimental surgeons was great in bringing about the proper selection of camp sites, proper cooking, drainage and cleanliness. But their chief services in this capacity was the securing of proper food when the army was assailed by scurvy, smallpox, yellow fever, or other diseases. They even went so far as to start several immense truck-gardens for supplying vegetables to the army, while all luxuries, like ices, wines, etc., for the sick, passed through their hands.

Thousands of men were constantly passing to their regiments at the front, or being dismissed, were going home, or were being moved from one point to another. In the early part of the war especially there was much confusion, owing to general ignorance of rules and incompetent officers. In many cases these men encountered difficulties in securing their pay or papers, were in ill health, or beset by swindlers. The Commission did what it could to help these men, gave them food, furnished information, and even acted as their attorneys in securing pay or papers, and secured the acquittal of many who were wrongfully accused of desertion. As many as forty homes or resting-places were established for this purpose, near depots of transportation and centers of distribution. This branch of the service afterward developed into the Pension and War Claim Bureau.

For regular soldiers two forms of aid were provided,—one known as "general relief," which concerned hospitals, the other being known as "battle-field relief." Besides the inspectors, scores of assistants and relief agents, some of whom were women, and all educated and competent persons, were attached to each column. They looked after all matters of sending wounded to the rear, attended their injuries and provided for their proper transfer to the permanent hospitals. One of the noteworthy institutions established by this Commission was the Soldiers' Directory, in which over six hundred thousand names appeared. All latest information was added, so that questions regarding any of the men whose names were in the directory could be answered correctly.

The Sanitary Commission, by reason of its non-official nature, appealed to the citizens, and it gradually became "the vehicle of a nation's bounty." It was the medium through which women could make sacrifices for their imperiled country, many going

to the front as nurses or even attendants on battle-fields, while others worked at home, preparing with loving hands the comforts for the men suffering at the front.

It has been estimated that $15,000,000 worth of supplies was received by the Commission, while $4,962,014 was poured into its treasury. In the early part of the war, before it had gained a reputation, supplies came slowly, but at the latter end they poured in from all directions. Fairs were carried on in different cities for its benefit, which netted nearly $3,000,000, while $745,000 were sent by foreign countries. While the commissioners served without pay, it became necessary to furnish regular salaries to officers and agents, in order to avoid an irregular and constantly changing service. The original board appointed by the Secretary of War, together with their associates, numbered 14, with headquarters in Washington. This board created a standing committee, with headquarters in New York, which remained in daily session till the end of the war. It consisted of Dr. Bellows, Drs. Van Buren and Agnew, Professor Gibbs, G. T. Strong and Charles J. Stillé, who later became its authorized historian. The executive duties of the board fell upon F. L. Olmsted and John S. Newberry; the former, who was succeeded by Dr. Jenkins, was secretary of the board and the latter secretary of the western division. The commission established a Bureau of Vital Statistics, whose reports were extremely valuable and have done much to reorganize the medical service of both army and navy.

SANITARY CONVENIENCES OF MODERN HOUSES. The increased use of indoor closets, sinks, basins, etc., in many-storied buildings makes the matter of arrangement of these sanitary conveniences one of material interest, as affecting the health of all the occupants. The most marked change in connection with his work, within recent years, has been in the direction of placing the plumbing connections in more accessible locations. Formerly, it was considered desirable to place all the plumbing out of sight, within floors and petitions, or in dark closets, under stairways, or in out-of-the-way corners. They were considered unsightly. Now the best practice is to use exposed plumbing, as much as a due regard for appearances will permit, and the pipes are often gilded and made otherwise ornamental. The reason of the change is based on common sense. The drainage, soil and waste pipes of a building carry foul matter and give out bad air wherever there is a leak. I hid away, leaks are not discovered readily, and malaria and fevers spring out as the first indication that repairs are needed to the pipes. With plumbing arranged for easy inspection, leaks are apt to be noticed and promptly repaired, preventing the ills that follow in their train.

Cast-iron pipe is commonly used for drain and soil pipe in the United States, while lead pipe is frequently preferred in Great Britain, the claim being made that it is smoother and allows a freer flow. American drain-pipe, however, is amply smooth, and entirely satisfactory. Trouble will arise with any kind of pipe if there is not sufficient fall allowed to give enough speed to the fluid to render the pipes self-cleansing. Four-inch pipe should have a flow of at least four feet a second, and six to nine inch pipe should be given a flow at the rate of three feet a second.

A lavatory, or wash-basin, is often an annoyance, from the choking up of the valve with soap and accumulated dirt. Some sort of a screen has to be placed over the outlet, and the ordinary flowing out of the water is hardly sufficient to keep it clean. A recent device for overcoming the difficulty is a flushing-rim, which drives the water around circularly with considerable force and rinses the basin. Another good form of lavatory has a push-down piece, which raises the valve completely, allowing free flow into the outlet. This basin is made in one piece, of glazed earthenware, so that it is easily cleaned and kept in condition. It is provided with brass cylinder traps, having unions all ground to accurate fits. Kitchen sinks are troublesome to the plumber, as it is from them that the most grease and refuse usually gets into the pipes. Some of them are supplied with special grease-traps, but unless these are cleaned at regular intervals they become a foul nuisance. One of the best sinks is made of copper, with nickel-plated waste and overflow, and so recessed at the waste that the kitchen-maid can readily scrape up the grease as it accumulates there, without allowing it to go down the pipes. When the pipes become heavily coated with grease they retain various food-scraps, which rot and give off unwholesome odors. In such a case, hot water and ammonia should be poured down in liberal quantities to cut out the grease. It is best to connect kitchen sinks with the nearest soil-pipe, because the natural animal ammonia in the latter is usually sufficient to carry off all grease beyond that point.

Bath-tubs are made of galvanized sheet-iron, with a wood body; of zinc or copper, tinned or nickel-plated; of cast iron, with porcelain enamel; and of indurated fiber enameled. Porcelain tubs are preferred for hospital use, being non-absorbent, but copper is most commonly used for dwellings. In the more recent patterns, the tubs are not inclosed with wood, but stand on four metal feet, with exposed piping. Some are made independent of the heating-appliances in the house, having a set of tubes at the end, below which are placed gas-burners for heating the water and causing it to circulate.

Laundry tubs are made of soapstone, cement stone, galvanized iron, etc. White crockery or ceramic ware is considered the best and most expensive material for this use. Slop-sinks and slop-hoppers are well enough made of any of the common materials, but they should be regularly flushed and cleaned with soap and hot water,—a rule which is too frequently honored in the breach. There are few conveniences on the market for keeping them wholesome.

So much attention has been given to water-closet construction that almost all the bad and unscientific devices have been driven out, and the common form of bowls, cisterns and traps are entirely requisite for the purpose, if kept in order. Traps are made in innumerable forms. They are best made to com-

bine both a mechanical and a water seal, or with a double seal, as in the siphon closet. Here the lower part of the bowl becomes a water-seal and the trap below contains another. When a flood of water is supplied from the cistern, the upper water forces the air in the space between the traps through the water of the lower trap, thus establishing a siphoning action which assists in drawing off the contents of the bowl. It is very common to unite the crockery bowl of the closet with the floor, by allowing the lower end of the trap to project into the pipe, or by means of flush-connections. Both methods are bad. While the former cannot leak water, it is very apt to leak sewer-gas. The best method, now coming into use, is to allow the end of the soil-pipe to project above the floor and into the trap. Then if the joint ever leaks it will be water that comes out, and the leak will be detected at once, and can be repaired.

The chain-pull cistern for closets commands the market, though for public places the seat-depression flow is often preferred, or the automatic flushing at regular intervals. The ordinary cistern has a float-valve, which closes the inflow-hole in the water-pipe as soon as the cistern is full. It is not considered safe to flush direct from the water-supply pipes, as there may be occasional low head in the pipes, allowing foul air to get in and contaminate the drinking-water. The automatic flushing is performed by a gravity apparatus, in which there is a bowl supplied with a small stream of water. If it is set to flush every half-minute, at the end of that time the water in the bowl gives it sufficient weight to overturn, throwing its contents down the pipe for a flush. At the same time a similar bowl, mounted opposite to the one overturned, takes its place under the stream of water until it is filled, and, overturning, brings the first bowl into place again. Good ventilation should always be provided for closets. If they cannot have outer windows, then an air-shaft should be placed contiguous to them. Where the climate admits, they are best placed beyond the outer walls of the house. Basement closets are objectionable, as all accidents in the way of leaking sewer-gas contaminate the whole house, and because they are most liable to get out of order, and remain so for want of inspection by competent persons, they being usually left wholly to the care of domestics.

The ventilation of dwellings is much neglected. It is usually supposed that the chimney-flues and the windows will afford all the air required. Fresh air without draft is what should be provided, and what not one dwelling in a hundred is designed to furnish its occupants. A perforated panel below a window, with numerous minute holes, is a good method of admitting air without noticeable draft. A hole in the chimney-flue, with a shutter to cut off any down-blow of smoke, is another simple device more commonly employed. Chowne's siphon ventilating system is used by some architects, especially in large buildings, where these matters receive more attention. It is based on the principle that an upright J-shaped tube always gives the air a tendency to rise in the longer leg, and to fall in the shorter leg. By making use of some ornament for the short tube, and utilizing flues for the long tube, convenient ventilation may be obtained without any visible appliances.

C. H. COCHRANE.

SAN JACINTO, BATTLE OF. See HOUSTON, Vol. XII, p. 318.

SAN JOAQUIN RIVER AND VALLEY. See CALIFORNIA, Vol. IV, pp. 618, 619; and STOCKTON, Vol. XXII, p. 589.

SAN JOSÉ, the capital of Santa Clara County, California, on several branches of the Southern Pacific railroad. The city is noted for its rapid growth, delightful climate and charming surroundings, made up of gardens and orchards, evidencing the high degree of culture possible, as also the care and taste whereby such luxuriant growth and development is attained. It contained, in 1902, several state banks with a combined capital of $1 590,000, a national bank with capital of $500,000, numerous churches, a state normal school, and the Academy of Notre Dame, the State Asylum for the Chronic Insane, a United States government building, and the first electric tower erected in America, constructed of iron and two hundred feet in height. Two daily and seven weekly papers and three monthly periodicals are published, and the hotels furnish abundant accommodation for a large number of guests. Iron foundries, machine-shops, tanneries, flour and saw mills, and other branches of manufactures are successfully operated, and fruit is extensively canned and shipped. No. of industries (1900), 344; capital $3,409,517. Pop. 1890, 18,060; 1900, 21,500. See also SAN JOSÉ, Vol. XXI, p. 278.

SAN JOSÉ, the capital of Costa Rica, Central America. See SAN JOSÉ, Vol. XXI, p. 278.

SAN JOSÉ OR SAN JOSÉ DE GUATEMALA, a town and port of Guatemala, 58 miles S.S.W. of the city of Guatemala, with which it is connected by rail. It has only an open roadstead, with an iron pier running out past the surf, and vessels load and discharge by lighters. A very considerable trade is carried on, the yearly imports amounting to about one million two hundred and fifty thousand dollars. Population, about 1,500.

SAN JUAN, a western province of the Argentine Republic, between lat. 30° and 32° S. and long. 68° and 70° W., bounded on the west by Chile, on the north, south and east by the provinces of Rioja, San Luis and Mendoza; has an area of 33,715 square miles; surface varied by mountains and large sandy plains; principal rivers, the San Juan, Jachal, and Bermejo; rich in minerals, having gold, silver, copper, and deposits of coal, but the mining industry is undeveloped. The province is almost entirely devoted to agriculture, which, owing to the dryness of the climate, is carried on principally along the rivers, where irrigation is made use of. The chief productions are corn, wheat, lucerne, fruit, and grapes. Large quantities of a very fine wine are made. Population of the province, in 1905, 102,569. The capital, San Juan, partially destroyed by an earthquake in 1894, had a population of 11,000 in 1901, and was supplied with electric tramways. For the location of the town, see SAN JUAN, XXI, p. 278.

SAN JUAN ARCHIPELAGO. See SAN JUAN ISLANDS, Vol. XXI, p. 279.

SAN JUAN BAUTISTA, a town of PORTO RICO; q. v., Vol. XIX, p. 547.

SAN JUAN DEL NORTE. See GREYTOWN, Vol. XI, p. 173.

SAN JUAN DEL SUR OR GUARDIA, Nicaragua, a small seaport town on the Pacific Ocean, 20 miles south of Brito at the mouth of the proposed Nicaragua canal, and 68 miles southeast of Managua. It is a station of the submarine telegraphic cable connecting north with San Salvador and south with Panama, and as the nearest Pacific port to Lake Nicaragua, has an active transit trade. C.L.S.

SAN JUAN RIVER. See NICARAGUA, Vol. XVII, pp. 490, 491.

SANKEY, IRA DAVID, an American singer and composer; born in Edinburgh, Pa., Aug. 28, 1840. He removed to New Castle, Pa., joined the Methodist Episcopal Church, and became choir-leader, Sunday-school superintendent, and president of the Young Men's Christian Association in that town. In 1870 he met Dwight L. Moody at an international convention of the Young Men's Christian Association at Indianapolis, and became associated with him in his revival services, conducting the singing, etc. He composed and wrote many hymns, and compiled collections of sacred songs, including *Gospel Hymns*, *Sacred Songs and Solos*, which are said to have had a circulation of over 50,000,000 copies and have been translated into many languages. Among his compositions are *The Ninety and Nine; When the Mists Have Rolled Away;* etc. He gave a public library and a Y. M. C. A. building to the town of New Castle. Died Aug. 13, 1908.

IRA D. SANKEY.

SANKHYA, a system of Hindu philosophy. See SANSKRIT, Vol. XXI, pp. 289–290.

SAN LAZZARO. See MECHITHARISTS, XV, 784.

SAN LEANDRO, California, a seaport town of Alameda County on an inlet of San Francisco Bay, 8 miles by rail S. of Oakland, and 16 miles E. of San Francisco across the bay. It has farming and manufacturing industries and an export trade. Population, 1900, 2,253. C.L.S.

SAN LUCAS, CAPE, Mexico, the southermost point of Lower California, between capes Pulmo and Falso. C.L.S.

SAN LUIS, Argentine Republic, a central-western province, bounded north by La Rioja, east by Cordova, south by El Pampater, and west by Mendoza; area, 28,535 square miles. In the north the country rises in the Sierra de San Luis to a height of 6,500 feet, and in the south sinks to level pampas and dry plains. On the west the province is watered by the Rio Salado, while the Rio Quinto drains the central portion. In the sierra gold and copper are mined to a considerable extent, constituting the most profitable industry of the province; other minerals also exploited are zinc, plumbago, lead, iron pyrites and sulphur, while porcelain clays and rock salt occur as marketable products. Irrigation is extensively adopted for agricultural purposes, corn, wheat and clover being raised, the latter for stock-feeding purposes; cattle are largely exported. San Luis, the capital, and Villa Mercedes, connected with the South American railroad systems, are the chief towns. Population, 99,380. C.L.S.

SAN LUIS, town in Pampanga, Luzon, Philippine Islands, 9 m. E. of Bacolor. Pop. 10,067.

SAN LUIS OBISPO, a city and the capital of San Luis Obispo County, in S. W. California, on the Pacific Coast and the S. P. railroads, about 90 m. N. W. of Santa Barbara, and 8 m. from the Pacific Ocean. It is the trade center of a rich mining, agriculture and grazing district. Bituminous rock is quarried for pavements. Population, 1890, 2,995; 1900, 3,021.

SAN MARCOS, Texas, the seat of Hays County, a town 30 miles southwest of Austin, on the San Marcos River, the San Antonio division of the International & Great Northern railroad, and the terminus of a branch of the Missouri, Kansas & Texas system. The U. S. Government maintains a fish culture station here, and among the educational establishments is the Coronal Institute. It is a market town, exporting corn, cotton and cattle. Pop., 1900, 2,292. C.L.S.

SAN MIGUEL, Salvador, an interior town and departmental capital, on the San Miguel River, 9 miles northeast of San Miguel volcano (5,950 feet high), and at the junction of trade routes leading from San Salvador, the capital, 70 miles northwest, to the seaports of La Union on the Gulf of Fonseca and to Jucuaran, on the Pacific Ocean. It is an important market town, noted for its fairs. Population, 24,768. C.L.S.

SAN MIGUEL DE ALLENDE, a town in the state of Guanajuato, central Mexico, situated on the Mexican National railroad, 34 miles N. of Ceyala. Has a telegraph station, dominion express and a college. Population, 15,000.

SAN MIGUEL DE MAYUMO, town in Bulacan, Luzon, Phil. Is. Products abundant. Pop., 14,919.

SAN PABLO, town in S. Central Laguna, Luzon, Phil. Is., 25 m. S. of Santa Cruz, in area of volcanic elevations and lakes and supposed valuable mineral deposits. Population, 22,612.

SAN RAFAEL, California, the seat of Marin County, a city and health resort on the northwest coast of San Francisco Bay, near San Pablo Strait, 15 miles north of San Francisco city, with which it has frequent connection by rail and the San Quentin ferry. It is on divisions of the California Northwestern and the North Pacific Coast railroads, and exports the products of an agricultural section, with cattle-breeding, dairying, milling and lumbering interests. Population, 1890, 3,290; 1900, 3,879. C.L.S.

SAN SABA, a town and the capital of a county of

the same name, central Texas, on the San Saba River. Its railroad station is Lometa, on the Gulf, Colorado and Santa Fé railroad. The surrounding country is devoted to farming and stock-raising. Population, 1900, 750.

SAN SALVADOR OR NUEVA SAN SALVADOR, the capital of the Central American republic of the same name, an interior city 50 miles by rail northeast of the Pacific seaport town of Acajutla, and 26 miles north of Libertad, the nearest Pacific port, from which a railroad also is projected to the capital. The city is situated south of the volcano of San Salvador, between wooded heights, 2,900 feet above sea-level, in the valley of a small river flowing to the Pacific. Founded by Jorge Alvarado in 1528, the city suffered from disastrous earthquakes in 1539, 1854, 1873, 1879 and 1891, and now occupies a position 20 miles south of the original site, and 7 miles southwest of the second city, built after 1539, and which, when destroyed in 1854, had handsome public buildings and residences and over 25,000 inhabitants. The buildings of the new city are of wood and do not exceed two stories in height. San Salvador has manufactures of iron ware and cotton goods, and is the gathering and distributing center of an agricultural region, with sugar and indigo as the chief products. Population of city and Federal district, 59,540. C.L.S.

SAN SALVADOR ISLAND. See COLUMBUS, Vol. VI, p. 155.

SANT, JAMES, an English painter; born in Croydon, April 23, 1820. He received most of his instruction at the Royal Academy; was made a member of the Royal Academy in 1870, and in 1871 principal painter in ordinary to the Queen. Among his most widely known works are the *Infant Samuel; Little Red Riding-Hood; Dick Whittington; Retrospection; Saxon Women*, and the *Miller's Daughter*. For the Countess of Waldegrave he painted 22 portraits of members of her circle, including the Duchess of Sutherland, Lady Constance Grosvenor, the Duchess of Wellington and Earl Grey. He was commissioned to paint a large portrait of the Queen and the three eldest children of the Prince of Wales and another portrait of the Queen for the Turkish embassy.

SANTA ANA, California, the seat of Orange County, a city 35 miles southeast of Los Angeles, and 10 miles northeast of Newport Beach on the Pacific, at a junction of the Southern California and the Southern Pacific Company railroads. It is an important citrus-fruit growing center with a large export trade, and numerous industrial establishments, including wineries, lumber mills, machine works, etc. Population, 1890, 3,628; 1900, 4,933. C.L.S.

SANTA ANA, Salvador, an interior town and departmental capital in the west of the republic near the Gautemala boundary 11 miles north of the active volcano of Lematepec or Santa Ana (7,900 feet high) and 36 miles northwest of San Salvador, with which it is connected by rail as also with the seaport town of Acajutla on the Pacific Ocean, 50 miles to the south. Santa Ana is an educational center with a state university and a female college, and is in a sugar-growing and mining region exporting silver, copper, zinc and iron. Population, 48,120. C.L.S.

SANTA BARBARA, California, the seat of a county of the same name, a seaport city on the Pacific Ocean and on a division of the Southern Pacific Company railroad, 280 miles southeast of San Francisco and 110 miles northwest of Los Angeles, with which and other Pacific ports it has periodical steamer connection. It has a good harbor and bathing beach and the city which grew up around the well preserved and picturesque Spanish mission founded here in 1780, occupies a healthful situation on a gentle coastal slope at the foot of the Santa Ynez Mountains. It is a noted summer resort, especially for the inhabitants of San Francisco, and its sulphur and other medicinal springs attract health seekers. The citrus-fruit and flower-growing industries are extensive. Population, 1890, 5,864; 1900, 6,587. C.L.S.

SANTA CLARA, a thriving town of western California, charmingly situated in the fertile Santa Clara valley, in Santa Clara County, on the Southern Pacific railroad, about 3 miles W. of San José and 45 miles S. of San Francisco. The town has an extensive distillery and winery, a large tannery and manufactures of windmills. It is the seat of Santa Clara College, a Catholic institution, and of the University of the Pacific, at College Park, one mile from the town, a Methodist Episcopal institution established in 1851, and having, in 1901, 12 instructors, 247 students, and a library of 5,000 volumes. Population, 1890, 2,891; 1900, 3,650.

SANTA CRUZ, California, the seat of a county of the same name, a city of the Pacific coast, on the north shore of Monterey Bay, and the terminus of two divisions of the Southern Pacific Company railroad 80 miles south of San Francisco, with which it has regular passenger and freight steamer connection as also with all prominent coast ports. It is one of the celebrated summer and winter resorts of the "Golden State" and the commercial and manufacturing trade center of the neighboring fruit, vine, and cattle-farming region which has also valuable commercial deposits of bitumen. Its manufacturing establishments include gunpowder works, tanneries, lumber, borax, soap and glue factories. Population, 1890, 5,596; 1900, 5,659. C.L.S.

SANTA CRUZ, ANDRES DE. See PERU, Vol. XVIII, p. 692.

SANTA CRUZ DE SANTIAGO. See CANARY ISLANDS, Vol. IV, p. 706.

SANTA CRUZ ISLANDS. See NEW HEBRIDES, Vol. XVII, pp. 405, 406.

SANTA FÉ, the capital and largest city of the territory of New Mexico. (For general geographical and historical article, see SANTA FÉ, Vol. XXI, pp. 310, 311.) It is annually increasing and extending, and is an important military post. Within late years the old city of adobes has given place to a new city with all the modern appointments. It is the seat of Romona School, for Indian girls; Presbyterian Academy, established in 1881; St. Michael's College, a

Roman Catholic institution established in 1859, and having 12 instructors and 175 students in 1890. The most important industries are stock raising and mining. There are also deposits of kaolin and clay in the vicinity. Population, 1890, 6,185; 1900, 5,603.

SANTALACEÆ, a family of parasitic shrubs. See PARASITISM, Vol. XVIII, p. 270.

SANTAL-WOOD OR SANDERS-WOOD. See SANDALWOOD, Vol. XXI, p. 268.

SANTA MARIA, DOMINGO, a Chilian jurist; born in Santiago, Chile, August 4, 1825. He studied law, entered politics and was exiled in 1852. On his return he was Minister of the Treasury in 1863 and was appointed Judge of the Supreme Court in 1867. In 1874 he was made president of the Court of Appeals. In 1881 he was elected president of the Republic, and in 1886 was again made president of the Court of Appeals. He died in Santiago, June, 1890. W.M.C.

SANTA MARIA DI CAPUA. See CAPUA, Vol. V.

SANTA MARTA, Colombia, the capital of the department of Magdalena, a seaport city at the northeastern extremity of the entrance to the Cienaga de Santa Marta, a shallow lagoon on the Caribbean Sea. Founded by Spaniards in 1525 it was frequently attacked by Indians and by French and English buccaneers. It is the terminus of a railroad projected past San Juan de la Cienaga on the southeast to join at Calamar on the Magdalena with the railroad to Cartagena and exports the products of the region. It has beautiful surroundings, with the Sierra Nevada de Santa Marta on the S.E. Pop., 4,000. C.L.S.

SANTA MONICA, California, a city and seaside resort on Santa Monica Bay, an indentation of the Pacific in Los Angeles County, 17 miles by steam and electric railroads west of Los Angeles. It is the terminus of a branch of the Southern California railroad, and is on a division of the Southern Pacific Company system, which has a wharf here a mile long. Santa Monica is a progressive town with a fine beach, and beautiful homes, sheltered on the north by the Santa Monica mountains. Adjoining the town on the south is the large summer colony of Ocean Park. Population, 1890, 1,580; 1900, 3,057. C.L.S.

SANTANDER, FRANCISCO DE PAULA (1792–1840), a patriot-soldier, lieutenant to Bolivar; refugee in 1828–31; President of New Granada 1832–37. See also BOLIVAR, Vol. IV, pp. 9–10.

SANTA PAULA, California, a township of Ventura Co., organized since 1890 from part of Saticoy twp., 65 miles N.W. of Los Angeles, on the Santa Barbara branch of the Southern Pacific Company railroad. It is a town of varied interests; its scenic beauties and sulphur springs attract numerous visitors and health seekers and it is the trade center of the Santa Clara valley with citrus-fruit, bean-growing and honey-producing interests, and petroleum wells, asphalt, lumber and stone quarries. Pop., 1900, 3,583. C.L.S.

SANTAREM, MANUEL FRANCISCO DE BARROS E SOUSA, VISCOUNT OF (1791–1856), a Portuguese courtier and historian who lived 23 years in Paris, and died there. See PORTUGAL, Vol. XIX, p. 556.

SANTA ROSA, California, the seat of Sonoma County, a city and railway junction 50 miles north of San Francisco on two divisions of the California Northwestern railroad, and terminus of a branch line of the Southern Pacific Company system. It lies in a well watered and productive valley near the convergence of two ridges of the coast range, and is the commercial center of a farming, fruit, grape, flower-growing and wine-manufacturing region. Population, 1900, 6,673. C.L.S.

SANTA ROSALIA, Mexico, a city in the state of Chihuahua at the confluence of the Nonoava and Conchos rivers, and on a division of the Mexican Central railroad, 90 miles southeast of Chihuahua. It is a river port, market town, and health resort, frequented for its hot sulphur springs. Population, 8,000. C.L.S.

SANTEE, a navigable river of South Carolina, flowing into the Atlantic through two outlets, near the southern boundary of Georgetown County, 20 miles south of Georgetown. It is formed by the junction of the Congaree and Wateree rivers at Congaree, 110 miles above its outlets. C.L.S.

SANTI, GIOVANNI. See RAPHAEL, XX, 286.

SANTIAGO DE CUBA. See Vol. XXI, 314. For a full account of the siege and capture of the city by the American troops under Gen. Shafter (June–July, 1898), and of the naval battle off the harbor, between the American and Spanish fleets, July 3, 1898, see UNITED STATES, in these Supplements. The surrender to Gen. Shafter (July 17, 1898) included not only the city, but also the eastern part of the province of Santiago de Cuba. On July 20, Brig.-Gen. Leonard Wood was appointed military governor of the city, and on Oct. 7 of the province also; and he speedily effected a marvelous improvement in its sanitary condition and in the enforcement of order and good government. The streets were policed, cleanliness was enforced, public schools were established, roads to Holguin and Guantanamo were begun, and the government buildings, arsenals, and regimental quarters were remodeled, repaired and refurnished. On Oct. 21 he issued a proclamation providing for the enforcement of the principles of civil and religious liberty and of justice; and on Dec. 2 he installed the supreme court, reorganized and composed of Cubans. In March, 1899, it was reported that the city was rapidly becoming Americanized, and had several American hotels and restaurants, an American bank, 2 American express companies, a meteorological station, a free postal delivery system, with drop boxes for letters, and mails two or three times a week to the towns and villages throughout the province. Pop. of province, 1900, 327,715.

SANTIAGO DE LOS CABALLEROS, Haiti, a town of the Republic of Santo Domingo, on the Yaqui del Norte River, 30 miles by rail from Puerto Plata northward on the Atlantic, and 85 miles from Santo Domingo city on the south coast. It is a healthful hill town, and a tobacco-growing center. Population, 10,000. C.L.S.

SANTO DOMINGO, REPUBLIC OF. See HAYTI, in Vol. XI, p. 487, and in these Supplements.

SANTONIN, a white crystalline substance obtained from Santonica (German or Levantic wormseed). It is anthelmintic in doses of from one to four grains (.05 to .25 grams.). Sometimes it exerts a peculiar effect on the sight, everything looking as if seen through a yellow glass. Large doses are poisonous.

SANTORIN, an island. Same as THERA, Vol. XXIII, p. 299.

SÃO FRANCISCO RIVER. See BRAZIL, Vol. IV, p. 199.

SAÔNE, a river. See RHONE, Vol. XX, 542.

SAP. See *Absorption*, under PHYSIOLOGY, Vol. XIX, pp. 51–52.

SAPAJOU. See APE, Vol. II, p. 134.

SAPAN-WOOD. See SAPPAN-WOOD, Vol. XXI, p. 317.

SAPODILLA (*Achras sapota*), a tree of the order *Sapotaceæ*, the fruit of which resembles a bergamot pear in shape and size. W.R.B.

SAPONIFICATION. See OILS, Vol. XVII, p. 761.

SAPONIN. See SOAP-BARK, Vol. XXII, 216.

SAPOTACEÆ, a small family of shrubs and trees containing about four hundred tropical species, commonly known as the Sapodilla family. Some genera have excessively hard wood, known as ironwood (*Sideroxylon* and *Bumelia*). The latex of some genera (*Palaquium*, *Mimusops* and *Payenia*) is the raw material of gutta-percha. Several genera bear highly prized berry-like fruits, as sapodilla and star-apple, and the seeds of *Bassia* yield an abundant fatty oil.

SAPPERS. See FORTIFICATION, Vol. IX, p. 403.

SAPROPHYTES, a name given to plants without chlorophyll, which obtain their food from decaying organic material, or from the products of living organisms. Among saprophytes are the well-known mushrooms and toadstools. See also BIOLOGY, Vol. III, p. 597; and BACTERIOLOGY, in these Supplements.

SAP-SUCKER (*Sphyrapicus varius*), a North American bird of the woodpecker family (*Picidæ*), often called the yellow-breasted woodpecker. Like other members of the family, it bores holes in trees; but, unlike the others, this bird is said not to be in search of insect-larvæ, but the sap, which constitutes its food. Some authorities claim that the bird seeks insect-larvæ as well as sap. Sometimes fruit and ornamental trees, especially maple, are injured by the numerous punctures made by this bird.

SAPWOOD. See BOTANY, Vol. IV, p. 89.

SARACENIC ART. See ARCHITECTURE, Vol. II, pp. 389–392.

SARAGOSSA. See ZARAGOSA, Vol. XXIV, p. 808.

SARAGOSSA, MAID OF. See AGUSTINA, in these Supplements.

SARAJEVO. See BOSNA SERAI, Vol. IV. p. 60.

SARAKHS. See PERSIA, Vol. XVIII, p. 629.

SARANAC LAKE, a village of Franklin County, northeastern New York, on the Chateaugay, New York Central and Hudson River, and Saranac and Lake Placid railroads, 40 miles S. of Malone and about 60 miles S.W. of Plattsburg. It is best known as the center of one of the most beautiful regions in the Adirondack Mountains. Three lakes, the Upper, Middle and Lower Saranac lakes, lie near the village, making it a most delightful summer resort. The Adirondack Sanatorium, an institution much visited by persons suffering from pulmonary complaints, is located here. Population 1890, 768; 1900, 2,594.

SARASATE, HIS EXCELLENCY PABLO MARTIN MELITON DE, violinist; was born at Pampeluna, Spain, on March 10, 1844, and was educated at the Paris Conservatoire. He has played at concerts with distinguished success in every country of the civilized world excepting Australia, and has received distinguished decorations from most of the sovereigns of Europe. He is also honorary professor at several conservatories of music. As a violinist virtuoso he ranks among the foremost of his time, and he is also a composer of merit. W.F.J.

SARASWATI. See ALLAHABAD, Vol. I, p. 509.

SARATOGA, BATTLE OF. See UNITED STATES, Vol. XXIII, p. 785; and SARATOGA SPRINGS, in these Supplements.

SARATOGA SPRINGS, a popular inland watering-place of New York state, which has changed little since the account contained under SARATOGA SPRINGS, Vol. XXI, 320–321, was written. It has grown, if anything, more beautiful; its shaded avenues are grander, and the houses of its rich visitants more numerous. With the suppression of its gambling-houses and the cessation of horse-racing, its popularity has, if anything, increased. It is essentially the city of conventions for all learned and prominent societies. Saratoga Lake, distant five miles from the town, has been connected with it by an electric surface railroad, and the lake has become a popular meeting-place for rowing-crews in an annual regatta. The mineral springs described under MINERAL WATERS, Vol. XVI, p. 456, are, if anything, more numerous, and in greater popular favor. It would seem impossible to sink a shaft in the vicinity of Saratoga Springs without discovering some new mineral water, differing slightly in analysis from those already in popular favor. The prevailing character of the waters is cathartic.

Sixteen miles distant, at Schuylerville and Bemis Heights, reached by railroad, driving, or by fine roads for bicycling, rises a magnificent monument in memory of Burgoyne's surrender after the battles of Saratoga. These conflicts took place Sept. 19, Oct. 7, and Oct. 17, 1777. Burgoyne, with his army, was trying to effect a junction with the royalist forces from New York. He crossed the Hudson and attempted to storm the strong American position held by Gates at Bemis Heights. The battle was sanguinary, both British and Americans losing a fourth of the men in action. Then for 18 days nothing was done. News came to Burgoyne that his supplies were cut off. He was forced to again attack the strong position of the American army, though he had but 4,000 men as opposed to 16,000. With 1,500 picked men under Fraser he tried to turn the American flank, and for the second time Benedict Arnold thwarted his plans. Both Fraser

and Arnold were wounded and disabled. On October 17th, Gates, with 20,000 men, followed the retreating army, who found their passage across the Hudson cut off. Burgoyne was unable to hear from Clinton, and accordingly treated with a view to surrender. The terms agreed upon, called the "Convention of Saratoga," permitted the British to march out with the honors of war, lay down their

SARATOGA MONUMENT.

arms, march to Boston, embark for England and not serve against Americans again. The British marched out Oct. 17th, but the terms of the convention were not sanctioned by Congress, and while the officers were paroled the men were kept prisoners for a considerable period. The scene of the battle-ground, with its handsome monument, is a place of popular excursion. Pop. 1900, 12,409.

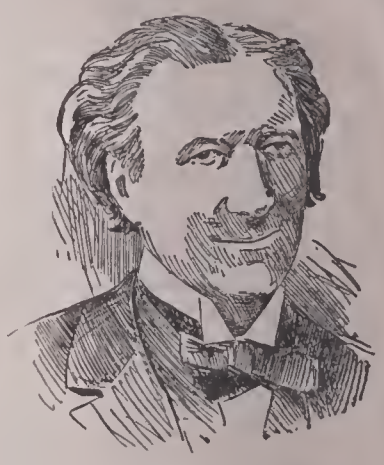
SARAVIA, a town of the Philippine Islands on the N. W. coast of the island of Negros. Sugar culture, the industry. Pop. 13,132.

SARCEY, FRANCISQUE, a French dramatic critic and novelist; born in Dourdan, Oct. 8, 1828; educated at the normal school; first wrote for the *Figaro* and the *Revue Européenne;* in 1859 accepted the post of dramatic critic to the newly-founded *Opinion Nationale*, and in 1867 accepted a similar post on the *Temps*. He published a *History of the Siege of Paris; Comédiens et Comédiennes* (two series, 1876 and 1884); *Souvenirs of My Youth* (1885) and *Souvenirs of My Age* (1892); and *The Theatre* (1893). Died in Paris, March 15, 1899.

SARCOZINE, methyl-amido-acetic acid, obtained by splitting up creatine, or creatinine, or from methylamine and chloracetic acid. It forms rhombic prisms, soluble in water, little soluble in alcohol. It has a sweet taste, and melts at 210° to 215°, with partial decomposition. Taken internally, most of it passes through the system unchanged.

SARDINIA, a former kingdom. By the treaty of Utrecht the house of Savoy added to their extensive possessions the principality of Montferrat and the island kingdom of Sicily. At this time Sardinia was subject to Austria, and in 1720 the latter exchanged Sardinia for Sicily. The title of king, which had gone with Sicily, was, however, retained by the Duke of Savoy and attached to Sardinia. A new kingdom of Sardinia thus came into existence. In 1831 the direct male line of the house of Savoy became extinct, the crown falling to Charles Albert (1831–49), the head of the branch Savoy-Carignano, founded by a younger son of Charles Emmanuel, Thomas Francis, born in 1596. King Charles abdicated his throne March 23, 1849, in favor of his son, Victor Emmanuel II. By the peace of Zurich, Sardinia obtained Lombardy, with the exception of Mantua, part of the papal states and the duchies of Parma and Modena. In 1860 Parma, Modena, the Romagna, Tuscany, Sicily, Naples, Marche and Umbria joined Sardinia. In this year Savoy and Nice were ceded to France. March 17, 1861, Victor Emmanuel was declared king of Italy. The remaining part of Lombardy and Venetia was added in 1866, and the papal states (Province of Rome) were taken possession of Sept. 20, 1870, and annexed. For the merging of Sardinia into the kingdom of Italy, see ITALY, Vol. XIII, pp. 499–500; and SAVOY, Vol. XXI, p. 358.

SARDOU, VICTORIEN, dramatist; was born in Paris on September 6, 1831, and in early life studied for the medical profession. His tastes led him to the theater, and he essayed dramatic composition. His first play, a comedy, was not successful, but he persisted and soon won for himself an assured place in the dramatic world. For many years he has been the most successful writer of "emotional" and "problem" plays in France. His early works included *Les Premières Armes de Figaro* (1859); *Monsieur Garat* (1860), and *Les Prés-St.-Gervais* (1862). His first brilliant success was *Les Pattes de Mouche* (1860), which was closely followed by the even more popular *Nos Intimes* (1861). Other noteworthy pieces have been *Patrie* (1869), a patriotic play; *Rabagas* (1872), which was supposed to refer to Gambetta; *L'Oncle Sam* (1873), a satire on America; *Dora* (1877); *Daniel Rochat* (1880); *Odette* (1881); *Divorçons* (1881); *Madame Sans-Gêne* (1895), and *Robespierre* (1902). He wrote for Sarah Bernhardt a number of striking dramas, which comprise *Fédora* (1882); *Théodora* (1884); *La Tosca* (1887), and *Cleopatra* (1890). Other of his plays are *La Taverne* (1854); *Les Gens Nerveux* (1859); *Candide* (1862); *La Famille Benoiton* (1865); *Belle Maman* (1889); *Thermidor* (1891); *Pamela* (1898); *Dante* (1903); *Les Ganaches* (1861); *Les Vieux Garçons* (1865);



VICTORIEN SARDOU.

Nos Bons Villageois (1866); *Maison Neuve* (1866); *Gismonda* (1894); *Spiritisme* (1897), and *La Haine* (1874). His *Thermidor*, a play of the French Revolution, excited great enthusiasm, but was soon suppressed by the government for political reasons. Many of his pieces have been translated into English and have been performed in the United States, especially by the late Fanny Davenport (q. v., in these Supplements). His style is usually brilliant, but essentially artificial and superficial, so that while his plays have the elements of popularity they give little promise of becoming classics. He was decorated with the Legion of Honor in 1863, and was elected a member of the French Academy in 1877. W.F.J.

SARGENT, Aaron A., an American public man; born in Newburyport, Mass., Sept. 28, 1827. He learned the printer's trade; removed to California in 1849; studied law; and in 1854 was admitted to the bar. He was district attorney for Nevada County, Cal., 1855–56; sat as a Representative in Congress from California from July 4, 1861, to March 3, 1863, and from March 4, 1869, to March 3, 1873; was elected Senator as a Republican in the place of Cornelius Cole, and served from March 3, 1873, to March 3, 1879. In 1882 he was appointed minister to Germany, by President Garfield, but later resigned his office on account of the action of the German government in excluding American pork from the empire, making his incumbency personally distasteful. He was offered the Russian mission, but declined it. He died in San Francisco, Cal., Aug. 14, 1887. E.E.T.

SARGENT, Charles Sprague, arboriculturist; was born in Boston on April 24, 1841, and was graduated from Harvard College in 1862. He served in the Civil War as an officer of Massachusetts troops. In 1873 he became director of the Arnold Arboretum and in 1879 also professor of arboriculture at Harvard. He planned the Jesup collection of North American woods for the American Museum of Natural History, was chairman of the commission for the preservation of the Adirondack forests, and of the commission appointed by the National Academy of Sciences to formulate a forest policy for the United States, was editor of *Garden and Forest* in 1887–97, and has written several important treatises and reports upon forestry. W.F.J.

SARGENT, Epes, man of letters; was born at Gloucester, Massachusetts, on September 27, 1813, and was a journalist, poet, novelist, and dramatist, and editor of literary works. Among his best known works are *Change Makes Change*, a comedy; *The Priestess*, a tragedy; *Wealth and Worth*, a novel; *Peculiar: A Tale of the Great Transition; A Life of Henry Clay; Songs of the Sea; A Cyclopædia of English and American Poetry*, and *Sargent's Stanaard Speaker*, the last a notable collection of prose and verse for reading and reciting. His song *A Life on the Ocean Wave* is familiar the world around. He died in Boston on December 31, 1880. W.F.J.

SARGENT, John Singer, artist; was born at Florence, Italy, on January 12, 1856, the son of American parents, and was educated in Europe, studying art under Carolus Duran and other eminent masters. His first picture at the Salon was *Going Fishing*, in 1878. In 1884 he settled in London; he visited New York in 1887, and received orders for many portraits; in 1892 he joined Edwin Abbey and worked with him on some large decorative works, and in 1894 created a furore at the Royal Academy in London by his exhibition of those works. In recent years he has devoted himself chiefly to portrait work; has painted many pictures of public men and social leaders, and in that important department of art is regarded by both European and American critics as having probably no superior, if, indeed, any equal, in the world. He has received many medals and prizes, and has been elected to associate membership in the Royal Academy, the Societe des Beaux Arts, etc., and is an officer of the Legion of Honor. W.F.J.

Copyright, 1903, by J. E. Purdy.

JOHN S. SARGENT.

SARGENT, Winthrop, lawyer and historian; was born in Philadelphia, Pennsylvania, on September 23, 1825, practiced with success at the bar, spent most of his life in New York city, and wrote a number of historical works, including a highly esteemed *History of an Expedition Against Fort Duquesne in 1755 Under General Braddock* (1855), and *The Life and Career of Major John André* (1861). He also wrote *The Loyalist Poetry of the Revolution*, and edited the compilation made in it. He died in Paris on May 18, 1870. W.F.J.

SARGON, King. See Babylonia, Vol. III, p. 162.

SARMIENTO, Domingo Faustina (1811–1888), President of the Argentine Republic. See Argentine Republic, Vol. II, pp. 16, 17.

SARMIENTO DE GAMBOA, Pedro. (1530–1589.) See Patagonia, Vol. XVIII, p. 358.

SARNIA, a city and port of entry, and the capital of Lambton County, southwestern Ontario, Canada, on the St. Clair River opposite Port Huron, with which it is connected by ferry, and on the Grand Trunk and the Erie and Huron railways, at the Canadian end of the tunnel under the St. C air River, about 60 miles W. of London. It is situated in a region having important lumber, petroleum and agricultural interests. The principal industries of the city are woolen and planing mills, foundries, machine-shops, breweries, tanneries, etc. Sarnia is a stopping-place for vessels bound for the northern lakes, and has a large shipping-trade. Point Edward, formerly Port Sarnia, is now within the city limits. Population, 1891, 6,693; 1901, 8,176

SARONY, Napoleon, an American photographer; born in Quebec, Canada, in 1821. He learned the printing trade and in 1846 removed to New York and became well known as a lithographer. In 1865 he returned from a long residence abroad and opened a studio and in the next twenty years won wide celebrity as a photographer; especially in making portraits of theatrical notables. He died in New York city, November 9, 1896. W.M.C.

SARRACENIA. See Insectivorous Plants, Vol. XIII, p. 144.

SARSFIELD, Patrick, Earl of Lucan, an Irish Jacobite; born in Ireland in 1645. He entered the army and was made a colonel in 1686. He supported the cause of James II in Ireland, and as a reward was created Earl of Lucan. He participated in the battle of the Boyne (1690), drove the English out of Sligo, fought the principal engagements of the war, and was in command of the Irish forces at the defense of Limerick. In October, 1691, he surrendered with his force to General Guickel; and by the terms of surrender was allowed to cross over to France where he had charge of a large party of Irish volunteers. After the battle of May 19, 1691, he gave his services to France. He fought at Steenkirk, August 3, 1692, and was killed in the battle of Louden, August 19, 1693. W.M.C.

SARTAIN, John, an American artist; born in London, England, October 24, 1808. He learned the engraving art and removed to the United States in 1830. He was one of the first to introduce mezzotint engraving. In 1843 he became proprietor and editor of *Campbell's Foreign Magazine* and in 1848 purchased an interest in the *Union Magazine*, afterward called *Sartain's Union Magazine*. He held various offices in the Artists' Fund Society, the School of Design for Women, and the Pennsylvania Academy. In 1876 he had charge of the art department at the Philadelphia Centennial Exposition. He engraved a large number of book illustrations and many historical paintings, including Rothermel's *Battle of Gettysburg* and *The Iron Worker and King Solomon*. He designed the monument to Washington and Lafayette in Monument Cemetery, Philadelphia. He died in Philadelphia, October 25, 1897. W.M.C.

SASKATCHEWAN, a large important river of Canada, which draws its waters from the Rocky Mountains, and is formed by two head-waters called the South Branch, or Bow River, and the North Branch. The South Branch issues from a lake about four miles long, fed by a glacier descending from a magnificent *mer de glace*. A few yards north is another group of springs from which the North Branch takes its rise. The height above the sea is 6,347 feet. The South Branch flows southeast to its junction with the Belly River, then northeast to its junction with the North Branch. The North Branch flows north past Mount Murchison, through Kutanie Plain, in a general eastern direction to its confluence with the South Branch, and falls into Lake Winnipeg.

SASKATCHEWAN, a province of Canada, formed from the provisional districts of the Northwest Territories and admitted to the Union on Sept. 1, 1905. The area is 250,650 and the population was in 1901, 91,460, in 1906, 257,000. The wheat crop in 1906 amounted to 50,182,359 bushels from 2,117,484 acres. In 1905 there were 80 establishments with 1,444 employees, a capital of about $4,000,000, and products valued at $2,520,170.

SASSAFRAS, a genus of trees or shrubs of the family *Lauraceæ*, having diœcious flowers, a six-parted membranous perianth, nine stamens, a succulent fruit placed on the thick fleshy apex of the fruit-stalk, and surrounded by the unchanged perianth. The sassafras tree (*Sassafras officinalis*) is found from Canada to Florida, has deciduous leaves, yellow flowers which appear before the leaves, and small dark-blue fruit. The wood is soft, light, coarse in the fiber, dirty white and reddish brown, with a strong but agreeable smell resembling that of fennel, and an aromatic, rather pungent and sweetish taste. An oil which is fragrant and essential is extracted from the root.

CARDINAL SATOLLI.

SATOLLI, Francesco, a Roman Catholic prelate and diplomat; born in Perugia, Italy, July 21, 1831. He was educated at the Diocesan Seminary of Perugia under the instruction of Archbishop Pecci. When the latter became Pope

he appointed Satolli professor of dogmatic theology in the Roman Seminary and School of the Propaganda. In 1888 he was created Archbishop of Lepanto, and in 1892 when new questions arose in the United States he was sent out as Papal Ablegate with plenary power, which was confirmed by his appointment in January, 1893, as permanent apostolic delegate to the American Church, with an official residence in Washington. He has written several valuable works, *A Commentary on Saint Thomas Aquinas* and *A Course in Philosophy*, largely used in Catholic institutions of learning. He was elevated to the cardinalate in 1895, and was recalled and succeeded by Archbishop Sebastiano Martinelli in 1896.

W.M.C.

SATOW, Sir Ernest Mason, an English scholar and diplomat; born in London, June 30, 1843. He was graduated from University College, London, in 1869, and in 1887 was made a barrister at Lincoln's Inn. He then entered the British consular service and after serving as minister in Tangier was sent to Japan. Here he began his researches into the Japanese language, literature, history, religion and archæology. He was made Japanese secretary to the British Legation and received the decoration of St. Michael and St. George. He was transferred to Siam as consul-general in 1883, and became minister there in 1885. In 1888 he was sent as minister resident to Montevideo, and in 1893 was sent to Morocco as envoy extraordinary and minister plenipotentiary. In 1895 he was sent to Japan, and in 1900 after the "Boxer" uprising, he was transferred to Pekin. He has written on Japanese affairs, and is one of the authors of *Murray's Guide to Japan*. W.M.C.

SATRAP. See Persia, Vol. XVIII, p. 581.

SATSUMA, Japan, a part of Kagoshima Ken, Kiusiu island, a former peninsular province, famous for its porcelain. See Japan. C.L.S.

SATURDAY. See Mary, Vol. XV, p. 599.

SATURN, a planet. See Astronomy, Vol. II, pp. 684, 709–710, and in these Supplements. In March, 1899, a new satellite, the ninth, was discovered by W. H. Pickering, at the Harvard Observatory, Arequipa, Peru; it is 3½ times as far from Saturn as Iapetus, the outermost satellite theretofore known; has a period of about 17 months; and when discovered had a magnitude of 15½.

SATURNALIA, a festival. See Saturn, Vol. XXI, p. 336.

SATYR DRAMA. See Drama, VII, 350–351.

SAUGERTIES, a village of Saugerties township, Ulster Co., N. Y., on the west bank of the Hudson river, opposite Tivoli, with which it is connected by ferry, and on the West Shore railroad, 12 miles N. of Kingston. The river furnishes water-power for large paper-mills and factories of iron, brick, and paper goods. Pop. 1900, 3,697. The township is devoted to agriculture, and has important limestone quarries; pop. 1900, 9,754.

SAUGOR. See Sagar, in these Supplements.

SAUGUS, a township of Essex Co., Mass., on Lynn Harbor, intersected by the Boston and Maine railroad, 10 miles N.N.E. of Boston, contains the villages of Saugus, East Saugus, Pleasant Hill, and Cliftondale. The first named is the most important, and has factories of boots, shoes, and flannels. Population of the town, 1900, 5,084.

SAUK CENTER, Minnesota, a city of Stearns County, on the Sauk River, and an important junction of divisions of the Great Northern and the Northern Pacific railroads, 40 miles northwest of Sauk Rapids and St. Cloud, and 108 miles northwest of St. Louis. It is the market town of a farming and stock raising region and has grain elevators, flour mills, and other industrial establishments. Population, 1890, 1,695; 1900, 2,220.

C.L.S.

SAUK RAPIDS, Minnesota, the seat of Benton County, a village on the east bank of the Mississippi River, opposite the mouth of the Sauk River and St. Cloud, 65 miles northwest of St. Paul. It is on the St. Paul and Fargo division of the Northern Pacific railroad, just north of the railway junction of East St. Cloud, and has an export trade in the products of its dairy, flour-milling and lumbering industries. Population, 1890, 1,185; 1900, 1,391. C.L.S.

SAULCY, Louis Félicien Joseph Caignart de, a French historian, Orientalist and antiquarian; born in Lille, March 19, 1807. He was educated at École Polytechnique, and in 1838 became professor of mechanics at Metz, and in 1842 was appointed conservator of the museum of artillery at Paris. His studies were mainly devoted to numismatics and archæology. In 1842 he became a member of the French Academy, having previously been awarded numismatic and other prizes. In 1859 he became a senator and later made extensive journeys in search of antiquities. He visited Iceland and Greenland in 1864, and Syria, Palestine and the Holy Land in 1870. His many works include *Essai de Classification des Suites Monetaires Byzantines* (1836); *Recherches sur la Numismatique Punique* (1843); *Recherches sur la Numismatique Judaïque* (1854); *Voyage en Terre-Sainte* (1865); *Sept Siècls de l'Histoire Judaïque* (1874), and *Histoire des Machabees* (1880). He stood pre-eminent among French Orientalists. He died in Paris, France, November 4, 1880. W.M.C.

SAULT STE. MARIE, Michigan, the seat of Chippewa County, a city on the west bank of St. Marys Strait, at the foot of the rapids, a short distance below Whitefish Bay and the outlet of Lake Superior. It is the terminus of divisions of the Duluth, South Shore & Atlantic, and of the Minneapolis, St. Paul & St. Marie railroads, 365 miles northwest of Detroit. An immense international railway bridge spans the rapids, connecting with the Canadian town of Sault Ste. Marie, and with the Canadian Pacific railway, while the celebrated St. Marys canal (see Canal), built by the U. S. Government at a cost of $10,000,000, around the rapids, facilitates navigation between the lakes, over 18,000 vessels passing through the American canal annually. The city has many fine buildings, a military garrison, large

electric power works, utilizing the rapids, lumber, machinery, foundry, fishery, and other industries. Population, 1900, 10,538. C.L.S.

SAULT STE. MARIE, Ontario, a town and port of entry in Algoma district, terminus of the Sault Ste. Marie and Goulais branch of the Algoma Central railroad, and of the Sudbury Junction and Sault Ste. Marie division of the Canadian Pacific system opposite Sault Ste. Marie, Michigan, 420 miles northwest of Toronto. It is the see of Anglican and Catholic dioceses, is a frequented summer resort, and carries on a transit trade by the Canadian Sault Ste. Marie canal built by the Dominion Government and opened in 1895. Population, 1901, 7,169. See CANAL, Vol. XXVI, pp. 40–46. C.L.S.

SAUMAISE. See SALMASIUS, Vol. XXI, pp. 230, 231.

SAUNDERS, FREDERICK, an American author and librarian; born in London, England, August 14, 1807. He removed to the United States in 1837 and was librarian of the Astor Library, New York, from 1859 to 1896. He wrote *Memoirs of the Great Metropolis* (1852); *Salad for the Solitary* (1853); *Salad for the Social* (1856); *Mosaics* (1859); *Festival of Song* (1866); *Pastime Papers* (1885). He died in New York city, December 12, 1902. W.M.C.

SAURURÆ. See BIRDS, Vol. III, p. 605.

SAURY OR SAURY PIKE OR SKIPPER, names given to certain members of the family *Scombresocidæ*, placed by Prof. Cope in the spiny-finned group and classified by Dr. Günther as belonging to the tube-bladdered fishes. The jaws are extended into a long, slender beak; the rays of the dorsal and anal fins are completely joined by membrane; and behind these fins are a number of small finlets. The body is smooth and covered with small scales. R.W.C.

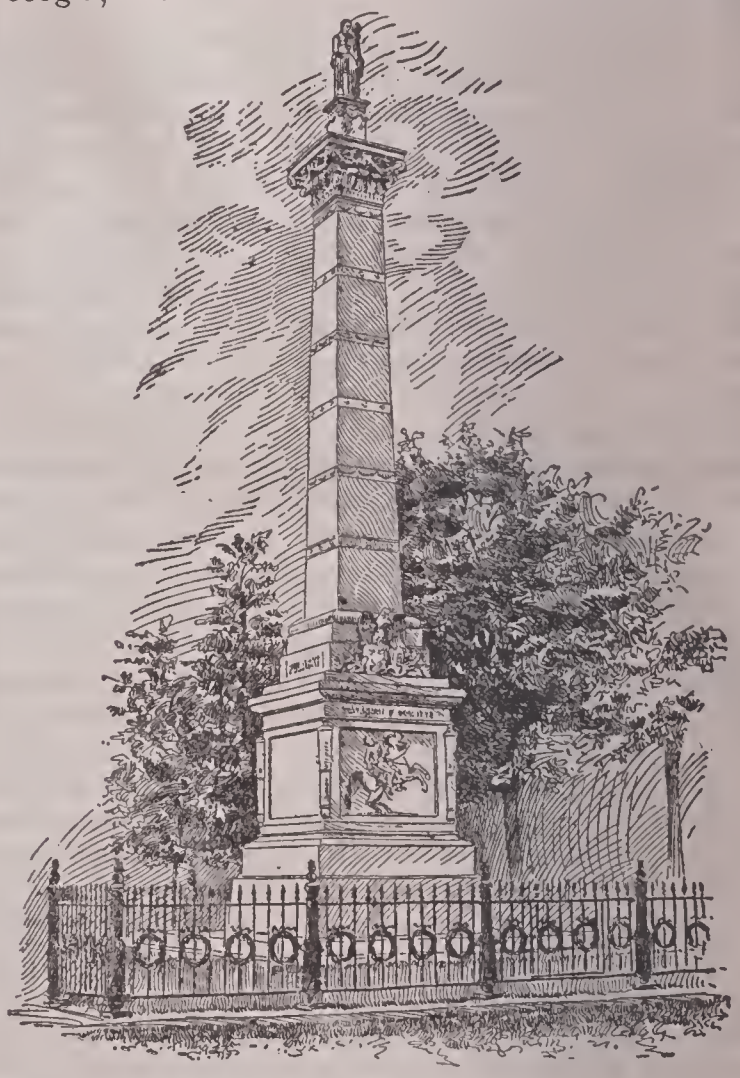
SAUSALITO, California, a town of Marin County, on the northern shore of the Golden Gate entrance to San Francisco Bay, the terminus of the Sausalito and Cazadero division of the North Pacific Coast railroad. A steam ferry across the Golden Gate communicates with San Francisco six miles to the south, and the town is a favorite bathing, boating, yachting and fishing resort. It exports the products of a farming, stock-raising, dairying and market-gardening region. Population, 1890, 1,334; 1900, 1,628. C.L.S.

SAVAGE, MINOT JUDSON, an American clergyman and author; born in Maine, June 10, 1841. He was graduated from Bowdoin College; entered the ministry; became a Unitarian in 1873 and in 1896 was appointed to the Church of the Messiah, New York. He has published *The Religion of Evolution* (1876); *Life Questions* (1879); *The Morals of Evolution* (1880); *Belief in God* (1881); *My Creed* (1887); *Jesus and Modern Life* (1893); *Life Beyond Death* (1899), and *Out of Bethlehem* (1903). W.M.C.

SAVAGE STATION, a battle occuring during McClellan's peninsular campaign, June 29, 1862. Magruder of Lee's army came upon Sumner and Heintzelman retiring toward Savage Station, and an engagement immediately took place. Sumner's corps succeeded in barring the road into White Oak Swamp until evening, when the Union army retired into the swamp.

SAVANNA, Illinois, a city of Carroll County, on the east side of the Mississippi River, above the mouth of Plum Creek, 138 miles west of Chicago, and a converging point for six lines of the Chicago, Milwaukee & St. Paul, and three lines of the Chicago, Burlington & Quincy railroads. Steamers connect with various river ports, and promote the exports of its farming, lumbering and manufacturing interests. Population, 1890, 3,057; 1900, 3,325. C.L.S.

SAVANNAH, the capital of Chatham County, Georgia, the northern terminus of the Savannah,



PULASKI MONUMENT, SAVANNAH.

Florida and Western, the southern terminus of the Charleston and Savannah and the eastern terminus of the Georgia Central railroads. In addition to the transportation accommodations thus furnished, the city is in almost daily communication by steamship and sailing-vessels with other cities of the United States and with Europe. Savannah in 1900 was the third largest cotton-shipping port in the United States, and, according to the returns of the year mentioned, had 42 industries in 115 establishments, employing $5,716,491 in capital and having an annual product of $6,461,816. The manufactories embrace iron foundries, saw and planing mills, rice and flour mills, cotton-compresses, paper and cotton mills, furniture, ice, sash, door and blind factories. The harbor opposite the city is one of the most acces-

sible and commodious along the Atlantic Coast. The chief articles of export are cotton, rice, naval stores and lumber, their value for 1893–94 being over $25,000,000. Savannah is the seat of a Roman Catholic bishopric, and has 41 churches for both white and colored of the various denominations; possesses a good public-school system, contains several public libraries, numerous charitable institutions, has three daily and seven weekly newspapers and a monthly periodical. One of the most prominent objects of interest in the city is the classic Pulaski monument, the corner-stone of which was laid by Lafayette in 1824. It was completed in January, 1855. (See PULASKI, CASIMIR, in these Supplements). The city in 1895 had two national banks, with combined capital of $800,000, six state banks capitalized in the aggregate at $2,250,000, a private bank, safe and trust company, and several loan associations. It is lighted with gas and electricity, furnished with water from 25 artesian wells, and has a paid police and fire department. The assessed valuation of property in the city in 1900 was nearly 40,000,000. Population 1890, 43,189; 1900, 54,244. See also SAVANNAH, Vol. XXI, pp. 339, 340.

SAVANNAH, Missouri, the seat of Andrew County, a city between the Missouri and the One Hundred and Two rivers, on the Chicago, Great Western and the Kansas City, St. Joseph and Council Bluffs railroads, 12 miles north of St. Joseph. It is the market of a farming and fruit-growing region, and manufactures farm implements, flour, feed, wagons, stoves, etc. Population, 1890, 1,288; 1900, 1,886. C.L.S.

SAVANNAH, a town and the capital of Hardin County, western Tennessee, on the right bank of the Tennessee River, about one hundred miles S.W. of Nashville. It has an important trade with the river towns and is a shipping-point for a district abounding in corn, wheat, cotton, live-stock, stone and iron. Population 1890, 1,087; 1900, 1,200.

SAVANNAH RIVER. See GEORGIA, Vol. X, p. 390

SAVE, Austria, an important southern affluent of the Danube which it joins at Belgrade, after a tortuous eastern course of about 550 miles from its sources in the Julian Alps, in the northwest of Carniola. It receives the waters of several other rivers, chief of which are the Drina, the Bosna, and the Kulpa. In its lower course it forms with the Drina the greater portion of the boundary with Servia, and here the Rumer canal makes the river navigable to the confluence of the Kulpa. Railways traverse the valley from its head.

C.L.S.

SAVIN. See JUNIPER, Vol. XIII, p. 784.

*SAVINGS BANKS IN THE UNITED STATES. In his annual report for 1895, the United States Comptroller of the Currency states that up to the 2d of December of that year savings banks to the number of 1,017 had submitted reports of their condition. Of this number, 664 are *mutual* institutions, i.e., associations which are conducted solely for the benefit of the depositors; and 353 are stock savings banks, operated for the benefit of both shareholders and depositors.

The mutual savings banks, with the exception of ten in Ohio, Indiana and Wisconsin, are confined to the Eastern and Middle states, the New England savings banks being nearly all based upon the mutual plan. The loans of the mutual savings banks amounted to $823,036,954; bonds and stocks, $801,044,935; deposits, $1,597,343,160; total resources, $1,756,740,943.

The total loans of all savings banks were $1,035,597,142; bonds and stocks, $841,807,699; deposits subject to check, $33,760,775; savings deposits, $1,810,597,023. The aggregate resources were $2,053,764,328. The resources of the stock savings banks were less than 15 per cent of those of all savings banks.

The report compares these items with those reported in 1894, saying there had been an increase in each, as follows: Loans, $8,659,334; bonds and stocks, $63,219,833; deposits, $66,424,556; total resources, $73,020,139. The number of depositors had increased 97,832, and the average amount due each depositor was increased from $365.86 to $371.36. The interest paid to depositors varied from 3 to 4.5 per cent, the average being apparently a trifle less than 4 per cent.

The steady growth of savings-bank deposits may be seen from a comparison of the present figures with those of preceding years. In 1876 there were 717 savings banks, with total deposits of $879,600,000.

In 1900 the distribution of banks was as follows: In New England 452, with deposits of $963,386,500; 300 in the Eastern states, with deposits of $1,232,325,780; 12 in the Southern states, with deposits of $16,059,553; 75 in the Middle states, with deposits of $218,659,364; and the Pacific states with $170,758,091 deposits.

In the year 1901 the rate of increase continued, the 1,007 savings banks which reported in 1900–01 showing 6,373,098 depositors, with aggregate deposits of $2,601,189,291.

In 1906-7, the number of savings banks were 1,415 with $8,588,811 depositors and $3,690,078,945 deposits. Of foreign countries Germany heads the list with 17,294,217 depositors and $2,831,333,000, while Austria follows (1905) with 5,514,570 depositors and $1,033,183,961 deposits.

This growth, while it applies, in a measure, to nearly all the states, relates chiefly to the Eastern and Middle states, seven states of the middle West, viz., Ohio, Indiana, Illinois, Michigan, Wisconsin, Iowa and Minnesota, and in the extreme West, California. This is largely owing to the fact that the Southern states, and many of those of the West, have failed to provide laws which sufficiently protect deposits in savings banks. The states mentioned have adequate protective laws, although the savings-bank business of California corresponds in character to that of building associations in the Eastern states—the deposits being largely invested in real estate.

The growth, as shown, has been almost uni-

*Copyright, 1897, by The Werner Company.

form and steady, as whatever fluctuations there have been were practically imperceptible until the period of panic and disquiet, which was consequent upon the agitation of the currency question, and which began in 1892. The withdrawals then became quite large, and in the following spring and summer of 1893 they were greatly increased. This withdrawal, although small as compared to the whole deposit, amounted to millions of dollars; but the feeling of distrust gradually became allayed, and by the end of August of that year (1893) the withdrawals had ceased. In 1896 there was another period of distrust, with large withdrawals of deposits, although the amount did not aggregate as heavily as during 1892–93. These later withdrawals began in July, after the National Democratic Convention at Chicago had declared for a change in the financial system of the government, and continued until the day of election, November 3d. Immediately after the election the change in the conditions was so sudden and sharp that a single bank in Chicago reported that in the first week the increase in deposits was at the rate of fully $1,000,000 per month, with an apparent assurance that the deficiency would be more than restored by the early part of 1897. No other political issues or convulsions than those mentioned have ever had any visible effect upon savings-bank deposits.

The investment of the deposits of mutual savings banks is largely confined to United States government bonds, and state, municipal and county bonds, with a limited amount of investment, in some states, in real estate and farm mortgages; the spirit and intention, as well as the strict enactment, of the law being, to keep all investments within such lines as will permit of quick realization of money in order to respond to any call for it. The officials of mutual banks exercise no discretion nor methods of their own, as everything is regulated by the state. They, as well as the trustees by whom they are elected, are merely custodians under the law. The joint-stock banks, doing business for their own profit, have, of course, greater latitude; but the general character of their business is largely regulated by the laws of the state within which they are located. Some of them do a general banking business, with loan and discount and foreign exchange departments, and loan money on such securities as grain and provisions, as well as on stocks and bonds. Their intention, also, is to so place their loans as to stand ready at all times to pay deposits on demand. In the cases of such joint-stock banks as carry on a general, in addition to their savings-bank, business, the security afforded to the savings-bank deposits depends largely upon the nature of the state laws which govern such institutions. Experience shows that savings banks do not attain to any considerable proportions in the states that have failed to enact provisions which demand that safety shall be the first consideration. These provisions, while varying in different states, tend, in one form or another, toward a common end in all the states mentioned, through the requirement of frequent sworn reports, rigid inspection by the state, or the discouraging of heavy loans or investments in real estate or other securities which may not be readily turned.

Law of. As many features which are common to the laws of all the states are contained within the present Savings Bank Law of the State of New York (enacted in 1875), we give here the substance of its provisions:

Savings banks are by this law declared to be corporations possessed of the powers and functions of corporations generally. As such they may have perpetual succession, sue and be sued, complain and defend in any court of law or equity, appoint such officers, managers or agents as the business of the corporation requires, provide for the management of its property and the regulation of its affairs, contract and be contracted with, receive money on deposit and invest the same, and exercise any additional powers incidental to the business of a savings bank. Not less than thirteen persons can organize, each of whom is required to make a written declaration that he will accept the responsibilities and faithfully discharge the duties of a trustee of the institution, if the same shall be authorized by the bank superintendent. This officer has discretionary power in regard to the creating of new banks, being required to determine from the best sources of information at his command, whether greater convenience of access to a savings bank will be afforded to any considerable number of depositors by opening a bank at the place designated, and if the density of the population in the neighborhood and in the surrounding country is such as to afford a reasonable promise of adequate support to the enterprise; and also whether the responsibility, character and general fitness for the discharge of the duties appertaining to such trust, of the persons named as trustees, are such as to command the confidence of the community in which the savings bank is proposed to be located. On authority to transact business being granted, the persons designated as trustees have the entire management and control of the affairs of the corporation. Residents of the state alone are eligible as trustees, and whenever a trustee of one bank becomes a trustee, officer, clerk or employee in any other savings bank, or upon borrowing, directly or indirectly, any of the funds of the bank of which he is a trustee, or becoming a surety or guarantor for money borrowed of or a loan made by the bank, or upon failure to attend regular meetings of the board or to perform any duties devolved upon him as a trustee for six successive months, without having previously been excused by the board, his office becomes vacant. But in the discretion of the board such trustees are eligible for re-election. The board of trustees elect from their number a president and two vice-presidents; and from their number or otherwise, elect or appoint such officers and clerks, whose salaries are fixed by the board, as they may see fit. Vacancies in the office of the trustees are filled by the board, which has power from time to

time to make such by-laws, rules and regulations as may be thought proper for the election of officers, for prescribing their respective powers and duties and the manner of discharging the same; for the appointment and duties of committees; and generally, for transacting, managing and directing the affairs of the corporation. Regular meetings of the board of trustees are required to be held as often as once in each month, at which at least seven trustees must be present. Trustees are prohibited by law from having any interest whatever, direct or indirect, in the gains or profits of their banks, or from, directly or indirectly, receiving any pay or emolument for their services, except that trustees acting as officers, whose duties require and receive their regular and faithful attendance at the bank, may receive such compensation as in the opinion of a majority of the board of trustees shall be just and reasonable, such majority to be exclusive of any trustee to whom compensation is voted; but it is not lawful to pay trustees, as such, for attendance at board meetings. No trustee or officer, for himself or as the agent or partner of others, can borrow the funds or deposits of the bank, or in any manner use the same, except to make current and necessary payments authorized by the board of trustees; nor can any trustee or officer become an indorser or surety, or in any manner an obligor for moneys loaned by or borrowed of his bank.

Savings banks are authorized by law to receive on deposit such sums of money as may be offered by individuals, corporations or societies, invest the same, and pay interest or dividends thereon. On making first deposit, banks furnish to each depositor a pass-book, in which all deposits and withdrawals are required to be entered. Such pass-book contains the rules and regulations of the bank, and is legal evidence between the corporation and the depositor as to the terms on which the deposit is made. The sums deposited, together with the accumulations, are required to be repaid to depositors or their legal representatives, after demand, in such manner, at such times, after such previous notice, and under such regulations, as the board of trustees may prescribe. The usual provision is for sixty days' notice, which is only demanded in time of panic to allay excitement. While depositors are not restricted as to the number of banks with which they may have accounts, the aggregate amount a single bank can hold to the credit of an individual is limited to three thousand dollars. Such limitation does not apply to deposits made by order of a court of record or a surrogate. Banks may refuse to receive deposits, or at any time return all or any portion thereof. Deposits made by minors or females are held for their exclusive benefit, free from control or lien of all persons whatsoever, except creditors.

It is made the duty of trustees to regulate the rate of interest or dividends on deposits not to exceed five per cent per annum, in such manner that depositors shall receive, as nearly as may be, all profits of the corporation after deducting necessary expenses and reserving such amount as may be deemed expedient, as a surplus fund for the security of depositors, which, to the amount of 15 per cent of deposits, they are authorized to gradually accumulate and hold, to meet any contingency or loss in business from the depreciation of securities or otherwise. When the surplus exceeds fifteen per cent of deposits, extra dividends may be declared. Savings banks are prohibited from declaring, crediting or paying dividends or interest except on authority of a vote of the board of trustees. When dividends are declared and credited in excess of the earnings of a savings bank, trustees voting therefor are jointly and severally liable to the bank for the excess so declared.

The securities in which investments may lawfully be made are stocks or bonds or interest-bearing notes or obligations of the United States, or those for which its faith is pledged; 3.65 bonds of the District of Columbia; interest-bearing stocks or bonds of the state of New York and those issued by cities, counties, towns or villages thereof, and the stocks or bonds of any state in the Union that has not, within ten years, defaulted in the payment of any part of either principal or interest of any debt authorized by any legislature of such state to be contracted; in bonds and mortgages on unincumbered real estate, situate in the state and worth at least twice the amount loaned thereon. But not more than sixty per cent. of deposits can be so loaned. In case the loan is on unimproved and unproductive real estate, the amount is restricted to forty per cent of actual value. No loan on bond and mortgage can be made except upon the report of a committee charged with the duty of investigating the same, who certify the value of the premises according to their best judgment, which report is filed and preserved among the records of the institution.

Trustees are required to invest the moneys deposited with them, in the securities enumerated, as soon as practicable, except that, for the purpose of meeting current payments and expenses in excess of receipts, there may be kept an available fund of not exceeding ten per cent of the whole amount of deposits, which may be kept on hand or on deposit with banks or trust companies to an amount not exceeding 25 per cent of their paid-up capital and surplus. Or such available fund or any part thereof may be loaned on the pledge of such securities as savings banks are by law authorized to invest in. The real estate that they may hold and convey is such as may be requisite for a banking-house, the cost of which is limited to fifty per cent of the surplus of the bank, and such as may be purchased at sales upon foreclosure of mortgages owned by the bank, or upon judgments or decrees obtained upon debts due to it, or in settlements effected to secure such debts.

Trustees are prohibited from loaning the moneys deposited with them, upon notes, bills of exchange, draft or other personal securities, and it is unlawful for savings banks to deal or

trade in any goods, wares, merchandise or commodities whatever, except as expressly authorized; or in any manner to buy or sell exchange, gold or silver, or to collect or to protest promissory notes, or time-bills of exchange. And no savings bank can lawfully make or issue any certificate of deposit, payable either on demand or at a fixed day, nor pay any interest except regular quarterly or semi-annual dividends upon any deposits or balances, nor pay any interest or deposits, or portion of a deposit, or any check drawn upon itself by a depositor, unless the pass-book of the depositor be produced and the proper entry be made therein at the time of the transaction.

Every savings bank is required to make a full report in writing of its condition at least twice in each year, verified by the oaths of the two principal officers of the bank. The reports made for January and July are based on examinations of assets and liabilities made by a committee of not less than three trustees; the accuracy of the examinations is required to be verified by the oaths of the trustees making the same. An accurate balance of the depositors' ledgers is also required to be taken semi-annually, and if there be discrepancies between them and the general ledger of the bank, the fact must be stated in the semi-annual report.

The bank superintendent makes annual reports to the legislature of the condition of all the savings banks in operation in the state; he also, at least once in two years, either personally or by some competent person, visits and examines each savings bank transacting business in the state. The superintendent may cause special examinations to be made whenever he deems it necessary or expedient. On such examinations, persons whose testimony is required may be compelled to appear and testify. If at any time it appears to the superintendent, from examinations or reports, that any savings bank has committed a violation of its charter or of law, or is conducting business in an unsafe or unauthorized manner, he is required to direct the discontinuance thereof; and whenever such corporation refuses or neglects to comply with his order, or whenever it appears that it is unsafe or inexpedient for any such corporation to continue to transact business, or that any trustee or officer of a savings bank has abused his trust, or been guilty of misconduct or malversation in his official position injurious to the bank, or to its depositors, the superintendent communicates the facts to the attorney-general, who institutes such proceedings as the nature of the case requires. The proceedings instituted by the attorney-general may be for the removal of one or more of the trustees, or for the transfer of the corporate powers to other persons, or to the consolidation and merging of the corporation in any other savings bank that may be willing to accept the trust, or for such other relief or correction as the particular facts communicated to him shall seem to require. In the event of a savings bank being put into liquidation, its assets are required to be distributed within eighteen months. The advertising as savings banks, by individuals or corporations, without lawful authority, is prohibited under heavy penalties.

SAVORY, an herb. See HORTICULTURE, Vol. XII, p. 302.

SAVOY. THE. See LONDON, Vol. XIV, pp. 848, 855.

SAVOY CONFERENCE, a meeting held in 1661 in England under warrant of Charles II. Twelve bishops of the church and twelve Presbyterian divines were to agree on a revision of the liturgy of the *Book of Common Prayer*. It was opened on April 15, to last four months, at the lodgings of Sheldon, bishop of London, at the Savoy in the Strand in that city. Sheldon, with great caution, first pointed to the fact that his party asked for no changes in the prayer-book, and then requested the others to make proposals for alterations in writing. The latter at once set to work to prepare a case, while Richard Baxter himself undertook to write a revised liturgy, which he finished before his colleagues were ready with their petition to the bishops, which was not presented until May 4. In this they declared that the old liturgy, though a worthy work, was drawn up "to win upon Papists" and that the time had come for changes to win Presbyterians. They objected to many things, to the word "priest," to lent, to the exclusion of extemporary prayer, to short broken collects, etc. They wished one long, continuous form of prayer, a lengthened catechism and that the cross in baptism, as also the surplice and kneeling in communion, should be optional. The petition was long and tedious, the church divines could not commend the alterations proposed and they showed that the members of the church had for generations been satisfied with the liturgy as it was. Obsolete languages, they said, could be amended, but the form of the liturgy was founded on ancient and well-established models. The concessions which they made were fourteen in number, touching the wording of certain formularies and a few matters of ceremonial and discipline. The petitioners were not ready with a reply until ten days only of the four months remained. The debate that ensued had not come to an end when the four months' term expired. The conference came to nothing, and the members could only report that they could well agree on the ends for which they met, but "as to the means they could not come to an harmony." The House of Commons, becoming impatient, appointed a committee to investigate the history of, and to frame alterations in, the *Prayer Book*, and on July 9 it passed a bill of uniformity. The Commons thus decided the whole question before the conference adjourned. W.R.B.

SAW-FISH. See RAY, Vol. XX, p. 311.

SAWING-MACHINES. Saws for use in machines are made in three forms—circular, band, and straight. Within a few years there has been developed an improved construction of machines

using circular saws. It consists in using two circular blades instead of one, the advantage being that a thinner kerf is thus obtainable, admitting of faster cutting and a saving of lumber. The second saw is placed above and slightly to the rear of the first saw in the same plane, and is made to rotate in the same direction, though acting oppositely upon the lumber. As the saws used for any one size require to be only one half the diameter with this arrangement, as where one only is used, it follows that they can be made thinner and driven faster. For log-sawing machines the carriage is usually moved by a rack-and-pinion feed, though ropes are also used. A steam-piston device, suitable for rapid work, has been named the "shot-gun" feed.

Re-sawing machines are so named because used by local lumber-dealers to reduce their lumber from certain large standard sizes to smaller dimensions suited to their home trade. They are lighter than the log-saws, and commonly have four upright feed-rolls and one circular saw. In the larger sizes the saws are made sectional, because this plan allows of a thinner blade and consequently thinner kerf. A great variety of sawing-machines are made specially for ripping or cross-cutting, or for a combination of one of these with gaining or grooving. One pattern of saw useful for small cross-cutting is the swing-saw, also called pendulum-saw, which depends from a frame attached to the ceiling, and is swung against the work. The saw-table is a table whose inclination is adjustable by means of screws and weights, and through which a small circular saw protrudes. There are numerous forms, as for making slats, pickets, laths, etc.

Band-saws are increasing in use. They are largely used for resawing. The prevailing type has two large wheels, over which the endless blade runs. Those made by the Egan Company have iron wheels with steel spokes and sometimes rubber tires, the lower wheel being made the heaviest. A six-roll feed is used, also a device of adjustable slides to guide the band. Where band-saws are used in log-mills, a saw-deflector is often used to keep the blade in line.

Two types of machines are built to use straight saws. They are the drag-saw, used for cutting logs in two, and the jig-saw, used for light ornamental work. In the best forms of the latter the strain is balanced by a spring, and in some recent machines the strain is kept constant at all parts of the stroke by counteracting the loosening flexibility of the spring with an eccentric roller that varies the leverage at each point of the stroke.

Metal-working saws are coming into increased use. Circular blades are used. Some are toothed, and some are plain, toothless disks that cut the metal by the friction of rapid rotation. They will sever steel bars four inches square and beams 16 inches deep. One form, designed for trimming armor-plates, has two 36-inch diameter saws, which will trim both sides of a plate at one operation, or which can be used as independent machines. The Newton band-metal saw is used for cutting centers out of cranks, connecting-rods, pump-levers, etc., and for irregular work that can be guided by hand. The bottom wheel is run in a bath, to lubricate the saw.

Among sawing-machines for special purposes are the marble-saw, which has a toothless blade and is used with abrading sand to cut marble; the barrel-saw, cylindrically shaped, for cutting barrel-staves; the weather-boarding saw, arranged for cutting a log radially from the center, so as to get out weather-boards with the least waste of material; the stockers' saw, especially designed for shaping the stocks of firearms; the comb-saw, having two parallel blades, which cut the spaces between the teeth of combs; and many others.

C. H. Cochrane.

SAW-MILL. See Saws, Vol. XXI, pp. 359–361.

SAWS. See Tool-Making, in these Supplements.

SAWYER, Philetus, an American statesman; born in Whiting, Vermont, September 22, 1816. When he was a year old his father removed to Essex County, New York, where his childhood and youth were passed among the mountains and forests of the Adirondacks. In 1846 he removed to Wisconsin where in 1857 and in 1861 he was a member of the state legislature. He was a Republican of Free-Soil Democratic antecedents, and in 1864 was elected to Congress. From 1865 to 1875 he was continued in the House of Representatives and retired, after a continuous service of ten years. In the Forty-third Congress he was chairman of the Pacific railroad committee. Eight years he was on the committee on commerce. From 1881 to 1893 he served as United States Senator from Wisconsin. He died in Oshkosh, Wisconsin, March 20, 1900. W.M.C.

SAWYER, Thomas Jefferson, educator; born in Reading, Vt., Jan. 9, 1804; was graduated at Middlebury College in 1829; entered the Universalist ministry, and held pastorates in New York City in 1830–45 and 1852–61. He was editor of *The Christian Messenger* in 1831–45; in charge of the Clinton Liberal Institute at Clinton, N. Y., in 1845–52; editor of *The Christian Ambassador* in 1863–66; and on the opening of Tufts Divinity School in 1869 became professor of systematic theology there, and was made dean in 1882. He was active in the founding of Tufts College, the Canton Theological School, and St. Lawrence University, and was president of the first board of trustees of each of these institutions. He was twice elected president of Tufts College, once of Canton Theological School, and once of Lombard University. He wrote *Who is God — the Son or the Father?; Endless Punishment*, etc. He died in Boston, Mass., July 24, 1899. B.S.

SAXE, John Godfrey, poet; born in Highland, Vt., June 2, 1816; was educated at Wesleyan University, Middletown, Conn., and at Middlebury (Vt.) College, being graduated from the latter in 1839; studied law in Lockport, N.

Y., and in St. Albans, Vt., and was admitted to the bar in 1843. He was superintendent of public schools of Chittenden County, Vt., in 1847–48; purchased the Burlington (Vt.) *Sentinel* in 1850 and published it till 1856. In the latter year he was appointed United States deputy collector of customs; in 1859 and 1860 was defeated for governor of Vermont; and in 1872 became an editor of the Albany (N. Y.) *Evening Journal*. He early distinguished himself as a popular lecturer and a fluent writer, and became especially noted for his humorous verse. Sixteen editions of his works in poetry had been published up to 1860, and at the time of his death the number was increased to forty in the United States and England. Mr. Saxe for many years prior to his death gave all his time to lecturing and writing, but during the closing months of his life he fell a victim to mental depression, and secluded himself in Albany, N. Y., where he declined company. He was well known as a contributor to *Harper's New Monthly Magazine* and *The Atlantic Monthly*, and also for his recitals of original poems at college anniversaries and similar functions. His best known poems include *Progress, a Satire; Literature and the Times; The Money King; The Press;* etc. He died in Albany, N. Y., March 31, 1887.

E.O.W.

SAXE-COBURG AND GOTHA. See Vol. XXI, p. 363. According to recent statistics the area of the duchy is 756 sq. miles, Coburg having 217, and Gotha 539; and the population in 1900 was 229,567,—68,430 in Coburg, and 161,137 in Gotha. In 1899 the common revenue was $552,250, and the expenditure, $713,236; and on July 1, 1897, the public debt was, for Coburg, $711,046, and for Gotha, $34,811. The capitals, with their populations in 1900, are Gotha, 34,651, and Coburg, 20,460. In 1895 the duchy had 29,458 farms, which supported a population of 60,633, the chief crops being oats, barley, rye, wheat, potatoes, and hay. There are 173 miles of railroad. On the death of Duke ERNEST II (Vol. V, Suppl.), on Aug. 22, 1893, he was succeeded by his nephew, ALFRED, Duke of Edinburgh, since dead (Vol. I, in these Suppl.), on the death of whose only son, Prince Alfred (born Oct. 15, 1874), on Feb. 6, 1889, at Meran, in Austria, the DUKE OF CONNAUGHT (Vol. V, see Suppl.), brother of the reigning duke, became heir presumptive. On June 30, 1899, however, the Duke of Connaught and his son, Prince Arthur, renounced their claims to the succession in favor of Charles Edward, Duke of Albany (born July 19, 1884), son of the late Prince Leopold of England and Princess Helena of Waldeck.

SAXIFRAGACEÆ, a large family of polypetalous plants, closely allied to the rose family, but distinguished from it chiefly by having albuminous seeds, ovaries partly or wholly united, and seldom any stipules. The best-known genera are *Ribes* (currants and gooseberries), *Philadelphus* (syringa), *Deutzia*, *Hydrangea*, and *Saxifraga*.

SAXON LANGUAGE. See GERMANY, Vol. X, p. 462.

SAXONS. See SAXONY, Vol. XXI, pp. 366–367.

SAXONY. See SAXONY, Vol. XXI, pp. 366–375. The area of Saxony is 5,787 square miles; the population, in 1905 was 4,508,601. The following table gives latest figures by chief governmental districts:

DISTRICTS.	AREA, ENGLISH SQ. MILES.	POPULATION DEC., 1900.	DENSITY PER SQ. MILE.
Bautzen	953	405,092	425.1
Dresden	1,674	1,216,044	726.5
Leipsic	1,378	1,059,273	768.7
Zwickau	983	727,453	740.0
Chemnitz	799	791,296	991.1
Total	5,787	4,199,158	725.7

According to the census of Dec. 1, 1900, there were 12 towns with a population of over 20,000:

Leipsic	455,089	Zittau	30,921
Dresden	395,349	Glauchau	25,679
Chemnitz	206,584	Reichenbach	24,491
Plauen	73,891	Bautzen	26,024
Zwickau	55,829	Crimmitschau	22,840
Freiberg	30,175	Meerane	23,851

King Albert had in 1898–99 a civil list of $747,867 per annum, exclusive of the appanages, or dotations, of the princes and princesses, amounting to $154,709. The former royal domains, consisting chiefly of forests, became in 1830 the property of the state.

CONSTITUTION AND GOVERNMENT. According to the terms of the present constitution, first adopted in 1831, but largely altered since that date, the crown is hereditary in the male line; but at the extinction of the latter, also in the female line. The sovereign comes of age at the completed eighteenth year, and, during his minority, the nearest heir to the throne takes the regency. The legislature is jointly in the King and Parliament, the latter consisting of two chambers. The Upper Chamber comprises the princes of the blood royal who are of age; twelve deputies elected by the owners of nobiliar estates; ten noble proprietors and five other members without restriction, nominated by the King for life; the burgomasters of eight towns; and eleven other representative dignitaries, including a deputy of the University of Leipsic. The Lower Chamber consists of 37 deputies of towns and 45 representatives of rural communes. Both houses may introduce new laws. No taxes can be made, levied, or altered without the sanction of both chambers. The executive is in the King and in the Ministry of State, and in the separate ministries of Justice, of Finance, of the Interior, of War, of Foreign Affairs, and of Education and Ecclesiastical Affairs.

FINANCE. The budget estimate for revenue and expenditure for each of the two years, 1900 and 1901, was $23,047,500. There was, besides, for the two years 1898–99, an extraordinary revenue and expenditure of $25,345,837. More than half the total revenue is derived from public domains and railways, the net income from railways (1,866 miles) amounting in 1899 to $8,620,000. The public debt in 1901 was $207,455,600, incurred mostly in the purchase and building of railroads.

PRODUCTION AND INDUSTRY. There were in

1895, 193,627 separate farms, supporting a population of 517,642. On May 1, 1900, there were 548,353 factory operatives and 19,622 factories.

INSTRUCTION. Saxony is divided into 28 school-inspection districts. On May 1, 1900, there were 2,253 public Protestant and 45 Roman Catholic common schools, 71 private and chapter schools, and 1,971 advanced common schools (Fortbildungsschulen); total, 4,340 common schools, with a total attendance of 792,186. There were also 1 polytechnic at Dresden (1,073 students in 1900), 1 mining-school at Freiberg, 1 forestry school at Tharandt, 1 veterinary school at Dresden, 17 gymnasia, 10 realgymnasia, 30 realschulen, 19 seminaries, and 2 girls' high-schools; altogether, 82 educational establishments, with a total attendance of 19,301, exclusive of the university and a large number of industrial, commercial, agricultural, musical, and art institutes. The University of Leipsic, founded in 1409, and attended in 1907 by 4,148 students, is one of the largest in Germany.

RELIGION. The royal family is of the Roman Catholic confession, but the vast majority of the inhabitants are Protestants. In 1895 the distribution of the different sects was as follows: Lutherans, 3,611,670; Roman Catholics, 140,285; Reformists, 10,538; other Christians, 15,059; Jews, 9,902; unclassified, 234. Ecclesiastically, in 1897 the kingdom was divided into 1,005 Lutheran parishes, and 37 Roman Catholic parishes.

COMMUNICATION. At the end of 1906 there were 2,018 miles of railway in Saxony (268 miles being in neighboring territories) and 35 miles belonged to private companies, but were worked by the state.

SAXTON, JOSEPH, inventor; born in Huntington, Pa., March 22, 1799; was placed in a nail factory conducted by his father when twelve years old. In 1817 he went to Philadelphia, Pa., and secured employment there with a watch-maker. Subsequently while working with Isaiah Lukens, a noted machinist, he made an astronomical clock, with a compensating pendulum, for which he designed a new plan of escapement. He went to England about 1830, and there invented electrical apparatus, which brought him renown not only there but in the United States. In 1837 he returned to Philadelphia and became constructor and curator of the standard weighing apparatus at the United States mint, and there designed and made standard balances for use in the annual inspection of the assays and standard weights for all the government coining and assay offices in the country. He designed an automatic instrument for measuring the height of the tide, a locomotive differential pulley, etc. He died in Washington, D. C., Oct. 26, 1873. E.O.W.

SAY, town in central Sudan, on the north bank of the Niger, in 13° 5′ N. Lat. Pop. 8,000.

SAY, JEAN BAPTISTE LÉON, a French statesman and economist; born in Paris, June 6, 1826. He was educated at the Collège de France, and early began the study of political economy. As one of the editors of the *Journal des Débats* he came into prominence during the third republic and under the second empire. He exercised a great influence on the financial administration of the country. In February, 1871, he was returned to the National Assembly by one of the departments of the Seine. Toward the end of the same year he visited London, and was entertained at a public banquet at the Mansion House. As a Republican, in 1872, he accepted the portfolio of minister of finance under M. Thiers, and negotiated a guarantee from the Rothschilds for the payment of the war idemnity. He accepted the same portfolio in 1875 under M. Buffet, though opposed to his monarchial leanings, and retained it in 1876 under Dufaure and under Jules Simon. He held the same position in Dufaure's second ministry, and also in President Grévy's first cabinet. He was president of the International Monetary Conference held in Paris in 1878, and in 1880 was appointed French ambassador in London. He was chosen president of the Senate in 1881, and again became minister of finance in M. de Freycinet's cabinet of 1882. He was an authority on economic and financial questions, to which fact his frequent appointment as minister of finance was no doubt due. He published *Histoire de la Caisse d'Escompte; La Villa de Paris et le Crédit Foncier* and *Les Obligations Populaires*. He translated Goschen's *Theory of Foreign Exchanges* into French (1866). He also published a *Dictionnaire des Finances*, a standard authority upon French financial practice and his *Les Finances de la France*, in four volumes, gather together his various expositions of financial questions arising during his long career. He died in Paris, April 21, 1896. W M.C.

LÉON SAY.

SAY, THOMAS, naturalist; born in Philadelphia, Pa., July 27, 1787; was educated in a Quaker school and afterward entered his father's drug store. He later engaged in business with John Speakman, through whose influence he became identified with the Academy of Natural Sciences of Philadelphia in 1812. Soon after this date he began to study American fauna and became so devoted to his investigations of this subject that he withdrew from business and spent the remainder of his life in its pursuit. In 1819 he was appointed naturalist in Long's expedition to the Rocky Mountains, and later accompanied the same leader in his expedition for the exploration of the sources of the Mississippi. He published many papers and *American Entomology* and *American Conchology*. He died in New Harmony, Ind., Oct. 10, 1834. E.O.W.

SAYCE, ARCHIBALD HENRY, Orientalist. He was born at Shirehampton near Bristol, March 26, 1846, became scholar at Oxford in 1865, was ordained priest in 1871, and in 1876 was chosen deputy professor of comparative philology at Queen's College. In 1891, however, he exchanged

this professorship for the chair of Assyriology, which he now holds. Partly on account of his health, he resided in Egypt, where he was able to prosecute much fruitful investigation. He extended his journeys to Syria and Asia Minor, devoting long periods to the study of the languages and the inscriptions. He was among those who led the way in the labor of reading and interpreting Hittite inscriptions, throwing much light upon them by comparison with the records which are furnished by investigation in Egypt. The hieroglyphs are partly ideographic and partly phonetic. Hittite hieroglyphs were of native origin Dr. Sayce has made extensive contributions to linguistics as is shown by his publications: *An Assyrian Grammar for Comparative Purposes* (London, 1871); *An Elementary Grammar and Reading-book of the Assyrian* (1077), *Acadian Phonology* (1877), and *Introduction to the Science of Language*. Other works of his are *Lectures on the Origin and Growth of Religion* (1887); *Records of the Past* (6 vols., 1888–1893), *The Higher Criticism* and *The Verdict of the Monuments* (1894). *The Egypt of the Hebrews and Herodotus* (1895), *Early Israel and the Surrounding Nations* (1898), and *Religions of Ancient Egypt and Babylonia* (1892). Dr. Sayce is the author of many essays and contributions to periodicals. His own thorough studies have qualified him to criticize the higher critics. W.R.B.

SAYRE, Lewis Albert, an American surgeon, born in Madison, New Jersey, February 29, 1820. He was graduated from the College of Physicians and Surgeons, New York, in 1842. In the same year he became prosector to the professor of surgery in the New York Institution. He was surgeon to Bellevue Hospital from 1853 to 1873. He published *Practical Manual of the Treatment of Club-Foot; Lectures on Orthopædic Surgery*, and *Spinal Curvature and Its Treatment*. He died in New York city, September 21, 1900. W.M.C.

SBARRETTI, Donatus, clergyman; born in Montefranco, Italy, Nov. 12, 1856; was educated at the Seminary of the Archdiocese of Spoleto, and at the College of St. Apollinaris, Rome; was a professor *ad interim* at the College of the Propaganda, Rome; and was ordained priest in the Roman Catholic Church, April 12, 1879. For eight years he was professor of speculative and moral philosophy in the College of the Propaganda; was sub-secretary of Propaganda on affairs pertaining to the United States; made private chamberlain to Pope Leo XIII., with the title of Monsignore; first auditor of the Apostolic Delegation at Washington in 1893–1900; consecrated bishop of Havana, Feb. 4, 1900; appointed Apostolic delegate to the Philippine Islands, September, 1901; and became Apostolic delegate to Canada in November, 1902. B.S.

SCAB, in plants, a general name given to those diseases, caused by parasitic fungi, which give rise to roughened surfaces, as apple-scab, pear-scab, grape-scab, potato-scab, etc.

SCAB, a sheep disease. See Veterinary Science, Vol. XXIV, p. 223.

SCABBARD-FISH, a name given to *Lepidopus argenteus*, or to other members of the family. They are long, ribbon-like fishes, with pointed head and long dorsal fin. Sometimes they are found on the European coasts of the Mediterranean. In New Zealand it is considered a fine food-fish. The name was suggested by the general form resembling a sword-scabbard.

SCABIES. See Parasitism, Vol. XVIII, p. 275.

SCAD, the popular name of fishes of the genus *Trachurus*, found in the Mediterranean, in the British seas, and on Atlantic and Pacific shores of America. Large quantities are preserved in salt. The big-eyed scad or goggle of topical seas belongs to the genus *Trachurops*.

SCAGLIOLA. See Building, Vol. IV, p. 455.

SCALA. See Verona, Vol. XXIV, p. 187.

SCALDHEAD or FAVUS. See Medicine, Vol. XV, p. 826; and Parasitism, Vol. XVIII, p. 274.

SCALE. See Music, Vol. XVII, p. 87.

SCALE, in measurement. See Surveying, Vol. XXII, p. 745.

SCALES, of fishes. See Ichthyology, Vol. XII, pp. 675–677; of Mammals, Vol. XV, p. 351; and of Reptiles, Vol. XX, p. 458.

SCALLOPS, widely distributed bivalve molluscs of the order *Pseudolamellibranchiata*, family *Pectinidæ*, comprising more than a hundred species. They are sometimes known as pectens and are remarkable for the beauty of their coloration and form. In most species the valves are equal but in the common edible scallop the right valve is convex and the left flat. The shell of *Pecten jacobæus* was worn as a badge by pilgrims who had been to the Holy Land. R.W.C.

SCAMANDER, a river. See Asia Minor, Vol. II, p. 618.

SCANDINAVIAN MYTHOLOGY. See Æsir, Vol I, pp. 189, 190; and Mythology, Vol. XVII, p. 162.

SCANDIUM. See *New Elements*, under Chemistry, in these Supplements.

SCANSORES. See Ornithology, Vol. XVIII, p. 34.

SCAPHIOPUS, a North American genus of toad-frogs belonging to the family *Pelobatidæ* and closely allied to the spade-footed toads of Europe. They are called toad-frogs since they come neither under the designation of toads or frogs, but resemble both. R.W.C.

SCAPHOPODA. See Mollusca, Vol. XVI, pp. 688, 689.

SCAPULA. See Anatomy, Vol. I, p. 725.

SCAPULARY. See Costume, Vol. VI, p. 410.

SCARABÆUS or SCARAB. See *Sacred Beetle*, under Coleoptera, Vol. VI, p. 119. For the gem, see Etruria, Vol. VIII, p. 564.

SCARBOROUGH, William Saunders, educator; born in Macon, Ga., in 1852; was graduated at Oberlin College in 1875; afterward studied at the Oberlin Theological Seminary; was professor of classical Greek at Wilberforce Uni-

versity for 19 years, and professor of Hellenistic Greek at the Payne Theological Seminary of Wilberforce University in 1891–95; and afterward vice-president and professor of ancient languages there. He has published numerous works, among them: *First Lessons in Greek* (1881); *Theory and Function of the Thematic Vowel in the Greek Verb; Our Political Status* (1884); *Birds of Aristophanes: a Theory of Interpretation* (1886); etc. He is of the negro race. B.S.

SCARFOGLIO, SIGNORA, an Italian novelist, better known as Matilde Serao; born in 1856, in Greece, her father being a political exile, who married Princess Scanary. Left an orphan at an early age, she was thrown upon her own resources, and obtained employment as a telegraph operator and later as a newspaper correspondent. She then commenced to write fiction, and became known about 1873 as the author of *Apale* and *Picolo.* She has been a prolific writer of realistic tales, reflecting Neapolitan life and color. In 1891 one of her books appeared in English with the title *Fantasy*, the volume being prefaced with a critical estimate of her work by Edmund Gosse.

SCARLATINA. See SCARLET-FEVER, XXI, pp. 393–395.

SCARUS, a genus. See PARROT-FISHES, Vol. XVIII, p. 329.

SCHACK, ADOLF FRIEDRICH (1815–94), a German poet and orientalist. See CALDERON, Vol. IV, p. 585.

SCHAEBERLE, JOHN MARTIN, astronomer; born in Germany, in 1853; was brought to the United States in infancy, the family settling in Ann Arbor, Mich. In 1876–78 he was private assistant to Professor Watson; in 1878–88 was an assistant at the Ann Arbor Observatory and instructor and acting professor of astronomy at the University of Michigan; in 1888–98 was astronomer of the Lick Observatory at Mt. Hamilton, Cal.; and in 1889, 1893, and 1896 was in charge of the eclipse expeditions of the Lick Observatory to Cayenne, Chili, and Japan. Professor Schaeberle has discovered three comets.

G.J.H.

SCHAEFFER, CHARLES WILLIAM, theologian; born in Hagerstown, Md., May 5, 1813; was graduated at the University of Pennsylvania in 1832; entered the pastorate of the Southern Church; was identified with the General Council in the controversy resulting in the separation of that body from the General Synod; chairman of the faculty of the Southern Theological Seminary at Mt. Airy in 1881–94; several times president of the Pennsylvania Synod and of the General Council; and president of the Board of Foreign Missions of his church. His most noteworthy publications were *The Early History of the Southern Church in America; Family Prayer: a Book of Devotions*; and *Halle Reports*, with valuable annotations; but he was also widely known for his work in hymnology, translating into English a large number of old German hymns. He died in Philadelphia, March 15, 1896.

G.J.H.

SCHAEFFER, NATHAN C., educator; born in Berks County, Pa., Feb. 3, 1849; professor in Franklin and Marshall College in 1875–77; principal of the Keystone State Normal School in 1877–93; secretary of the College and University Council of Pennsylvania; chancellor of the Pennsylvania Chautauqua at Mt. Gretna; and since 1893 state superintendent of public instruction in Pennsylvania. He has published *History of Education in Pennsylvania* and *Thinking and Learning to Think* (1900); edited the *Pennsylvania School Journal* since 1893. G.J.H.

SCHAFF, PHILIP, clergyman; born in Coire, canton of Grisons, Switzerland, Jan. 1, 1819; was educated in Coire, and at the universities of Tübingen, Halle, and Berlin. Through the influence and advice of several noted German scholars he was made professor of church history and Biblical literature in the theological seminary of the German Reformed Church of the United States at Mercersburg, Pa., and was installed there in 1844. He soon published a work entitled *The Principle of Protestantism as Related to the Present State of the Church.* His tolerant method of treating the Roman Catholic Church in this work and also his stand in holding that Protestantism was itself only a step in religious development led to a charge of heresy against him. He was tried in 1845 by a synod in York, Pa., but was acquitted. His book, however, brought about what was known as the "Mercersburg Controversy," which was not adjusted till 1881, when the "Peace Commission" was formed. His connection with the seminary was severed in 1863, and he removed to New York city. He was secretary of the Sabbath Committee in 1864–69. In 1869 he became instructor in church history, in 1870 professor of theological encyclopædia and Christian symbolism, in 1873 professor of Hebrew and cognate languages, in 1874 professor of Greek exegesis, and in 1887 professor of church history, all in the Union Theological Seminary. Dr. Schaff organized the American Bible Revision Committee in 1871, and was made its president. This committee cooperated with the British Committee in the production of the revised version of the Bible in 1881–85. He also established the American Society of Church History in 1888, and was its first president. As editor of *Lange's Commentary*, which was brought out in 25 volumes in 1864–80, he won much renown. His reputation rests principally on his extensive work in church history. His most valuable contribution to this realm of religious literature is the *History of the Christian Church.* It is the most learned and exhaustive work of its kind in the English language, and is cited at home and abroad as an authority. He was also the author of *Creeds of Christendom; Person of Christ;* etc. He died in New York city, October 20, 1893.

E.O.W.

SCHÄFFLE, ALBERT EBERHARD FRIEDRICH, a German sociologist and political economist; born in Nürtingen, Würtemberg, February 24, 1831.

JAN 30 1909
